In 1942 the government made compulsory an extraction rate from wheat of 85 per cent for bread making Extraction in peacetime had been 75 per cent. The object was to save shipping space for the importation of wheat, which was then seriously threatened by the submarine sinkings When the danger to our food supply diminished, the extraction rate was lowered first to 82 5 per cent and then to 80 per cent This reduction produced a storm of criticism because of the loss of vitamins in the higher extraction flour The government s defense was that new methods of milling enabled the percentage of extraction to be reduced without "appreciably lowering the vitamin B content. But this did not satisfy the critics who claimed that under the 85 per cent extraction the health of the population had been maintained in spite of the great restriction in diet resulting from war conditions Because of the world s shortage of wheat the government has gone back in two stages to the 85 per cent extraction, which has given rise in the House of Commons to the opposite protest, against people being compelled to eat the darker bread when they preferred white bread The question of the relative nutritive value of the two breads was again raised, but no official answer was given on this point It is unfortunate that, while it has been the subject of much discussion both by food experts and by leading physicians, no clear pronouncement has been made The fact that persons who enjoy a liberal diet can eat white bread with impunity seems to blind critics to its defects for those who have to make bread "the staff of life" The fact that natives who have excellent teeth when living on their primitive diets suffer from dental disease on a European diet, particularly one including white flour, is forgotten

### Preparatory Conference for World Health Organization

The Preparatory Committee of public health experts met in Paris from March 19 to April 6 under the egis of the Economic and Social Council of the United Nations to plan the international health conference One of the aims of this committee is to coordinate the work of the four existing international sanitary organizations The International Office for Public Hygiene, established in 1907, is located in Paris and diffuses and controls information regarding epidemic diseases and the application of international conventions and health measures in land, sea and air traffic During the war its action was restricted to occupied Europe. It was represented by its director Dr Robert Pierret, in a consultative capacity The Hygiene Section of the League of Nations with an epidemiologic and statistical service had as its delegate Dr Ives M Biraud UNRRA was represented by Dr Andrew Topping and Dr Neville Goodman The Pan American Sanitary Bureau had Dr Aristides A Moll, secretary as representative At the Paris conference Dr Rene Sand, counselor to the Belgian ministry of health, presided The United States was represented by Dr James A Doull, Surg Gen Thomas Parran, Dr H Van Z Hyde, all three of the Public Health Service, and Miss Marcia Maylott, technical adviser of the State Department Great Britain was represented by Dr Melville Mackenzie Sir Wilson Jameson, Mr G E Yates, Miss E A East, all of the Ministry of Health, and Dr C Lal Katial of the ministry of pensions Dr A Cavaillon, general secretary to the Ministry of Public Health, and Dr Leclainche represented France Dr G B Chilsholm, deputy minister of national health Canada Dr Martin Kacprzak, president of the National Health Council of Poland, Poland Dr Andriga Stampar, Yugoslavia, Dr Manuel Baez, vice chairman of the Preparatory Committee, Mexico, and experts from Czechoslovakia, Norway Switzerland, Brazil, Argentina, Greece, Egypt and India

The Preparatory Committee has been unanimous in recommending the establishment of a single world organization to function as a specialized agency in relation to the United Nations The committee is generally agreed that the new organization should continue and develop the international cooperation in health at present carried out by the aforementioned four organizations Among the more important responsibilities of the World Health Organization will be the stimulation of its member governments to maintain constant improvement of health services and to provide technical assistance on request. It is also proposed that the World Health Organization should promote research in the fields of medicine and health, making the findings of investigators everywhere available to every one An information service and facilities for the exchange of vital data will be at the disposal of all states participating

The proposed constitution also mentions the role of the World Health Organization in promoting conventions and regulations in international health and sanitary matters for initiative here will tend to equalize development in different countries and control epidemic and social diseases, which otherwise might spread unchecked.

The Preparatory Committee decided that the International Congress for Health will be held in New York on June 19

## PALESTINE

*(From Our Regular Correspondent)*

JERUSALEM, March 30, 1946

### Infection with Bovine Leptospirosis in Man in Palestine

The cooperation of clinicians and bacteriologists in the study of an endemic of jaundice resulted in the isolation of a new species of Leptospira by Bernkopf in Jerusalem Clinically, Leptospirosis in cattle was reported in 1942 by Freund, Traimn and Malkin but the micro organism responsible for the infection was not detected In calves the disease runs a similar course to that of Weil's disease in man, with high temperature, leukocytosis and increased urea values Isolated human cases reported in the past few years showed that almost exclusively individuals were attacked who had contact with animals, such as veterinarians, butchers and farmers

Serologically and in its pathogenicity, the strain of Leptospira isolated by Bernkopf differs in many respects from Leptospira icterohemorrhagica and Leptospira canicola Leptospira bovis (Bernkopf) could be experimentally transferred to calves A number of the infected animals developed jaundice and succumbed, others showed a milder variety characterized by rise of temperature, leukocytosis and increased urea values In the urine of these animals Leptospira was eliminated from three weeks up to two months after subsidence of the acute symptoms

The pathologic-histologic examinations of the experimentally infected calves was performed by Ungar In animals that had succumbed two to three days after the infection the liver showed a severe degree of dissociation of cords cholangitis with retention of bile in the bile ducts and erythrophagia in the reticuloendothelial system The kidneys showed nonpurulent, interstitial inflammation with some absorption of hemoglobin by the tubular epithelium In 3 of the calves in which the disease ran a milder course without jaundice the internal organs showed no particular changes, while in a fourth animal, which was killed after fifty-four days, only interstitial nephritis was found Examinations were also made in a third group of infected animals offering a more serious picture without, however, having developed jaundice. Here liver dissociation was of the same degree as in the first group, while the kidneys showed a mild degree of interstitial nephritis with only a few occasional focal necroses in the tubular epithelium After staining according to Levaditi, Leptospira could be identified in the liver and kidneys Similar pathologic-anatomic changes were reported by Casper and Reif for human beings and Leptospira was here detected in the liver

Clinical data concerning the disease are given by Padersky of Affulah and Btesch of Tel Aviv The onset is sudden, with violent conjunctivitis headache and abdominal pain, vomiting, muscular pain and high temperature After four to five days the temperature declines and jaundice may appear In contradistinction to infective hepatitis, the patient does not feel better after the subsidence of temperature, on the contrary, he grows toxic and may develop stupor or pass into a coma This toxic stage may be brief (one to two days) and is followed by a renewed rise of temperature During this second stage the renal complications usually make their appearance and in the majority of cases this is the time when nephritis develops, with retention of urea Leptospira appears in the blood of the patient during the first few days of the disease and can be detected in the urine after the seventh to tenth day After that time, positive agglutination can be obtained in the blood with specific Leptospira.

Therapeutically, Ephrati of Tiberias reports one success after penicillin treatment The administrations were started on the eleventh day at three hourly intervals In the course of eight days, a total of 1 million units was given, the patient simultaneously receiving vitamins $B_1$ and K, nicotinic acid and liver extract

These results, obtained by a close cooperation of clinicians and bacteriologists, have shown why so far no case of Weil's disease has apparently occurred in Palestine The L bovis now identified by Bernkopf differs serologically from L ictero hemorrhagica and L canicola. It is probably closely related to the Leptospira reported by Russian authors for cattle in the northern Caucasus (Michin, Azinow) A separate report on the results of these investigations will be given in a special issue of the Harefuah on March 1

### Relationship Between Eosinophilic Erythredema and Filariasis

The etiology of a special type of migrating and itching swellings of the skin associated with high eosinophilia of the blood is still imperfectly understood Since their first appearance coincided with the arrival of large contingents of colored troops in this country and since outwardly they present a striking resemblance to the so called calabar swelling, they were suspected to represent an early stage of filariasis However, microfilaria could not be detected in the blood in any single case Since in filariasis the cutaneous reaction yields positive results with a specific antigen, at two Palestine hospitals cutaneous tests were performed with antigen from Dirofilaria immitis

At the dermatologic outpatient clinic of the Hadassah University Hospital in Jerusalem, Dostrovsky and Sagher undertook skin tests in 12 cases of erythredema with a control series of 32 normal patients With a concentration of antigen of 1 1,000 all 12 cases yielded positive results after twenty-four and forty-eight hours With a concentration of 1 10,000, 10 cases showed a positive reaction after twenty-four hours, in 6 of which it continued to be present even after forty eight hours Of the control persons suffering from all kinds of skin diseases after twenty-four hours 14 showed a positive, the rest a negative reaction After forty-eight hours the picture was the same.

Three erythredema cases showed exacerbation of the original lesion, with redness and itching after the skin test. This would suggest a specific local reaction. Since, however, so many normal persons likewise showed a positive intracutaneous reaction, this test cannot very well be considered a specific one and the question of whether the eosinophilic erythredema should be considered a manifestation of filariasis remains further unsolved

Similar results were reported by Lass from the outpatient department of the Hadassah Municipality Hospital in Tel Aviv In 16 cases of eosinophilic erythredema antigen in concentration 1 8000 elicited an immediate reaction in 7, a late reaction in 8 and 4 patients remained negative. Among 20 control cases the reaction was positive in 3

## AN INSTITUTE FOR THE TREATMENT AND CARE OF THE DIABETIC

JOSEPH H BARACH M D
Pittsburgh

The following notes represent part of my experience to date with patients who, without my knowledge have been to the Kaadt Institute of South Whitley Ind in search of a cure for diabetes These patients stated that acquaintances or friends had urged them to go there, advising them that they could be treated or cured of diabetes and that they would be freed of the need for insulin injections I have reason to suspect that some of this propaganda is carried on by scouts who visit diabetic patients, diabetic clinics and hospitals One such incident known to me personally occurred in the diabetic clinic under my supervision and another at the Presbyterian Hospital in the guise of a nurses aide wearing a Red Cross uniform This young woman urged my patient to go to the aforementioned institute, where patients are 'cured' without the use of insulin

I am informed by my patients who have been there that a medical history of their cases was not taken that physical examinations were not made and that their blood sugars were not determined My record of 17 patients with diabetes who had been there for treatment reveals that 12 developed diabetic coma and were taken as emergency cases to various hospitals after the coma had existed for some time. Of these 12 patients, 5 died. Two deaths are known to other physicians, but details are not available at this time.

These cases were reported to me by one physician who had 4 patients, another who had treated 4 one who treated 2, and 2 were my own patients The remaining patients were treated individually by their own physicians

The mortality of 5 deaths in 12 cases of coma suggests that the patient probably held out against calling the family physician, relying on the medicines they were taking and were in deep coma before they reached the hospitals, beyond the stage of favorable mortality rate.

The treatment, according to my patients reports consists in dietary advice a box of tablets of unknown composition and the ingestion of a cider vinegar like mixture with added ingredients

The patient pays $30 for a gallon of the liquid and a package of tablets Neither of these that I have seen are labeled or their contents indicated After the medicine is used up the patient is expected to return to the institute for another supply, since the medicine is not sent to the patient by mail or express, so far as I know

### HIGHLIGHTS FROM LECTURES GIVEN AS RECORDED BY A PATIENT WHO LATER DEVELOPED DIABETIC COMA

#### LECTURE I

Clover or buckwheat honey is all you are allowed to take

Eat a little of everything every day

You are positively not allowed to eat grapes, watermelon, honeydew or cantaloupe.

Eat all kinds of meat except bologna Also eat all the vitamins you can

Whisky is the best thing for diabetes You can have a bottle of beer occasionally as long as you don't drink half a dozen Of course, you can overdo drinking

Acid burns the nerves and causes drowsiness

Diabetes is caused from shock 100 per cent

You can drink coca cola or root beer The sugar is already boiled

Take it easy on the candy and pop

There are several things that we know are not good for diabetics Among them are melons (watermelons cantaloupes, honeydews etc.), grapes or anything made from grapes (wine, jelly, etc)

Fresh fruits (apples pears peaches etc.) are very acid and should be used sparingly by any diabetic.

#### II. TYPEWRITTEN INSTRUCTIONS BROUGHT BACK BY ONE OF MY COMA PATIENTS

Sweet potatoes are better for the diabetic than white potatoes

Fresh fruits (apples, pears peaches etc) are very acid and should be used very sparingly by any diabetic

But among the things most diabetics have been taught to avoid but which in many cases are beneficial are

Ice cream
Cakes and pie
Milk and cream
All citrus fruits
Honey (clover or buckwheat only)
In fact most anything that is made with sugar that has been *thoroughly cooked*
Lots of lean beef

Meats eggs and fresh vegetables should provide 90 per cent of the diet. In many cases the diabetics lose weight at the beginning of this treatment, which should cause them no alarm for they will gain again in a short time If you think you are losing too rapidly eat more and drink lots of milk Even four meals per day if it is necessary But try not to interrupt the treatment. Insulin patients are more apt to do this than the nonusers of insulin.

If you will eat a little of many things you will not get enough of any one thing to do much damage. Try a little of each

# Correspondence

## TREATMENT OF UREMIA

*To the Editor* —In view of the remarkable result obtained by Frank, Seligman and Fine by peritoneal irrigation in a case of anuria due to sulfathiazole (THE JOURNAL, March 16) it may be pointed out that lately comparable results have been obtained by Dr W J Kolff with an artificial kidney The first results which Kolff obtained with this artificial kidney were published in the *Acta medica Scandinavica* (**117** 121, 1944) and have been commented on in an editorial in THE JOURNAL (May 26, 1945, p 288) Kolff has followed up his experiments with the artificial kidney and has now reported his later results in a thesis (Amsterdam January 16 in the Dutch language) He emphasizes that the construction of an efficient artificial kidney has been possible only since an efficient anticoagulant, heparin and a good dialyzer consisting of a cellophane tube 23 mm wide and 50 yards long have become available A cellophane tube is wound spirally around a cylinder which consists of a wooden lattice work with a coat of lacquer This cylinder rotates slowly, and the lowest part of the cylinder is submerged in a tank containing 70 to 100 liters of a solution of 0 6 per cent sodium chloride, 0.2 per cent sodium bicarbonate 0 04 per cent potassium chloride and 1 5 to 2 per cent of glucose A glass cannula is tied into a vein on the dorsum of the foot or in the forearm and a slow infusion of salt solution is started. Then another cannula is tied into the radial artery Only then is the patient heparinized with 1,200 mg of heparin or more. The glass cannula in the artery is connected by a rubber tube with a cellophane tube which acts as a dialyzer As the cylinder is turning continuously the blood is transported through the cellophane tube. After it has transmigrated through the whole length of the cellophane tube it is transported via another rubber tube in which a small pump has been built to the cannula, which has been tied in the vein. The cellophane tube is only partially filled with blood. Hereby a small amount of blood is spread over a large surface which greatly increases the rate of dialysis During the passage of the blood through the cellophane tube, large amounts of crystalloid substances of the blood are removed by dialysis As in the fluid against which the blood is dialyzed no calcium can be present because of the sodium bicarbonate content calcium is also removed from the blood. It is there-

fore necessary to give one or two intravenous injections of calcium gluconate to the patient during the dialysis

The dialysis lasts ten to fourteen hours. After the dialysis is finished the cannula in the artery and vein are closed off and left in situ for twenty-four hours. Then the coagulation time of the blood has returned to normal and the cannulas can be removed. The salutary effect of the vividialysis in the artificial kidney is demonstrated by the amount of the urea which is removed from the blood during this period. The largest quantity of urea dialyzed out amounted to 260 Gm. Even in cases in which the blood urea nitrogen before dialysis has risen to 160 mg. per hundred cubic centimeters one dialysis is sufficient to reduce this value to 45 mg. per hundred cubic centimeters. At the same time the increased nonprotein nitrogen, uric acid, creatinine and indoxyl of the blood descend to nearly normal values, and the xanthoprotein reaction of the serum diminishes significantly. Clinical signs of uremia usually disappear within twenty-four hours. It is evident that the artificial kidney will have only a temporary effect in patients with chronic nephritis and uremia. However, in instances in which an individual with previously competent kidneys suddenly develops loss of renal function the artificial kidney may well have a life saving action. Kolff cites 2 cases in which survival has at least partly been due to the purification of the blood in the artificial kidney.

*Case 1.*—A man aged 52 who had suffered from dilatation of the heart and auricular fibrillation since 1938 came down with a pneumonia in 1944. He was treated with sulfamethylthiazole 6 Gm. daily for two days. The temperature came down but rose again. There was evidently a relapse of the pneumonia, so that two weeks later he received 6 Gm. of sulfapyridine daily for two days. Thereafter anuria developed which lasted for four days. At that time there was a continuous hiccup and the blood urea had gone up to 103 mg. per hundred cubic centimeters. In view of the dilatation of the heart and the auricular fibrillation no further examination was ordered, but the patient was immediately treated with vividialysis in the artificial kidney. During a period of fourteen hours 50.8 liters of blood passed through the apparatus and 52 Gm. of urea was removed. The blood urea nitrogen went down to 47 mg. per hundred cubic centimeters and the condition improved considerably. However, the diuresis did not start until two days later, when cystoscopy and lavage of both renal pelves were performed. Thereafter urinary secretion set in and complete cure ensued.

*Case 2.*—A woman aged 67 was admitted with high fever, distension of the abdomen and a large inflammatory tumor around the gallbladder. There was slight jaundice and complete anuria. She evidently suffered from acute cholecystitis and pericholecystitis, which had led to a hepatorenal syndrome with shutdown of the kidney. On the eighth day of the anuria, cystoscopy and lavage of the renal pelves were performed, which however was not followed by diuresis. On the next day the blood urea nitrogen was 184 mg. per hundred cubic centimeters. Potassium of the serum was 55 mg. per hundred cubic centimeters and the carbon dioxide combining power 40 volumes per cent. The patient was comatose and could hardly be awakened by shouting. There was edema of the buttocks and legs.

Vividialysis in the artificial kidney lasted for eleven and one-half hours during which time 80 liters of blood passed through the apparatus and 60 Gm. of urea was removed. After the dialysis of the blood urea nitrogen had gone down to 57 mg. per hundred cubic centimeters and the potassium to 19 mg. per hundred cubic centimeters on the next day, uremic signs disappeared and the mental condition became completely normal. Diuresis gradually set in.

Two months later the general condition was excellent. The urine contained only a trace of albumin, and the blood urea nitrogen was normal, 23 mg. per hundred cubic centimeters.

It seems certain that at least in the second case the artificial kidney acted as a life saving device.

Isidore Snapper, M.D.,
Mount Sinai Hospital,
New York

## MEDICOLEGAL ABSTRACTS

**Charitable Hospitals—Right of Nonprofessional Employees to Strike and Picket.**—The plaintiff, Society of the New York Hospital, filed an action to restrain the New York Building and Construction Trades Council's Maintenance Organization, A. F. of L., from causing any strike of the plaintiff's employees and from picketing in front of the plaintiff's hospital. The case was tried in the Supreme Court, special term, New York County.

The plaintiff is a public, charitable, nonprofit and nonsectarian corporation engaged in the operation and maintenance of a general hospital in the city of New York for the care and treatment of the sick and injured and for the advancement, through research and teaching, of preventive and curative medicine. In addition to its professional staff, the plaintiff employs approximately 2,500 persons, including employees working in the hospital's power plant, elevator operators and maintenance men such as electricians, mechanics, plumbers, carpenters, painters and upholsterers. The hospital is wholly dependent on its power plant for electricity to light and heat its premises and to operate such equipment as oxygen tents, respirators, incubators, sterilizers and other instruments and machines recognized as essential to the proper operation of a hospital. On Nov. 19, 1945 about 116 nonprofessional employees, including power plant workers, elevator operators and maintenance men, failed to report for work following a statement made two days previously by an officer of the defendant union to plaintiff's officers that some workers would not report on that day because conferences between plaintiff and defendants had apparently reached an impasse. These workers had not, at the time of the hearing, returned to their jobs, and their absence handicapped plaintiff in the performance of its functions. Also on November 19 members of the defendant union and employees of the plaintiff picketed in front of plaintiff's hospital. The picketing was, however, discontinued late that day pursuant to a temporary restraining order.

The Labor Law of New York (art. 20, sec. 700-715) provides for the creation of a Labor Relations Board. After defining the right of employees to organize and bargain collectively and prohibiting certain unfair labor practices by employers, it specifically exempts from its terms the employees of charitable, educational or religious associations or corporations. The plaintiff concedes that its employees have the right to organize for the purpose of collective bargaining, to attempt to bargain collectively with the plaintiff, and to assert and advertise their alleged grievances in any proper manner, it concedes that both the strike and the picketing performed by the defendant were entirely peaceful, unaccompanied by violence, misrepresentations, fraud or excesses of any kind, but it contends that the Labor Law in excluding from its benefits the employees of charitable, educational or religious associations or corporations, sets forth a public policy removing them from the pale of legal protection and outlaws any strike or strike supporting activities by such employees.

This raises, said the court, a very interesting question of statutory interpretation. Obviously, the legislature chose to single out the excepted categories for cogent reasons of public policy but there may well be charitable, educational or religious activities in which such interference would constitute a relatively minor or negligible nuisance. On the other hand, there are some occupations not excluded from the applicability of the Labor Law in which strikes and strike supporting activities might nevertheless be enjoined. It is the court's duty in each case, the opinion continued, to determine the purposes and objectives which workers embraced in the exempt categories may lawfully attempt to achieve by striking. In so doing the court must weigh the public interest against that to be served by allowing

such workers to obtain fair treatment through the utilization of those economic weapons which are available to them The right to strike has proved to be of proper potency to labor in our industrial history, but there are some contravening considerations which can be of even greater importance to the public interests as a whole. It is difficult to conceive of a public service of greater value than the maintenance of hospitals for the care of the sick and the injured and it is almost impossible to conceive of such hospitals functioning properly if they are subject to interference by strikes or otherwise Ministration to the sick cannot be delayed, surgical operations, as well as the routine care of those requiring medical attention, must be permitted to proceed at all times, the effective strength of medicines and serums must be preserved continuously under scientific conditions, the frantic immediacy required for the treatment of emergency cases cannot be suspended while awaiting the outcome of parleys between the hospital management and its employees over terms of labor These elements imperatively command that the generally broad right to strike be enjoined or otherwise limited in such cases A strike by its employees which injuriously affects the essential functions of a hospital must therefore be held to be improper and inimical to public interest. No strike productive of such results can be permitted against a hospital which is supported by the public through voluntary contributions as well as through contributions made by the local government, and which is maintained for the benefit of the entire public, including those who cannot pay either in whole or in part the cost of their care and medical attention

It does not follow, however, that merely because the court will enjoin a strike it will also prohibit peaceful picketing Labor's right to picket has been developed by the courts following a strong tide of enlightened public opinion In the case at bar the picketing was entirely peaceful and was conducted without violence or misrepresentation. It did however, accompany a strike, the existence of which was well known to the members of other unions who would have to cross the picket line to deliver the hospital's necessary supplies and who would inherently be averse to do so while the strike was in effect Striking and picketing usually are concomitants in the public mind. Inasmuch, said the court, as peaceful picketing has consistently been held to be an exercise of the constitutional right of freedom of speech, we do not feel that defendants should, at this time at least be enjoined from picketing, provided however, that the picketing be done in such form as will not deter persons having business or professional relations with the hospital from crossing the picket line, and provided, further, that such picketing does not otherwise interfere with the hospital's functions

Accordingly the court ordered that a decree be submitted prohibiting strikes against the plaintiff but permitting peaceful picketing not interfering with the hospital's functions—*Society of New York Hospital v Hanson, 59 N Y S (2d) 91 (N Y, 1945) [interim injunction continued 60 N Y S (2d) 589 (N Y, 1945)]*

**Evidence Conflict of Opinion Between Experts and Consulting Physician**—For some time prior to Sept. 28, 1945 the claimant had been undergoing treatment for a retroverted uterus On that day she suffered an accidental injury in the course of her employment with the Wright Aeronautical Corporation. At a subsequent hearing of her claim for workmen's compensation her physician testified that the accident aggravated her prior condition Two physicians who testified as experts on behalf of her employer, however, said that there was no causal connection between her work and her condition on the 28th The court of common pleas of New Jersey said that, when there is contradictory medical testimony, it is reasonable to give greater weight to the consulting physician's testimony, especially where, as here, she was also the treating physician and knew the claimant's condition before the date of the accident. Accordingly the award of the Workmen's Compensation Bureau in favor of the claimant was affirmed.—*Schumacher v Wright Aeronautical Corporation, 45 A (2d) 447 (N J, 1946)*

**Mumps Convalescent Serum for Orchitis.**—An epidemic of mumps during the winter of 1945 in a specialized school of the Navy provided the material for this study by Rambar. From March 1 to July 1, 1945, 249 men were admitted to the hospital with mumps. Pooled serum was made from various groups of these patients, blood being drawn three to six weeks after recovery. Orchitis developed in 61 or 24.5 per cent, of the 249 men. In 86, to whom 40 cc. of mumps convalescent serum was given intravenously on admission, orchitis developed in 14, or 16.27 per cent. In 163 controls, orchitis developed in 47, or 28.83 per cent. These figures are significant. There was manifest encephalitis in 40 of the 249 patients, no difference being noted between the serum treated patients and the control groups. In 15 instances orchitis and encephalitis occurred together. Thus 86, or 35.3 per cent, of the 249 patients had orchitis, encephalitis or both. Convalescent serum and pooled plasma were used in the treatment of orchitis. Sixteen of the 26 treated patients had fever three days or less, the temperature of all of them dropping by crisis, as compared with a group of 30 control patients, in 10 of whom the fever lasted three days or less while the temperature dropped by crisis in only 7. Since the total number of days of fever in the treated group averaged 4.52 as compared with 5.4 in the controls, the value of serum or plasma as a therapeutic procedure cannot be definitely demonstrated.

**Rh Sensitization.**—Wiener and Sonn present 11 illustrative case histories in which sensitization to the Rh factor was the cause of congenital hemolytic disease. They stress that the Hr test is a valuable aid in determining the homozygosity or heterozygosity of type Rh. When the Hr test is negative, the person is homozygous (either genotype RhRh or genotype RhRh'), while if the Hr test is positive, he is almost surely heterozygous. If a man is homozygous for the Rh factor and his wife's serum contains Rh blocking antibodies, the prognosis for future pregnancies is virtually hopeless. In the presence of Rh sensitization, transfusions of plasma should be given instead of transfusions of blood unless Rh negative donors are available. Even a small intramuscular injection of Rh positive blood may be sufficient to sensitize an Rh negative woman. The injection of a potent antigen may prevent a person from becoming sensitized to a weaker antigen to which the person is exposed simultaneously. For example, the injection of typhoid or pertussis vaccine during pregnancy may be worth while in the case of Rh negative patients with sisters who have had erythroblastotic infants. Once sensitization has developed, however, counterimmunization does not affect the sensitization. That univalent antibodies (blockers) are more important than bivalent antibodies (agglutinins) in the pathogenesis of congenital hemolytic disease is proved by the ease with which the former can be demonstrated in the serum of erythroblastotic infants in the absence of agglutinins. This accounts for the lack of correlation between the isoagglutinin titer of the maternal serum and the severity of the hemolytic process in the infant. In the transfusion therapy of congenital hemolytic disease the washed red cells of the mother can be used because a newborn infant's serum never contains antibodies capable of reacting with the maternal red cells. A high hemoglobin concentration in an infant with hemolytic disease may mean that the disease process is mild, but frequently in such cases kernicterus or hemorrhagic manifestations develop and the infants die.

**Early Controlled Ambulation in Puerperium.**—Guerriero says that a system of early discharge of the puerperal patient from the third to the fifth day under controlled ambulation was instituted in 1940. There was a careful daily follow up in the homes by the nursing service of the Maternal and Child Health Division of the City Board of Health of New Orleans. The initial survey of 2,926 of these patients revealed the fact that only 30 developed immediate puerperal complications. These were in the nature of 2 patients with endometritis, 2 with mild pyelonephritis and 26 with engorgement of the breast and/or fissured or cracked nipples. Postpartum examination of these patients at six weeks revealed that the general recovery rate was better in comparison with patients who remained nonambulatory in the hospital. Relaxations and/or uterine prolapse, malpositions of the uterus and subinvolution of the uterus were present in a smaller number than in nonambulatory patients. A further detailed study of 323 private patients was undertaken in order to assay the advantages or disadvantages in a class of patients usually seen in private practice. The author concludes that early controlled ambulation offers advantages to the obstetric patient without imposing disadvantages.

**Heartburn of Pregnancy**—Normally the emptying time of the stomach is about two hours, whereas in pregnancy this time may be doubled. Twenty pregnant women complaining of heartburn were given a supply of neostigmine bromide tablets (15 mg. each) and instructed to take one as soon as the symptom appeared. Fifteen of the 20 patients reported complete relief within fifteen minutes after taking one tablet. If the symptom recurred (as it often did each day) another tablet of neostigmine bromide gave similar prompt relief. Two patients reported partial relief; 2 obtained no benefit at all and in 1 case the results were inconclusive.

**Fat Embolism**—Warren reviewed 100 consecutive cases of fat embolism from the files of the Army Institute of Pathology. Ninety one cases were due to trauma with fracture of one or more bones, 4 cases were due to blast injury without fracture, 3 to burns and 1 each to pressure asphyxia without fracture and to trauma from shell fragments. Fat embolism produced instant death (peracute form) in 9, death following symptoms of immediate origin (acute form) in 17 or death following symptoms developing after a free period (subacute form) in 58 cases. The occurrence of fat embolism is apparently independent of the nutritional state. A free period in which the patient may be apprehensive may precede the development of symptoms. Fat embolism may be recognized clinically by the development of pulmonary or cerebral symptoms following (*a*) a fracture or extensive injury of soft parts or (*b*) manipulation of a fracture. After some time, lipuria or fat droplets in the sputum may aid in establishing the diagnosis. Although renal fat embolism may be severe, renal failure is not a cause of death. Fat embolism may be missed as a cause of death unless it is searched for consistently. In necropsy material the presence of fat may be checked by watching for vacuoles in the glomerular tufts or in the lung parenchyma in routine sections. Therapy is usually unavailing and is best directed toward the prevention of anoxia.

**Hydrogen Sulfide Poisoning**—Freireich reports 2 cases of hydrogen sulfide poisoning, 1 with fatal outcome, as a result of cleaning a cesspool to which concentrated sulfuric acid had been added. The author urges that health agencies and the public should be warned of the dangers of such procedures.

**Pulmonary Changes in Carbon Tetrachloride Poisoning**—Thompson treated 20 patients for carbon tetrachloride poisoning occurring on a submarine. Four were severely ill presenting a typical toxic nephrotic syndrome evidenced by puffiness and swelling of the soft tissues of the face, hands and feet. They had retention of nitrogenous waste products in the blood stream and evidence of kidney damage. One of the 4 patients died. The clinical course in each case and the necropsy observations in the fatal case were consistent with those described in the literature. Pulmonary roentgenographic changes were discovered late in the course of the disease. The changes varied from consolidation of all five lobes to mild increase in all lung markings. In 1 case there was a change in the configuration of the cardiac silhouette between examinations. Only the fatal case manifested symptoms and physical manifestations of organic change in the lung fields. In the other 3 cases the predominating symptoms were gastrointestinal followed by renal failure. The amount of change on the roentgenograms of the chest was directly proportional to the severity of the clinical illness. Perhaps pulmonary x-ray changes may be used as criteria in the prognosis and morbidity of cases of carbon tetrachloride poisoning.

*Use of Blood-Kaolin-Penicillin Paste in Treatment of Varicose and Torpid Leg Ulcers. E. J. Orbach.—p. 253

**Blood-Kaolin-Penicillin Paste for Leg Ulcers**—Considering the requirement of ambulatory treatment of varicose ulcers, Orbach adopted a simple and time saving method whereby the patient's blood, or group O from a blood bank, if available, was mixed with equal parts of kaolin. To this mixture 0.5 cc. of penicillin standard solution (5 000 units per cubic centimeter) was added to 10 cc. of paste. The paste was applied to the ulcer and covered with a sheet of gauze. A thick layer of talcum powder was spread over the gauze and the entire leg was encased in an Unna's paste boot or an elastoplast bandage. The bandage was changed every five to eight days and the patient was kept ambulatory if possible. The author used this method in 19 cases of varicose and trophic leg ulcers with and without chronic eczema. In 2 cases the paste failed to effect a cure. Superficial and deep ulcerations were benefited by the blood paste, whereas chronic varicose eczema became aggravated. Stimulation of granulations, promotion of epithelization, reduction of infection and a pain relieving effect on irritable ulcers were evident. The paste may be considered

to be a valuable adjunct in the treatment of varicose ulcers It seems to exert a nutritional and protective effect on the ulcerations In the therapy, however, the reduction of the venous backflow by ligation, sclerotherapy and supportive bandages must not be neglected

**Congenital Cystic Dilatation of Common Bile Duct**—In both cases of congenital cystic dilatation of the common bile duct observed by Shallow and his associates the lesion was suspected before the operation The diagnostic triad tumor, jaundice and pain was present in 1 case, but pain was absent in the other The 5,800 cc. of cyst fluid observed in the second case represents the largest amount recorded in an undisputed case. The safest treatment, and the one recommended for general employment, is primary anastomosis of the cyst to the duodenum This procedure was successfully performed in case 2 Extirpation of the cyst followed by primary anastomosis of the remainder of the biliary duct system to the duodenum may be attempted if the lesion is suspected preoperatively, the patient a good operative risk, the cyst large, and infection minimal or absent. The feasibility of this procedure is demonstrated in the first patient, who is entirely well three years and eight months postoperatively

*Adrenal Glands in Pemphigus Vulgaris Report of Case J W Goldzieher—p 42

**Formaldehyde and Cupric Sulfate Iontophoresis**—Freis employed the method of formaldehyde iontophoresis in the treatment of 85 patients with epidermophytosis of all grades of severity The therapeutic response in patients whose disease was of moderate severity was prompt and effective The solution proved to be too caustic to be used in severe infections with denuded surfaces Fourteen patients with uncomplicated hyperhidrosis were treated with three daily treatments of solution of formaldehyde by iontophoresis with resulting complete remission of symptoms for approximately one month Thirty five patients with dermatophytosis were treated with cupric sulfate solution by iontophoresis The therapeutic response was good in cases in which the severity of the disease was moderate, but more treatments were required to effect a remission than with the use of formaldehyde. Cupric sulfate was well tolerated in cases of acute severe lesions exhibiting denuded surfaces The results of treatment were good. Iontophoresis was successful in the treatment of severe chronic phytid reactions when other methods of therapy had failed Treatment should be applied to the phytid lesions as well as to the feet Serious toxic reactions were not encountered Judicious use of formaldehyde and cupric sulfate iontophoresis produces a prompt clinical remission of dermatophytosis in 75 per cent of cases

**The Adrenals in Pemphigus Vulgaris**—A woman aged 34 who had pemphigus vulgaris showed good response during a period of therapy with adrenal cortex extract but died after the treatment was discontinued Necropsy revealed a congenital malformation of the left adrenal gland and extensive destruction of the right gland The pathologic process was similar to that described in a previous publication Goldzieher assumes that there was congenital malformation of the left adrenal gland, which was represented only by some scattered nodules of cortical tissue which were highly inadequate from the functional point of view On the right side the major portion of the gland had been destroyed by a thrombosis of not too recent date. The peripheral tissue showed both acute and chronic degenerative changes with fibrosis and some evidence of nodular regeneration Judging from the histologic picture there was really no functional cortex left, the medulla had been entirely destroyed

**Histopathologic Effect of Anoxia on Central Nervous System.**—Morrison exposed 25 dogs daily to atmospheres of low oxygen concentration at the pressure of sea level and 10 monkeys were similarly exposed in a decompression chamber

The oxygen content of the arterial blood was measured in the dogs Microscopic studies were made on the central nervous systems of all the animals and on the adrenal glands of the dogs The degree and duration of anoxia were important. It was found that a single sudden exposure to a simulated altitude of 32,000 feet (10,000 meters) for twenty-five minutes was capable of producing extensive laminar necrosis in the cortex of the monkey With repeated exposures to mild hypoxia it was observed that the first histologic changes occurred in the cell bodies of the cortical gray matter This took place at a level of about 12 or 13 volumes per cent of oxygen in the blood if the exposures were long enough and were repeated often enough. When the proportion of oxygen was reduced still lower to about 10 volumes per cent, and the number of exposures was increased, the white matter also became involved and presented a pattern of demyelination in the corpus callosum, the centrum semiovale and the adjacent fibers of subcortical white matter, which, in the cases of more severe anoxia, suggested a resemblance to Schilder's disease Aside from the lesion of the white matter frank necrosis was usually found to occur only after episodes of anoxia sufficiently severe to produce cessation of respiration The frontal lobe was not often involved and the temporal lobe least often. The cerebellum was more frequently affected than the basal ganglions, and the spinal cord and medulla were unaffected by any degree of anoxia compatible with life. An oxygen level of 4 or 4 5 volumes per cent was about as low as a dog could tolerate. Respirations quickly ceased below that level. The adrenal glands showed increased cortical activity

**Lempert's Fenestra Nov-Ovalis Operation in Otosclerosis** —Greenfield reports the results of the Lempert fenestra nov-ovalis operation in 36 selected cases The author concludes that this operation is the only form of treatment for the restoration of hearing in patients with otosclerosis The patients most suitable for operation are those with the purely conductive type of deafness without evidence of nerve involvement.

**Bronchoscopy in Diagnosis of Allergic Pulmonary Disease** —In a bronchoscopic study of 176 children with symptoms of asthma Lell found that 18 had foreign bodies in the respiratory tract, 5 had such objects in the esophagus and 23 had other organic changes The majority of the patients in status asthmaticus who were observed bronchoscopically showed a hemorrhagic and edematous appearance of the mucous membrane of the trachea and both main bronchi with the presence of thick, tenacious secretion In addition most of the patients showed collapse of the posterior tracheobronchial wall Both gross and microscopic studies of the respiratory tracts of 5 patients who died in status asthmaticus confirmed these findings The author states that bronchoscopic aspiration of the pulmonary secretion of patients in status asthmaticus who do not respond to medical treatment may often be a life saving measure The results in 102 patients treated bronchoscopically are tabulated. Oxygen administered through the bronchoscope during the aspiration relieves the dyspnea

**Intravenous Administration of Oxygen in Shock** —Jacobi and his associates studied the effects of intravenously administered 100 per cent (commercial and U S P) oxygen in 12 dogs with experimentally induced toxic shock and in 3 human beings with severe acute progressive (secondary traumatic) shock No symptoms of vapor lock (cardiac tamponade), gas embolization or other deleterious effect developed clinically, and no evidence of embolization or vapor lock was noted at necropsy in the animals All 3 human beings recovered rapidly from shock The earliest evidences of improvement consisted in the return of normal color to mucous membranes and an increasing bright pink-red color to the blood followed by an elevation in blood pressure and diminution in respiratory rate. The concentration of blood cells and the specific gravity of the capillary blood, both previously extremely elevated, fell rapidly toward normal Gaseous oxygen intravenously administered at pressures at or slightly above venous pressure and at rates of 60 to 600 cc. per hour depending on the size and the age of the person, can be given with safety in the treatment of secondary shock. It may be efficacious when oxygen by inhalation fails, since by the intravenous route a functionally deficient lung can be by-passed and the necessary oxygen made available to the body

**Experimental Anaphylactic Pulmonary Lesions** —Gregory and Rich studied sections from the lungs of 56 rabbits subjected to the serum sickness type of hypersensitive reaction In 10 of the animals there occurred small focal lesions characterized by damage to the alveolar capillaries (thrombosis exudation of fluid and cells hemorrhage) which, in their basic nature resemble the lesions of rheumatic pneumonitis This experimental evidence is offered as further support of the view that the various lesions of rheumatic fever are the results of hypersensitivity

**Radioactive Phosphorus in Blood Dyscrasias and Neoplastic Diseases**—Reinhard and his associates present the results obtained in 155 patients treated at the Mallinckrodt Institute of Radiology. The half-life of $P^{32}$ (14.3 days) permits steady radiation of tissues for several weeks yet is short enough so that the destructive effect on tissues can be controlled. The authors think that radioactive phosphorus is probably the best therapeutic agent for polycythemia vera. In the great majority of patients, the clinical course of acute lymphatic leukemia is not favorably influenced by $P^{32}$ therapy. In a few patients clinical improvement has been observed. Spontaneous remissions of acute lymphatic leukemia have been observed. In the treatment of chronic lymphatic leukemia, $P^{32}$ is probably as satisfactory as, but no better than, roentgen radiation. Radioactive phosphorus is of no value in the treatment of monocytic leukemia. Hodgkin's disease, lymphosarcoma, reticulum cell sarcoma and multiple myeloma do not respond as favorably to $P^{32}$ as they do to x-radiation. From observations on the few patients who have been treated there is no reason to believe that $P^{32}$ is a satisfactory therapeutic agent for the treatment of lymphoepithelioma, malignant melanoma, carcinoma of the gallbladder, carcinoma of the breast, Ewing's tumor, mycosis fungoides or xanthomatosis. $P^{32}$ has been shown to have a profound effect on the bone marrow. Severe leukopenia, thrombocytopenia and anemia may occur as complications of the therapy. In patients with any type of chronic leukemia, roentgen radiation is more effective in some cases than $P^{32}$ in bringing about a rapid reduction in the size of the spleen or lymph nodes. Therefore x-rays should be employed whenever the prompt reduction of nodes or the spleen is necessary to relieve symptoms or remove pressure on some vital organ. X-rays may be used to supplement radioactive phosphorus therapy for this purpose.

Use of Curare in Treatment of Spastic Paralysis. D. F. James and S. Braden—p. 74

**Curare in Spastic Paralysis**—James and Braden used curare in the treatment of spasms of the lower extremities of 12 young men with paraplegia secondary to transverse myelitis incurred as the result of wounds. The drug was administered intramuscularly. The patients were given initial doses of between 0.020 and 0.100 Gm. repeated not oftener than every seventy-two hours. The revised schedules stipulated doses varying from 0.050 to 0.070 Gm. given at six hour intervals. Mild toxic reactions were seen when doses exceeding 0.080 to 0.100 Gm. were employed. When smaller but therapeutically effective doses were used, mild toxic reactions were observed in approximately 50 per cent of the cases. The mild toxic reactions consisted in weakness in ocular convergence, droopiness of the lids and at times generalized muscular weakness. No cumulative effect was noted when the drug was administered four, and in 1 case five times daily over a period of more than a month. When curare is being employed for the purpose of facilitating the use of a walker or braces, it has been found best to administer the drug one hour before the patient begins this exercise. Spasticity was diminished to a noticeable degree in all patients for from one to two or more hours after every administration of an effective dose. Spasticity returned gradually to its original severity in from four to

seven hours following injection The use of curare has been helpful in the management of patients with bed sores, as an aid in physical therapy and in diminishing the number of spasms Relief of pain was coincidental with the alleviation of the spasms effected by curare

**Lipemic Nephrosis**—Heymann and Startzman studied 34 children with primary lipemic nephrosis About two thirds were under 3 years of age at the onset, and most of the others were less than 7 years old, that is, the incidence decreases with age In 6 postmortem examinations 3 showed no signs of inflammatory disease, and azocarmine stains revealed normal, not thickened, glomerular basement membranes In the 3 remaining cases renal inflammatory disease was found in addition to nephrotic changes the nephritis being interstitial and pyelonephritic in type. The endogenous origin of the hyperlipemia of nephrosis is shown by the fact that it is not affected by diets of either low or high fat ratios, nor does the nephrotic hyperlipemia decrease when 30 to 40 Gm of soya bean lecithin is given for four weeks The authors recommend a salt free diet containing 3 Gm of protein per kilogram of body weight and a fluid intake limited to 1,200 to 1,500 cc in combination with thyroid This is increased every ten days by ½ grain (32 mg) As soon as toxic symptoms are observed, the dose is reduced by ¼ to ½ grain (16 to 32 mg) and kept as a maintenance dose for two to three months

**Intradermal Test for Vitamin C Deficiency**—Slobody and his associates describe an intradermal test to indicate vitamin C subnutrition states qualitatively, based on the intradermal injection of a dye which will be decolorized by vitamin C Slow decolorization of the dye indicates that the tissues have an insufficient amount of vitamin C Rapid decolorization indicates a sufficient amount Enough of a three hundredth normal solution of sodium 2 6-dichlorphenol indophenol is injected to raise an approximately 4 mm wheal A skin test time (the length of time required for the dye to disappear) of fourteen minutes or more suggests a definite degree of tissue unsaturation, from ten to thirteen minutes is borderline and less than nine minutes indicates a normal amount of vitamin C in the body tissues Vitamin C subnutrition was induced in 16 children by a diet which lacked citrus fruits and tomatoes The plasma ascorbic acid levels and intradermal test followed reliably the induction of vitamin C deficiency and returned to normal with administration of ascorbic acid The intradermal test is cheap easy to perform and quickly read

**Toxoplasmosis**—Adams and his co-workers studied a typical case of toxoplasmosis in a 14 year old girl who was a member of a large Minnesota family The patient had 10 living siblings and 5 other close relatives Complete physical studies, including funduscopic examinations, were made on 11 members of the family Neutralization tests against the toxoplasma organism were done on blood serum from these and 4 other members of the family group Positive neutralization tests against the toxoplasma organism were present in the patient, her mother and 8 of 9 siblings tested The mother and the 9 siblings had no clinical symptoms or signs of toxoplasmosis as determined by physical and roentgenologic examination Whether infection in this patient and her siblings was congenital or acquired could not be ascertained

**Tick Borne Epidemic of Tularemia**—Warring and Ruffin report an epidemic of 50 cases of tularemia which occurred among soldiers in the Tennessee maneuver area in 1943 All patients but 1 recovered A history of tick bite prior to onset of illness was obtained in 32 of the 50 cases Five appeared to be due to direct contact with rabbits The onset of symptoms in the cases of tick bite occurred within one to twenty-one days The most prominent symptoms were generalized aching, especially in the lumbosacral region and the lower extremities, headache shaking chills, debilitating sweats pain and tenderness in the regional lymph nodes unproductive cough, weakness, dizziness, nausea, vomiting anorexia and abdominal pain At the site of infection or bite were punched out ulcers The primary ulcers were found on the upper and lower extremities, perineum buttocks the lower part of the abdomen and the scapular region Enlarged regional lymph nodes were found in every case with an obvious primary lesion and in 3 without one In the early stages of the disease fever was continuous varying between 101 and 105 F Later there were morning remissions and in the majority of cases the fever fell by lysis to normal in the fourth week of the disease Convalescence was slow Weakness lassitude and loss of weight persisted Most of the patients have been in the hospital for three to six months Treatment was nonspecific and supportive Oxygen was given early to patients with pneumonia it seemed to offer the best chance for recovery Wet dressings and bland

ointments were applied to ulcerated lesions When softening of regional nodes occurred, surgical incision and drainage were instituted Thoracentesis for pleural effusion caused an amelioration of symptoms

**Penicillin in Bronchiectasis**—Bobrowitz and his associates compared the value of various methods of administering penicillin in the treatment of bronchiectasis—intramuscular, intratracheal, intrabronchial, inhalation (nebulization) and combinations of these methods The advantages of the topical or bronchial effect were studied Ten men and 2 women were treated The total dosage of penicillin varied from 550,000 to over 5,500,000 units and the length of treatment from four to one hundred and fifteen days The concentration of penicillin in the sputum was highest with intratracheal administration, less with inhalation and lowest with intramuscular injection The most rapid results were achieved with intratracheal instillations The simplest method of administration is inhalation The sputum was considerably diminished and its odor was removed, most organisms were eliminated and purulence was reduced Considerable symptomatic improvement occurred These changes were maintained while the penicillin was continued but did not persist long when it was stopped As symptomatic therapy for nonoperative cases and possibly for the control of bronchiectasis, penicillin will be required over a long period and perhaps indefinitely Penicillin given intratracheally and by inhalation is also suggested as a form of preoperative preparation for lung resection for bronchiectasis

**Radiation Sickness in Nagasaki**—Timmes says that when the atomic bomb exploded the concentrated energy diffused itself in three main channels pressure, heat and radiation. The effects of the atomic bomb differ from the ordinary explosive bomb only in its release of radiant energy The atomic bomb dropped on Nagasaki was exploded at an estimated altitude of 800 feet. At this height much of the radiant energy was expended into the atmosphere with the probably anticipated result that the underlying terrain would not remain radioactive for a prolonged period. In contrast, the New Mexico test bomb, exploding only 100 feet above the ground, caused the earth in the surrounding area to contain radioactive materials for months after the explosion. X-ray film buried in the Nagasaki bombed area and attached to various objects failed to reveal the presence of radioactive elements Investigators with Geiger point counters found only negligible amounts of radiation X-ray films attached to the limbs of atomic victims and kept in place for eighteen hours failed to reveal radiation The patients examined showed true forms of radiation sickness Only a few cases which could be classified as x-ray skin burns were noted. Many cases of alopecia were seen Some of these victims began to lose their hair four or five days after the explosion, while others first noted this phenomenon about the third week None of the persons exhibited complete loss of hair At the end of a month a few had already begun to grow new hair of a downy nature. The principal effect of the radiation was on the bone marrow, with a considerable degree of depression of the marrow function. Most of the cases seen showed an aplastic type of anemia The blood was deficient in red blood cells and hemoglobin. As granulopoiesis was greatly impaired, agranulocytosis resulted A white blood cell count under 1,000 offered a poor prognosis, however, 1 person with 400 cells per cubic millimeter recovered. Petechiae were commonly seen, as were gross hemorrhages. Bleeding times were increased. The oral changes consisted in a glossy, smooth tongue, with ulcerative lesions of the mucous membranes Liver extract seemed to benefit a few patients but in general was not very effective. Pentnucleotide was used in limited amounts in 7 cases, and in each 1 a progressive rise of the white blood cell count appeared

**Electric Ophthalmia**—Woodward observed 47 cases of flash burn of the eyes, or electric ophthalmia, on a repair ship The greater number of cases were contracted by men working in the immediate vicinity of the welders, and all these men had momentarily removed their goggles at the time an arc was struck or did not use goggles while at work. The symptoms were principally a mild to severe injection of the conjunctiva, and more especially an episcleral injection In 5 instances there was considerable edema of the eyelids In 6 men there was evidence of pseudopterygium with accompanying injection Superficial ulceration of the cornea was present in 2 cases Treatment consisted in irrigation of the eye with mild boric acid solution and instillation of a solution containing pontocaine hydrochloride and neosynephrin hydrochloride. In many instances an ointment containing 2 per cent butyn sulfate also was employed Relief was obtained, especially when there was edema of the lids, by application of cool boric acid compresses The response to therapy was prompt About one third of the patients were removed from duty for a twenty-four hour period

**Intrathecal Penicillin in Pneumococcic Meningitis**—Jepson and Whitty report the results of treatment of 10 cases of pneumococcic meningitis with intrathecal penicillin In 9 cases the meningitis followed head injury Treatment included sufficient sulfadiazine to maintain a cerebrospinal fluid concentration of 8 to 14 mg per hundred cubic centimeters Fifteen thousand units of penicillin was given intramuscularly every three hours for possible extrameningeal sources of pneumococcic infection Direct intrathecal injections were made every twenty-four hours since previous observations had shown that 5,000 to 10,000 units of penicillin in the cerebrospinal fluid inhibited a standard organism up to twenty four hours When the clinical state was very grave, lumbar puncture was done more frequently Lumbar and ventricular routes were used and dosage varied from 5,000 to 50,000 units per dose Five patients recovered 4 died and 1 recovered from meningitis but died of other causes The importance of starting treatment early is emphasized Observations made on the cerebrospinal fluid reactions to penicillin suggest that the pronounced pleocytosis often seen is due to factors other than penicillin itself The cerebrospinal fluid cell count is not always reliable as the chief index for further treatment

**Endemic Fluorosis in Kweichow, China**—A high incidence of mottled enamel and spondylitis has been reported in Kweichow The drinking water in these regions contains approximately 6 parts per million of fluorine. The drinking water frequently comes from coal mines or sources near to the mines Lyth reports a study of 4 cases of spondylitis occurring in this area and the skeletal findings in 1 case in which death occurred after a trivial fall Of 134 persons examined, dental fluorosis was observed in 97

**Genital Tuberculosis as Main Cause of Tubal Occlusion.**—Halbrecht found that of 150 sterile women examined by salpingography at the Sterility Clinic in Tel Aviv 48 had partial or complete tubal occlusion Biopsy revealed tuberculosis of the endometrium in 18 This suggests that one of the main causes of tubal occlusion may be pelvic tuberculosis

Occupational Therapy in Leprosy Institutions D Dow—p 57
*Modes of Transmission of Hansen's Disease (Leprosy) B Moiser—p 63
Palm Oil in Leprosy L. Lengauer—p 67

**Transmission of Leprosy**—Moiser reports studies of cockroaches collected in the vicinity of the Ngomahuru Hospital, Southern Rhodesia Sixty nine per cent examined showed small acid-fast "oval bodies ranging from the size of a red blood corpuscle to that of a small bacillus such as Hansen's Most of the oval bodies were opaque and stained very deeply with carbolfuchsin, but occasionally a ruptured one was found the contents of which were either granular or bacillary and indistinguishable from Hansen's bacillus Oval bodies were not found in bedbugs, ticks or flies Hansen's bacilli were found in large numbers in the dried feces of cockroaches fed a meal to which had been added material from ulcerating nodules In some the bacilli were so numerous as to suggest multiplication in the intestine. Bacilli were found to remain unchanged in the dried roach's droppings for 169 days Scars of roach bites also were found to contain bacilli of Hansen Of 230 roaches caught in various native patients' huts and not fed specially on leprous material 55 were found positive for Hansen's bacilli The author concludes that further investigations on cockroaches may produce evidence that the disease is occasionally transmitted by the bite of the roach and possibly by its dried feces coming into contact with the skin or being ingested with food

Fluorographic Examination as Base of Prophylaxis of Tuberculosis M de Abreu—p 377
*Interesting Case of Acute Silicosis Bagassosis M A Mañas—p 391

**Acute Silicosis Bagassosis**—Mañas discusses observations on mining engineers who were doing geologic work in a region which was only 4 kilometers from an active volcano Eruptions from this volcano caused the atmosphere to be so densely charged with dust that vision beyond a few meters was impossible After about four months the men began to notice respiratory symptoms in the form of a dry, spasmodic cough There was disseminated erythema over the thorax and abdomen, and at the same time there existed intense pallor of the face One of the men developed what appeared to be an influenzal attack with fever, headaches, muscular aches, general malaise and furred tongue. Roentgenoscopy of the lung revealed infiltrations of small or larger foci Subsequent roentgenograms showed the same or a more severe picture of infiltration The patient died in severe dyspnea with cyanosis and cardiac insufficiency The author thinks that this was a case of acute silicosis The author is also concerned with a form of pneumonoconiosis that occurs in the utilization of the bagasse of sugar cane. The bagasse is used either for fuel or for the manufacture of a fiber board for insulation For the fabrication of this board the bagasse is cut up and in this process much dust is produced Workers who are exposed to the dust develop symptoms of bagassosis in from two to four months Violent attacks of coughing continue for several days and there is severe dyspnea. The mucous sputum is frequently tinged with blood The cough and dyspnea are accompanied with retrosternal pain Debility may persist for months Roentgenologic examination of the lungs reveals signs that are characteristic of the first phase of silicosis The pathologic process in the lungs may disappear so that the normal state is restored or it may progress to a typical fibrous lesion It is suggested that the bagasse contains an allergen which may produce sensitization The acute phase of bagassosis is possibly an allergic response of the lungs to this allergen The second phase may be the response of the lung to the crystalline cellulose that is contained in the bagasse The third stage is a fibrous process

Clinical and Pathologic Findings in Myelomatosis and Plasma Cell Leukemia J Bpe—p 101

**Chromaffin Tumor Simulating Toxic Diffuse Goiter**—Waaler reports a case of chromaffin tumor in a man aged 49 The patient developed palpitation excessive sweating and nervousness The symptoms occurred in bouts lasting from two

to three hours There was high blood pressure and increased basal metabolism The urine contained albumin, casts and erythrocytes, the clearance was diminished A diagnosis of toxic diffuse goiter with nephritis was made and subtotal thyroidectomy was performed Palpitation of the heart and excessive sweating recurred some time after the operation The disease lasted three and a half years, when the patient died with signs of a subarachnoid hemorrhage The postmortem revealed a pheochromocytoma originating in the right semilunar ganglion Thirty five mg of epinephrine was found in this tumor, but the examination was carried out thirty hours after death and it may be assumed that the original amount had been much higher Patients with chromaffin tumors are sympathicotonic, and one must expect an increased basal metabolism due to hypersecretion of epinephrine There may be oscillations in the basal metabolism corresponding with the variations in the other manifestations This case presented the signs and symptoms of toxic diffuse goiter and of Jabbes syndrome parabasedowien," and this explains to some extent the mistaken diagnosis

**New Flat Epithelial Layer Covering Gastric and Intestinal Mucosa**—Duran Jorda studied the mucosa of the stomach, intestine, appendix colon, gallbladder and rectum in specimens received from the operating room The material was submitted to a process of slow fixation by drying, in an atmosphere saturated with formaldehyde vapor On microscopic examination a flat epithelial layer was revealed at the top of the gastric and intestinal mucosae This layer is very fragile and disappears if roughly handled or if fixed in formaldehyde saline solution It also disappears from postmortem specimens The layer is formed by flat epithelial cells and contains a large quantity of diapedesic cells and a network of capillaries The layer varied in thickness from the width of one cell of 3 microns to about 75 5 microns The size of its capillaries varied from a diameter of one red blood corpuscle up to 630 by 378 microns In the appendix large fecaliths were included in the flat epithelial layer The existence of this layer was demonstrated in the human fetal gastric mucosa and in the mucosae of different mammals It is suggested that this new layer may protect the mucosa from autodigestion by gastric and intestinal enzymes The presence of this layer aids in the interpretation of microscopic findings in cases of preulcerative processes in the stomach, of the healing process of gastric ulcer and of postulcerative processes The problem of the bleeding, mucosa without any apparent ulcer present can be explained after seeing the large capillaries included in the flat epithelial layer, and the possibility of a profuse hemorrhage with only microscopic lesions can be fully appreciated

**New Therapy for Crush Injury**—By means of an artificial nephron constructed of glass and rubber tubes and connected with two mercury manometers and several clamps Peters imitated the mechanical filtration process which is a part of the kidney function He thus demonstrated that the effect of imitating an anuria without any obstruction is exclusively the result of an increased intrarenal pressure causing a decrease of the effective filtration pressure The common denominator in mercury poisoning, crush injury, transfusion kidney and other diseases, e g sulfonamide poisoning, Weil's disease and acute and chronic nephritis, appears to be a syndrome consisting of oliguria and anuria caused by an increased intrarenal pressure and associated with hyperazotemia and uremia In cases with low blood pressure pressor drugs are recommended since experiments with the artificial nephron showed that an increase of pressure in the afferent arteriole supported the effect of a slight decrease in the intrarenal pressure In addition certain diuretics are recommended which are supposed to extract fluid from the renal interstices As an important part of the therapy, decapsulation of the kidney is recommended as an emergency operation on the first day in which the syndrome develops An increasing blood urea nitrogen during oliguria or anuria is the danger sign Uremia caused by glomerular destruction should be sharply differentiated from the form amenable to treatment and associated with the syndrome discussed, 'pressure uremia' is part of the syndrome while 'glomerular uremia' cannot be cured by lowering the intrarenal pressure

### Hygiea

Histologically Specific Skin Reaction in Benign Lymphogranulomatosis Produced by Dead Tubercle Bacilli I E. Warfvinge—p 1493

**Influenzal Meningitis**—Jacobsson reports that of 17 patients with influenzal meningitis treated with sulfonamides 8 recovered, the fatalities occurred in patients under 15 months of age Experience confirms the necessity of high dosage Sulfapyridinine is recommended because it is eliminated more slowly than sulfathiazole and thus gives a constant and higher concentration than the same dosage of sulfathiazole especially in the cerebrospinal fluid, and because secondary toxic effects are considerably reduced The sulfonamide medication should be continued till the cell count in the cerebrospinal fluid and the white blood cell count are normal and the sedimentation rate shows a tendency to drop to normal values Examination of the blood and spinal fluid of those who died and those who recovered showed consistently higher concentration in the latter group Of the 12 patients with pneumococcic meningitis treated with different sulfonamides only 2, aged respectively 2 and 14 months recovered, the second one only after long and intensive therapy with sulfapyridinine

**Intercapillary Diabetic Glomerulosclerosis**—Hilden says that, while reports of approximately 50 cases of this disorder have been published only 11 including a personal case, have been fully described Intercapillary diabetic glomerulosclerosis occurs in older persons, apparently more often in women, and is characterized by a mild diabetes mellitus, grave proteinuria hypertension and edema of the nephrotic type Ascites and hydrothorax may be present Usually there is enlargement of the left half of the heart with functional dyspnea Ophthalmoscopy reveals hypertensive retinopathy The characteristic anatomic pathologic changes consist of hyaline deposits in the central portions of the glomeruli, where the capillaries have degenerated Nearly all the glomeruli are affected Hyaline changes are often found in the vas afferens The relation between urea and diodrast clearance points to this disorder as a distinct syndrome

**Chemotherapeutic Treatment of Acute Suppurative Pansinusitis**—In Burhöj's 43 cases, 10 unilateral, 33 bilateral treatment with sulfonamides resulted in relatively rapid recovery

# Book Notices

**Pathology in Surgery** By N Chandler Foot M D Professor of Surgical Pathology Cornell University Medical College New York Fabrikoid Price $10 Pp 511 with 388 illustrations Philadelphia London & Montreal J B Lippincott Company 1945

This is a new publication and represents a distinctly progressive step The author justifiably designates surgical pathology as a subspecialty The book is modeled after Karsner's Pathology, which in itself indicates that a special teaching approach to the subject is necessary The difference between general pathology and this specialty is briefly considered in the first page of the book Essentially the surgeon and his associate the pathologist are concerned with the future rather than that which has preceded Often a diagnosis is demanded of the surgical pathologist which has important bearing on the future well being of the patient This demands prompt accurate judgment while the patient is yet in the operating room, a responsibility not lightly dismissed

The volume is divided into a number of sections, including technics and general discussion The various tissue systems and organic structures are then discussed in orderly fashion The material included is intended primarily for basic introduction to the field. While most of it is found in any good textbook of pathology, its value lies in the arrangement and attitude to the subject There are many illustrations, which are uniformly excellent At all times the descriptive text is clear and well presented. There is a tendency to cling to former morphologic descriptions which have proved of less value to the surgeon than is generally supposed This is especially true in certain cancers, it must be added that classification has been considerably simplified however, and questions which may be posed by surgeons are answered as far as the scope of the book permits Students and trainees in surgery and surgical pathology will benefit from this work.

**Risk Appraisal** By Harry Dingman Vice President and Medical Director Continental Assurance Company Fabrikoid Price $10 Pp 824 with illustrations Cincinnati National Underwriter Company 1946

This book has been prepared by a well known authority in the field of insurance medicine Its title could well have been 'The Textbook of Prognostic Medicine," for the author tells what happens to the patients who are seen every day His emphasis is not on longevity but on mortality not how long patients live but how often they die What he means, of course, is whether any group of a thousand persons with some specific ailment will have the usual ten deaths per year at some certain period in middle life or will have twenty If twenty mortality prospects are said to be 200 per cent. Insurance literature is cited freely, has an immense reservoir of information of what happens to 10 000 or even 100 000 persons who have definite impairments for example attacks of renal colic, blood pressure readings of 145/95, or weight that exceeds the average by 10 20 or 30 per cent His treatment of circulatory, renal and gastrointestinal impairments is of especial interest in that he presents all the facts on which a long range prognosis may be based. The book is well written and stimulating Material is well arranged and presented It may be considered an authoritative work on prognostic medicine from the point of view of insurance physicians

**Acquisitions médicales récentes dans les pays alliés** Par A Abaza Paper Price 1 000 francs Pp 706 with 9 illustrations Paris G Doin & Cie 1946

The author undertakes in this book to offer, presumably to French readers, a condensed account of the Anglo American medical literature of the years 1940 to 1945 The volume deals with the discovery of penicillin and its uses with the various sulfonamide derivatives and with the newer therapeutic measures employed in the treatment of malnutrition and endocrine diseases The volume will probably serve a useful purpose in filling the gap for the general practitioner in certain European countries which were deprived of access to our literature The information contained in the volume has been conscientiously gathered and is well presented

**The Symptomatic Diagnosis and Treatment of Gynecological Disorders.** By Margaret Moore White M D F R C S M R C O G With a foreword by F J Browne M D D Sc F R C S The General Practice Series Second edition Fabrikoid Price 16s Pp 246 with 103 illustrations. London H K Lewis & Co Ltd 1946

This book is developed on the principle of ready reference for office gynecologic therapy Its style adheres to the headings of symptoms, following which there is classification of disease in relation to the symptom complex and clinical findings The author in several places refers to the medical monilia which causes vulvar and vaginal mycosis as a yeast. This is distinctly an error, for yeasts are nonpathogenic or friendly fungi, with their use dominantly in bakeries, breweries and the like In chapter II, on pruritus vulvae, it is stated that the pruritus is the result of diabetes Recent investigations have shown that glycosuria per se does not cause irritation. It is the medical monilia present which causes a mycosis under these circumstances On page 17 fungous infections are classed as protozoal The fungi belong in the holozoic group Trichomonads are in the protozoic list The discussion of amenorrhea is thorough, and almost as good a presentation of dysmenorrhea is present. In the section on menorrhagia and irregular bleeding, one might get the impression that too much emphasis is placed on medical management The diagrams in the section on vaginal and uterine prolapse are good The author deserves special commendation for the appropriate but not exclusive use of vaginal pessaries The space given to uterine suspension operations is not consistent for office practice or in complete accord with the views of many gynecologists The section on sterility is good, but there is inadequate comment on sperm count and motility and interpretation of seminal fluid findings On the other hand, in the appendix one finds a useful list of the endocrine products and other information At the end of several chapters the author has added brief comments on how to avoid common pitfalls in relation to the subject under discussion. Obviously the author has had a large and active experience in clinical gynecology The book is in no sense a complete reference volume but intended to be a practical immediate reference work for conditions which confront the general practitioner in his office. It is brief, straightforward and clearly written No doubt many physicians in general practice will find it a conveniently useful and an easily read book

**Hospital Care of the Surgical Patient A Surgeon's Handbook with an Appendix on the Treatment of Wounds** By George Crile Jr M D and Franklin L Shively Jr M D Foreword by Evarts A Graham M D Bixby Professor of Surgery Washington University School of Medicine St. Louis Mo Second edition Cloth Price $3.50 Pp 288 with 25 illustrations Springfield Ill Charles C Thomas 1946

That need for a book of this type has long been recognized is evidenced by numerous similar publications now on the market The authors have approached the problem with a complete absence of the dogma which so often characterizes preoperative and postoperative care Their methods are based on strictly physiologic observations specific applications of which are briefly reviewed in connection with every therapeutic measure. This little book is intended for surgical interns and house officers but it could well serve any surgeon It is especially useful in the so-called routine procedures No treatment should ever be routine." This is a common failing in many surgical services where pressure of time and convenience often perpetuate technics long outmoded The authors rightfully point out that individual care of the patient demands as much diversity in premedication and postoperative care as does the operation. Parenthetically it may be added that English authors show a fondness for this type of book and there are many published by them. None compare with this in modern concept and practicality The volume can be summed up as superb

**The Migraine Lesion Describing the Relief and Cure of Typical Migraine by Means of Manipulative Therapy** By H Vincent Langley Cloth Price 6s. Pp 26 with 9 illustrations London Research Books Ltd distributed by Wm Heinemann Medical Books Ltd 1945

This work develops the concept that migraine can be cured by manipulation of the neck. Even though its author is a British specialist in manipulative therapy, his technics resemble those of the chiropractors

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES THEY DO NOT HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED EVERY LETTER MUST CONTAIN THE WRITER S NAME AND ADDRESS BUT THESE WILL BE OMITTED ON REQUEST

## TREATMENT OF OBSTINATE CONGESTIVE HEART FAILURE

*To the Editor* —A man aged 66 has had symptoms of an enlarged heart and myocardial degeneration for several years At the present time he is almost an absolute bed patient His chief complaints are shortness of breath and a sense of tightness in the chest, both when at bed rest and up The blood pressure is 140/86 The heart is enlarged about two and one half times the normal size Murmurs are heard over all valve areas on both systole and diastole The lungs are essentially normal Auscultation reveals an occasional wheeze There is occasional slight edema of the feet X ray examination of the chest shows some findings of chronic bronchitis Electrocardiograms confirm the diagnosis of chronic valvular heart disease and myocardial degeneration Intradermal tests with the usual substances do not show any sensitivity The patient has been given digitalis theobromine aminophylline iodides ammonium chloride barbiturates and narcotics for sedation and rest in bed Although recommended and maximum doses have been given, there has been only slight relief of shortness of breath Please discuss treatment

J Palmer Moss M D Memphis Tenn

ANSWER —More exact details of history, physical examination, electrocardiogram and x-ray findings are needed to establish an adequate diagnosis before prognosis and treatment can be discussed Is this an old rheumatic heart disease with aortic and mitral valve involvement or is the cardiac enlargement with apparent failure due to syphilitic aortitis with aortic regurgitation and secondary mitral murmurs? Is there calcific aortic valve disease or is there some other condition present? Is the dyspnea in part due to chronic bronchitis with emphysema or is it due to a complicating pulmonary embolism? A more exact description of the murmurs is necessary Are the neck veins full? Has there been any fever or leukocytosis?

Details of past treatment is also important How much digitalis and ammonium chloride have been given? Have mercurial diuretics or a low sodium intake been used?

If this case is one of chronic valvular heart disease with definite enlargement and congestive failure, then the routine measures for congestive failure should be applied Five aids in treatment, in the order of importance, are

1 Digitalis in ample dosage.

2 Rest in bed and chair

3 Diuretics including ammonium chloride and, when necessary, mercurials such as mercupurin or mercuhydrin intravenously or intramuscularly in a dosage of 1 to 2 cc every few days if necessary in order to clear all evidences of congestion

4 A low sodium intake, strictly applied, with fluid *ad lib* provided the sodium intake is low

5 Symptomatic treatment for other conditions

It is quite possible, from the description given, that the additional two measures that would be most useful on the supposition that this patient has obstinate congestive heart failure would be the mercurial diuretics and a low sodium intake

## HYPERTROPHY OF THE PROSTATE

*To the Editor* —May I have some information concerning hypertrophy of the median lobe of the prostate and median bar hypertrophy? Is there any palliative relief for a patient aged 61 whose cardiac condition rules out any surgical procedure? I have not been able to obtain cystoscopic examination of this patient The rectal examination of the prostate is negative the urine normal blood chemistry negative, culture of specimen after massage of prostate negative, residual urine about 3 drachms (11 cc) At times there is some increased urgency and the patient usually has to void once during the night For several months he has had an irregular low grade fever in the evenings for which a cause cannot be found Every day for several weeks at about 6 p m there will be a chilliness followed by fever of 99 to 99 4 F lasting two to four hours Could a median bar hypertrophy with the findings as outlined be the cause of this fever? If and when it is possible I shall obtain cystoscopic examination of this patient but if you are able to offer any suggestions it will be appreciated especially as regards any possible palliative treatment

M D New Mexico

ANSWER.—There is quite general confusion concerning the terms used, but when one says 'median lobe hypertrophy' that indicates a regular, smooth hyperplastic enlargement of tissues arising from the floor of the vesical neck and protruding into the bladder This tissue cannot be felt by rectal examination but is diagnosed only by cystoscopy There is no such lesion as "median bar hypertrophy" What is meant, perhaps, is "median bar formation," which is a fibrous or muscular protrusion of tissue on the floor of the bladder neck usually causing obstruction to the outlet of the bladder These may be congenital, as they are seen in boys aged 3 and 4 years and up or they may be acquired, the result of long-standing prostatitis and seminal vesiculitis Obviously they can be diagnosed only by cystoscopic study

There is no good palliative relief from symptoms of these obstructions unless one would consider intermittent catheterization as palliative or a permanent suprapubic cystotomy as palliative The indications are, of course, for some sort of surgical removal of the obstructing tissue, and with the bar formations these should be done almost always by transurethral resection of the tissues, but, in the hypertrophies, some should be enucleated and other smaller ones can be adequately removed by transurethral resection

Judging from the statements concerning this patient, it is not logical to give any treatment whatever until a diagnosis has been made, and this can only be done by cystoscopic study

## PARALYSIS AND DEATH FOLLOWING SPINAL ANESTHESIA

*To the Editor* —I should like some information concerning spinal anesthesia with subsequent paralysis as a complication Twelve years ago I gave a spinal anesthetic to a perfectly healthy woman and performed a simple appendectomy Immediately following the operation the patient went into shock, having a fast pulse, subnormal temperature and profuse sweating which appeared to be a circulatory collapse With proper treatment infusions and transfusions the patient reacted well, but on the third day she began to complain of pain in both lower and upper extremities Opiates were necessary to relieve her On the tenth day she began to develop a flaccid paralysis of all extremities and the following day there was a complete absence of all reflexes During this time the patient did not have a temperature of over 100 F The spinal fluid was normal The patient lost no tactile sensations at any time For several weeks following this the patient s paralysis progressed to the point where she had no use of her extremities, and she has remained in this condition up to the present Consultants were called in at the time of her illness and a diagnosis was made of poliomyelitis About two weeks ago I performed an appendectomy on a man aged 64 who had acute appendicitis. He was given the same type of spinal anesthesia, 150 mg of procaine crystals being used The operation consumed about thirty minutes and the patient was returned to his room in perfect condition This patient's convalescence was uneventful while in the hospital and he walked out of the hospital on the sixth day On the seventh day I was called to his home to see him because he was unable to rise from the dinner table He stated that he had no difficulty on walking to the table but on arising he was unstable and had very little control of his lower extremities he was assisted back to his bed Examination revealed the blood pressure to be 180 50 points above his normal blood pressure the pulse rate was 80 The patient stated that he felt fine with the exception of a slight headache that morning and the fact that he was now unable to use his legs His reflexes were entirely absent, but all tactile sensations were present The following morning the pains in his legs became excruciating, and the paralysis involved his upper extremities Opiates were necessary to relieve his pain The patient continued in this condition for four days and then his pulse became rapid and his temperature rose to 104 F He complained *of dyspnea and he died within a few hours Spinal fluid examination* the day before was negative The patient at no time lost control of his bladder A consultant was called in and a diagnosis of poliomyelitis was made on this patient These cases were almost parallel in their progress except for the fact that the former patient did not die It is hard for me to reconcile a diagnosis of poliomyelitis in these cases and I should like to know whether a spinal anesthetic could in any way produce the pictures described If so, how?

M D Texas

ANSWER —The 2 cases described pose many interesting questions The only way in which the patients could have had poliomyelitis would be that they had it before their spinal anesthesia was started Frequently infections of the central nervous system have at the onset abdominal pain as one of their symptoms It is more probable that the symptoms in the first patient may have developed because of the spinal anesthesia The anesthetic drug used may have reached the medulla oblongata and produced respiratory and circulatory collapse Following resuscitation brachial and lumbosacral radiculitis may have then developed, which resulted in a flaccid paralysis without sensory loss Although this is a very rare complication now—if it ever occurs—it was seen on occasions early in the use of spinal anesthesia This type of reaction was due in all probability to the chemotoxic properties of the drug and possibly to defects in the technical administration The second case is, on the other hand more difficult to explain because of the late onset Certainly a virus disease of the central nervous system or a cerebrospinal vascular lesion could have resulted in paralysis and death However, it is more likely that the spinal anesthetic either in the form of a chemotoxic reaction or an irritation of preexisting cerebrospinal disease was the cause of death The cases described are rare and certainly do not appear to be poliomyelitis—especially with negative spinal fluids

## THE TREATMENT OF EARLY SYPHILIS WITH PENICILLIN

COMMITTEE ON MEDICAL RESEARCH AND THE UNITED STATES PUBLIC HEALTH SERVICE

*A Joint Statement*

A nationwide study of the effect of penicillin in the treatment of syphilis was begun Sept 1, 1943 under the auspices of the Committee on Medical Research of the Office of Scientific Research and Development On Jan 1, 1946 the financing and general supervision of the project was taken over by the National Institute of Health, U S Public Health Service Prior to this date the study was directed by the Penicillin Panel of the Subcommittee on Venereal Diseases, National Research Council, composed of official representatives of that committee (J E Moore, chairman, and J F Mahoney), of the Committee on Chemotherapeutics and Other Agents (W B Wood Jr ), of the Army (T H Sternberg), of the Navy (Walter Schwartz, later J W Ferree) and of the Public Health Service (J R Heller Jr ) With the transfer of the experiment to the jurisdiction of the Public Health Service the Penicillin Panel was replaced by an Advisory Committee to the National Institute of Health Syphilis Study Section, with the same membership as the aforementioned but with the addition of two clinicians (J H Stokes and H C Solomon) and of a biostatistician (L J Reed)

Participating in the study are forty-one clinics, including four installations of the United States Army,[1] one of the Navy,[2] thirteen U S Public Health Service Rapid Treatment Centers [3] and twenty-three civilian clinics [4] In addition seven laboratories [5] of experimental syphilis are cooperating on a group basis

The major effort of the cooperative study to date has been to define the usefulness of penicillin in the treatment of early acquired syphilis in adults To this end the cooperating clinics examine, treat and follow patients according to a uniform plan, record their results on specially designed forms and forward these to a central statistical unit now operating in the Department of Biostatistics of the Johns Hopkins University School of Hygiene and Public Health, where they are transferred to punched cards and analyzed statistically [6] This phase of the study has been described in a preliminary report [7] and is the subject of the present communication In addition to the study of penicillin in the treatment of early syphilis, the effects of penicillin in the prevention of prenatal syphilis, in the treatment of early infantile congenital syphilis, of certain forms of ocular syphilis (especially interstitial keratitis and optic atrophy) and of neurosyphilis have also been investigated Minor and incidental contributions have been made in late benign (gummatous) syphilis The study of latent syphilis and of cardiovascular syphilis has been purposely avoided because these are essentially long term clinical problems of less pressing importance The laboratories have been engaged in a study of the effectiveness of commercial penicillin and of its available fractions (G, F, X and K) in experimental syphilis in rabbits and are beginning to amass data which already have important clinical applications

The nationwide results in early syphilis presented in this report are based on information available to the Central Statistical Unit up to a cut-off date, Aug 1, 1945 As of this date, twenty-six different treatment schedules had been instituted by the Penicillin Panel These were intended to hold constant the method of

Read before a conference of penicillin investigators, held under the joint sponsorship of the National Research Council and the U S Public Health Service in Washington D C, Feb 6-7 1946

This paper is a joint report from the Committee on Medical Research and the United States Public Health Service. The work described herein was done under several contracts recommended by the Committee on Medical Research of the Office of Scientific Research and Development The names of the participating investigators and the institutions they represent appear in several footnotes

This paper is a partial report of a clinical investigation planned by the Subcommittee on Venereal Diseases National Research Council acting in an advisory capacity to the Committee on Medical Research of the Office of Scientific Research and Development The program was initially financed under several contracts by the Office of Scientific Research and Development and latterly taken over by the U S Public Health Service Because of the dual subvention of the program the report may be looked on as a joint communication from the Committee on Medical Research of the Office of Scientific Research and Development and the U S Public Health Service

administration (intramuscular) and to explore the time factor of treatment with penicillin alone within the ranges of four (actually three and three-fourths), eight (actually seven and one-half) and fifteen days, the dose factor within the forty-fold range of 0.06 to 2.4 million units, the factor of interval between injections within the range of three and six hours, the combination of penicillin with other agents (arsenic, bismuth and fever) and the effect of absorption delaying methods such as penicillin in peanut-oil-beeswax.

These twenty-six schedules are listed in table 1. Also shown are the dates on which a particular schedule was started and abandoned (a blank in the column "schedule ended on" indicates that the schedule was still in use on Feb. 1, 1946), the total cases treated by each schedule and the percentage of patients so treated who were actually followed for six to eleven months after treatment. The comparatively recent dates on which many of the schedules were started and the schedules for which adequate information is available were employed in the treatment of 6,558 patients (56.6 per cent of the total). The basic material from different clinics differs, sometimes materially, in such factors as race, age, sex, duration of disease and excellence of follow-up. For these reasons, differences in results as between different clinics might have been anticipated and actually did occur. The accumulated data will eventually permit a careful evaluation of results as between clinics and different sections of the country.

The group of patients with early syphilis constituting the basic material of this report was composed not only of individuals receiving treatment for the first time but also of a relatively small number who were retreated with penicillin following clinical or serologic failure, after having been originally treated with penicillin or with other agents. The group is thus heterogeneous, consisting of patients receiving treatment for the first time and of others retreated after failure.

TABLE 1.—*Penicillin Schedules Employed in Early Syphilis to August 1, 1945*

Including Dates Started and Ended, Number of Patients Treated and Percentage of Total Followed to Three Hundred and Eight Days After Treatment (Ten Months)

| Schedule | Agent* | Interval Between Treatments, Hours | Duration of Treatments, Days | Total P, Million Units | Oxophenarsine Mg | Bismuth Subsalicylate Gm | Schedule Started on | Schedule Ended on | Total Cases | Per Cent Actually Followed for 169-196 Days | Per Cent Actually Followed for 281-308 Days |

* P = sodium penicillin in aqueous solution. P.O.B. = calcium penicillin in peanut oil beeswax. M = oxophenarsine hydrochloride (usually mapharsen). B = bismuth subsalicylate in oil suspension. F = fever therapy mechanically induced.

small number of patients followed for appropriate intervals preclude discussion of fourteen of these schedules at this time. Reasonably satisfactory data are available as of Aug. 1, 1945 only for schedules A to G inclusive, and in addition schedules I, L, M, O and T. All of these deal with the effect of penicillin alone, with the exception of schedule O (0.3 million units of penicillin plus 320 mg. of arsenoxide) and schedule T (penicillin plus bismuth). The factors of continued additions of new patients to a given treatment schedule and the loss of old ones are reflected for example in the oldest schedule, G, consisting of 1.2 million units of penicillin in seven and one-half days. While more than 1,000 patients had been so treated as of Aug. 1, 1945, only 35 per cent of them had been followed for as long as eleven months.

## MATERIAL

From the start of this program to Aug. 1, 1945, 11,589 patients with early syphilis had been treated by the cooperating clinics. Of this number 10,482 (90.4 per cent) had been treated by one or another of the twenty-six schedules shown in table 1. The twelve

Failures have been defined as clinical relapse (mucocutaneous or neurorecurrence), serologic relapse (blood or spinal fluid) and reinfection. In the present state of knowledge it is not possible to segregate the lesions of clinical relapse from those of reinfection, and for this reason these two categories have been considered as a single entity. The group of failures moreover does not include patients classified as seroresistant, since the basic requirement for such a diagnosis as utilized in this study, that is, seropositivity at the end of the first year of observation, has not been fulfilled because of the time factor.

The cumulative failure rates have been based on the assumption that a patient examined at any period was under observation at all previous periods and that he was not a failure until actually observed to be so. On this basis a patient might have been a failure before actual discovery but is assumed to have been successful up to that date. Thus, if a patient was symptom free in the first and second months after treatment, was *not seen in the third and fourth months and relapsed* in the fifth month, he was considered to have been

under observation and to have been negative in the third and fourth months Two other assumptions by which cumulative failure rates may be estimated were also investigated, but that described, which incidentally gives the most conservative set of failure rates of any of the three assumptions studied, is the one hereinafter employed

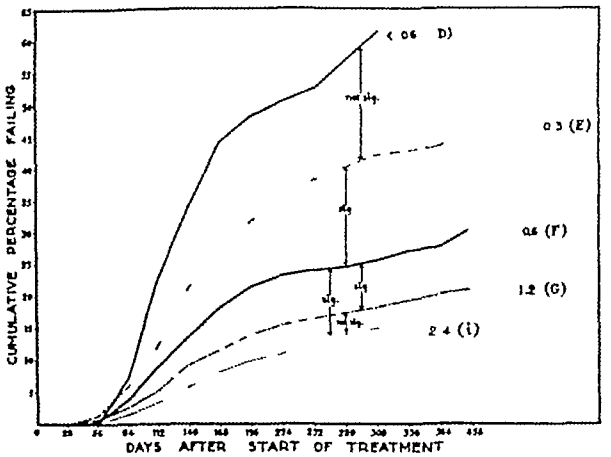

Chart 1 —Cumulative percentage failing by total amount of penicillin Penicillin only three hour interval seven to eight days duration

The total number of patients under observation in successive time periods decreased considerably, so that by the end of the eleventh month after treatment only about 20 per cent of the total number treated was under observation This decrease is the result both of the constant accretion of new cases and the loss of patients who could have been followed for a given time period but were not

## INTERPRETATION OF RESULTS

The results of the use of penicillin in early syphilis, to be presented, must be interpreted in the light of the changing character of penicillin itself As commercially supplied, and as employed in this study, penicillin is not a single substance but a mixture of several At least four, and possibly other, fractions of penicillin have been identified called in this country penicillins G, X, F and K The relative quantities of each of these fractions present in commercial penicillin has varied much from time to time and to an unknown extent in the industry as a whole as between different manufacturers or even at different times from the same manufacturer The relative therapeutic efficacy in syphilis of these several fractions is under study but has not yet been definitely determined Moreover, the potency of commercial penicillin in units per milligram of dried substance, has steadily increased during the progress of this study (from an original average in 1943 of about 200 units per milligram to the present level of 900-1 400 units per milligram) To the extent to which potency has increased, 'impurities" in commercial penicillin, which may themselves possess therapeutic activity, have decreased. The influence of these changes in commercial penicillin on these or other results of the use of penicillin in syphilis cannot yet be assessed

With these reservations in mind, it may be further said that positive statements in the remainder of this report are made only when statistical criteria for significance have been met Such statements, or other generalizations which are moreover applicable only to the twelve treatment schedules discussed, are based on the assumption that the findings in the patients actually traced are representative of the group as a whole

## RESULTS

*Cumulative Percentage Failing by Total Amount of Penicillin* —In chart 1 is shown the cumulative percentage failure rates for early (primary and secondary) syphilis as a group, observed under five different treatment schedules, in each of which penicillin was given by the intramuscular route over a seven and one-half day period at three hour intervals, the total dosage of penicillin ranging from 60,000 to 2,400,000 units The ordinate gives the cumulative percentage failing, and the abscissa records days after the start of treatment The different schedules produced no different failure rates in the first two months after the start of treatment Thereafter the failure rates became widely separate one from the other The highest failure rate at the end of eleven months was 62 per cent on schedule D, employing a total dose of 60,000 units Schedule I, utilizing a total dose of 2,400,000 units, gave the lowest failure rate, 15 per cent at the end of eleven months The other three schedules hold intermediate positions between these two extremes at levels ordered inversely with total dosage Beginning with a total dose of 300,000 units, doubling the dose resulted in progressively fewer failures but not in proportion to the increased amounts of penicillin The comparable values at the end of eleven months were 42, 26, 18 and 15 per cent respectively for total doses of 300,000, 600,000 1,200,000 and 2,400,000 units

*Cumulative Percentage Failing on Penicillin Alone and on Penicillin Combined with Arsenoxide* —Chart 2 shows the effect of adding 320 mg of arsenoxide to a standard amount of penicillin The cumulative results with schedule G (1,200,000 units) shown in chart 1 are included here for comparative purposes Schedule E, involving 300,000 units of penicillin given every three hours for sixty injections, in doses of 5,000 units per injection, produced a failure rate of 42 per cent at the end of eleven months The addition of 320 mg of arsenoxide (given in eight daily injections of 40 mg each) to this penicillin schedule reduced the failure rate

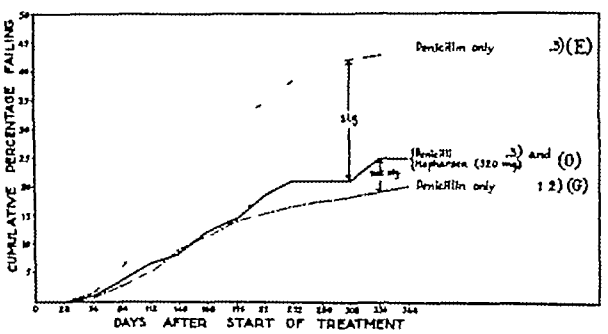

Chart 2 —Cumulative percentage failing Penicillin only and penicillin with oxophenarsine hydrochloride. Three hour interval seven to eight days duration

by one half, to 21 per cent The chart further demonstrates that the schedule involving 300,000 units of penicillin plus arsenoxide produced a failure rate no different from that employing 1,200,000 units of penicillin alone, i e four times as much penicillin Whether the latter conclusion will be confirmed by additional observations on a greater number of cases followed for a longer period of time remains to be seen

*Cumulative Percentage Failing on Penicillin Alone and on Penicillin Combined with Bismuth*.—Chart 3 presents a comparison between two schedules (G and T), each employing 1,200,000 units of penicillin at three hour intervals for sixty doses. Schedule T, in addition to this amount of penicillin, includes bismuth subsalicylate in a total dose of 0.6 to 1.0 Gm. Information available to the Central Statistical Unit does not carry observations on the latter group beyond two hundred days, but at one hundred and twelve days the failure rate with schedule G (penicillin alone) was approximately 5 per cent and with penicillin plus bismuth approximately 2 per cent. These two rates are significantly different. It is a matter of major importance to determine through further study and observation whether a larger proportion of penicillin-bismuth treated patients become seroresistant or develop late lesions of syphilis than the group given penicillin alone. Regardless of the eventual outcome of the individual case, the addition of bismuth to a penicillin schedule may be of public health importance in diminishing the incidence of infectious relapse.

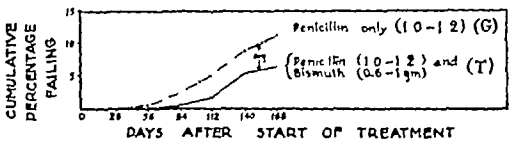

Chart 3.—Cumulative percentage failing. Penicillin only and penicillin with bismuth subsalicylate. Three hour interval, seven to eight days' duration.

*Cumulative Percentage Failing by Duration of Disease*.—Chart 4 depicts the cumulative failure rate in relation to the duration of syphilitic disease. Duration is defined as the interval between the day of the appearance of the initial lesion and the day of treatment. (The actual duration of infection is, of course, some three weeks longer, represented by the incubation period.) In order to avoid data based on the uncertain duration of the disease which usually characterizes the infection in the female, women have been excluded, and the results are based on a consideration of males alone, including only those who were able to date the appearance of the chancre with reasonable accuracy. The basic data consist of a combination of eleven of the twelve treatment schedules reported herein, schedule T having been omitted. This grouping is warranted by the fact that the distribution of the different schedules by duration of disease was essentially the same in these eleven schedules. The highest incidence of cumulative failures, 32 per cent at the end of eleven months, occurred in the group with infections of fifty-six or more days' duration (i.e., secondary syphilis). The best results (that is, the lowest incidence of failures, 14 per cent at the end of eleven months) were observed in the group whose infections were less than seven days in duration (i.e., seronegative primary syphilis). Intermediate relative positions in the chart are held by the groups with intermediate durations of disease. The findings are striking evidence of the general observation that, the longer the lapse of time between infection and treatment, the poorer are the anticipated results.

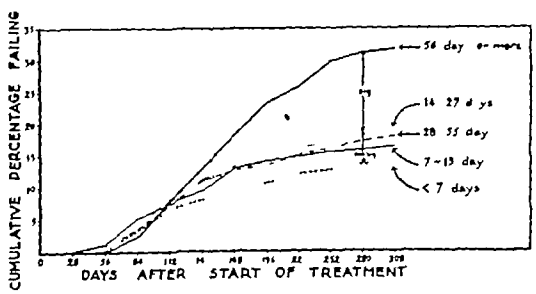

Chart 4.—Cumulative percentage failing by duration of disease. Males, eleven treatment schedules combined.

*Comparison of Failure Rates in Negro and White Patients and in Males and Females*.—The cumulative failure rates, determined for two different schedules, showed no essential difference in Negro patients as compared to white, and only slightly higher values in females as compared with males.

*Frequency of Relapse and Reinfection According to Treatment Schedule*.—No attempt will here be made to discuss the problem of relapse versus reinfection following the penicillin treatment of early syphilis. This highly controversial issue has been discussed in a recent editorial.[8] However, the cooperating clinics were asked to supply their own estimate as to whether a new dark field positive lesion appearing after penicillin treatment represented relapse or reinfection and in addition to submit to the Central Statistical Unit specific data on every patient in whom such a clinical failure was discovered. This questionnaire was so worded as to elicit information regarding each of the following criteria for reinfection:

1. The first infection was proved by dark field examination.
2. The patient received antisyphilitic treatment.
3. All evidence of syphilis must have disappeared after treatment and the patient shall have remained free from lesions in the interval between the first and second infection.
4. The serologic test for syphilis became negative after the first infection.
5. The serologic test for syphilis was negative at the time of the second infection.
6. A new chancre developed at a different site from the original chancre.
7. The new chancre was dark field positive.
8. There was no sign of activity at the site of the original chancre.
9. The spinal fluid was negative between the first and second infections.
10. The contact was demonstrated to have dark field positive lesions at the time of the stated exposure.

Table 2 presents, for each of eleven treatment schedules, the percentage of cases of failure which were classified by the cooperating clinics as relapse or reinfection.

TABLE 2.—*Penicillin Study of Early Syphilis*

Distribution of Failures as to Cause as Classified by the Cooperating Clinics by Treatment Schedule

| | Treatment Schedule | | | | Distribution of Failures Per Cent | | |
|---|---|---|---|---|---|---|---|
| Code | Interval Hrs | Duration Days | Total Dose Million Units | Number of Failures | Relapse | Reinfection | Other |
| A | 3 | 3¾ | 0.6 | 42 | 92.8 | 2.3 | 4.9 |
| B | 3 | 3¾ | 1.2 | 124 | 90.3 | 8.0 | 1.6 |
| C | 3 | 3¾ | 2.4 | 79 | 89.8 | 10.1 | 0.0 |
| D | 3 | 7½ | 0.60 | 35 | 89.5 | 2.8 | 8.5 |
| E | 3 | 7½ | 0.3 | 320 | 81.6 | 11.6 | 6.6 |
| F | 3 | 7½ | 0.6 | 175 | 80.2 | 12.0 | 1.7 |
| G | 3 | 7½ | 1.2 | 115 | 83.4 | 9.5 | 6.9 |
| I | 3 | 7½ | 2.4 | 90 | 86.6 | 10.0 | 3.3 |
| J | 6 | 3¾ | 1.2 | 40 | 82.2 | 10.5 | 2.2 |
| M | 6 | 7½ | 1.2 | 144 | 82.6 | 17.3 | 0.0 |
| O | 3 | 7½ | 0.3+ | 50 | 86.6 | 3.3 | 10.0 |
| | | | 300 mg Mapharsen | | | | |

Table 2 presents, for each of eleven treatment schedules, the percentage of cases of failure which were classified by the cooperating clinics as relapse or reinfection.

8. The Changing Concept of Reinfection with Syphilis and Its Applicability as a Criterion of Cure, editorial, Am. J. Syph., Gonor. & Ven. Dis. 29:474, 1945.

fection The "Relapse" group includes all cases of clinical or serologic relapse The "Reinfection" column includes all cases of possible reinfection as determined by the judgment of the clinic group Parenthetically, of 157 supposed reinfections reported as such by the clinics, the clinicians associated with the Central Statistical Unit would have agreed to the fulfilment of adequate criteria in only 2 The column headed "Other"

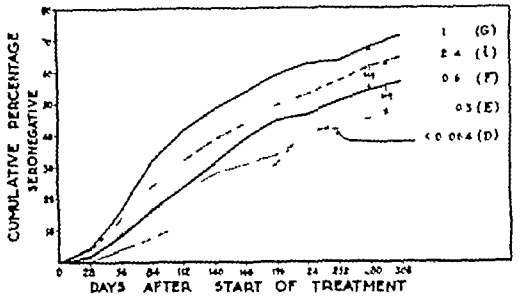

Chart 5 —Cumulative percentage becoming seronegative by total amount of penicillin Penicillin only three hour interval seven to eight days duration

includes failure because of the birth of a syphilitic child, because of treatment resistance or because of clinical or asymptomatic neurorecurrence Of all cases of failure, relapse made up from 81 7 per cent for schedule E to 92 9 per cent for schedule A The latter value, however, is based on a small group of 42 failures On schedules with 100 or more failures the percentage of failures which were probable reinfections varied from 8 1 to 17 4 When cases of serologic relapse were excluded and clinical failure alone was considered, the percentage of failures which were possible reinfections was roughly twice as high as that shown in the table, but for the eleven treatment schedules tested there was no definite order associated with amount of penicillin given, in the values for possible reinfections There thus appears to be no evidence suggesting that the rate of supposed reinfection was influenced by the amounts of penicillin given according to the schedules listed

*Cumulative Percentage Becoming Seronegative by Total Amount of Penicillin* —The cumulative percentage becoming seronegative on all treatment schedules having three hour intervals and seven and one-half days' duration is shown in chart 5 Only those patients seropositive at the start of treatment are included The phrase "becoming seronegative" is not intended to convey the impression of becoming and remaining seronegative, since all cases becoming seronegative in any observation period were excluded from the computations for all subsequent observation periods At the end of the seventh month the values range from about 30 per cent for the 60,000 units schedule D to 59 per cent for the 1,200,000 units schedule G In general there is an orderly progression of increasing cumulative percentage becoming seronegative with increasing total doses of penicillin An exception is noted with respect to schedule I, involving 2,400,000 units The 49 per cent value for seronegativity at the end of seven months of this schedule was significantly lower than the 59 per cent observed on schedule G, which utilized only one half as much penicillin Patients receiving 60,000 units of penicillin plus 320 mg of arsenoxide (not shown in chart 5) had a cumulative seronegativity rate comparable to the highest dosage of penicillin alone approximately 62 per cent at the end of seven months

With schedules involving three hour intervals and three and three-fourths days' duration, the expected results were reversed On such schedules a decreasing cumulative percentage becoming seronegative with increasing doses of penicillin was observed At the end of seven months the value for the 2 400,000 units schedule C, 25 per cent, was significantly lower than the values of 53 per cent and 62 per cent for schedules B and A, which employed 1,200,000 units and 600,000 units respectively An effort was made to determine if possible the reason for this unexpected result The three groups treated with schedules A, B and C did not differ significantly as to duration of disease When the rates were made specific for color and for sex the same direction of results as to seronegativity were found, and in fact the differences were even greater It was found that these three schedules were concentrated in certain clinics Fifty-five per cent of all cases treated with schedule A came from two clinics, the same percentage of all cases treated with schedule B came from a single clinic, and all the patients on schedule C were treated in seven U S Public Health Service rapid treatment centers These findings were therefore further explored

*Cumulative Percentage Becoming Seronegative by Clinic* —The cumulative percentage becoming seronegative in three different clinics each employing the same schedule I of 2,400,000 units in seven and one-half days was determined At the end of seven months the value for clinic 30 was 72 per cent, which was significantly higher than the 44 and 48 per cent respectively of clinics 2 and 44 These differences occurred in spite of the fact that 97 per cent of all patients treated in these three clinics were tested by a supposedly identical serologic technic The results in two clinics each employing the identical schedule of 600,000 units were then determined At the end of seven months clinic 35 reported a 54 per cent cumulative result becoming seronegative, a significantly higher value than the 39 per cent found in clinic 34, which however used a different serologic technic These differing results may perhaps be due to differences in the sensitivity of the serologic tests employed or in laboratories performing the same test It cannot be stated with certainty that the paradoxical results for seronegativity observed on schedules A, B and C are explicable on the basis of differences in clinic performance, but these differences did exist and warrant further study Likewise the dates between which these several treatment schedules were in use, and possible changes in the therapeutic efficacy of the penicillin employed at these times require additional evaluation

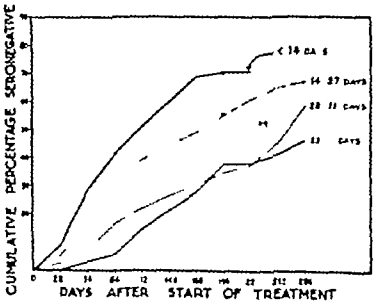

Chart 6 —Cumulative percentage becoming seronegative by duration of disease. Schedule I 2 to 2 4 million units three hours, seven to eight days

*Cumulative Percentage Becoming Seronegative According to Duration of Disease* —For this determination schedule I was employed throughout This schedule was in use by twenty-seven different clinics It was therefore selected for analysis on the assumption that because of the scattering among many clinics any clinic or laboratory difference that might have existed would in effect be neutralized Chart 6 is a graphic

presentation of the results At the end of seven months the group with infections of less than fourteen days' duration showed 70 per cent becoming seronegative, in contrast to the comparative values of 55 per cent, 34 per cent and 38 per cent for the groups with duration of infection from fourteen to twenty-seven days, twenty-eight to fifty-five days and fifty-six or more days before treatment In general the shorter the duration of the disease, the higher the cumulative percentage becoming seronegative at the end of seven months

*Herxheimer Reactions*—The distribution of Herxheimer reactions by eleven different treatment schedules is shown in table 3 From 28 to 69 per cent of the patients receiving treatment with these various systems had no recorded evidence of therapeutic shock The different treatment methods showed significant differences among one another with respect to this variable, but there was no evidence of any systematic or orderly differences among schedules A similarly erratic pattern is observed when the grade of the Herxheimer reaction is studied Here again there is evidence of significant differences among the several schedules so far as the frequency of reactions of different

TABLE 3—*Penicillin Study of Early Syphilis*

Distribution as to Herxheimer Reactions as Classified by the Cooperating Clinics by Treatment Schedule

* Cases with no data on Herxheimer reaction excluded

grades is concerned, but no uniform trend or clear pattern emerges Variations among clinics with respect to the accuracy of their clinical examinations and criteria for grading may perhaps alone be responsible for the erratic nature of these findings

None of the twelve schedules studied produced any of the more serious reactions There were no instances of bismuth stomatitis or nephrosis, or of hepatitis, blood dyscrasia, toxic encephalopathy, peripheral neuritis or death Fourteen cases of urticaria occurred, 6 of these on schedule I There was only 1 instance of bloody diarrhea, this in a patient receiving penicillin plus arsenoxide Secondary fever occurred in 152 patients, distributed more or less uniformly among all treatment schedules There were 2 instances of angioneurotic edema, both patients having been treated with schedule I

## SUMMARY

The following statements are based on the evidence presented in the body of this report, refer to the treatment schedules analyzed and are to be interpreted with the indicated reservations as to the changing character of penicillin

I EVIDENCE OF TREATMENT FAILURE—A *Total Dosage*—The cumulative percentage failure at the end of eleven months after treatment varied from 15 per cent (2,400,000 units) to 62 per cent (600,000 units)

B *Combined Drugs*—The cumulative percentage failure at the end of eleven months with a total dose of 300,000 units was twice as great when it was given alone as when it was given in combination with 320 mg of arsenoxide (42 per cent versus 21 per cent) This combined dose gave the same results as penicillin alone at a total dosage of 1,200,000 units

The cumulative percentage failure at the end of four months with 1,200,000 units was twice as great when penicillin was given alone as it was when given with 0 6 to 1 0 Gm of bismuth (5 per cent versus 2 per cent)

C *Duration of Disease*—For long durations of disease the failure rate was higher than for short durations For a duration of two months or more the failure rate at the end of eleven months was twice that of those treated within the first week of the disease (32 per cent versus 14 per cent)

D *Color and Sex*—There was no evidence of a difference between colored and white races by the end of eleven months The female failure rate was slightly higher than the male

E *Reason for Failure*—The failures were considered by the clinics to be relapses in about 85 per cent and possible reinfections in about 10 per cent There were no appreciable differences in these proportions for different schedules

II EVIDENCE OF SERONEGATIVITY—A *Percentage Becoming Seronegative*—The cumulative percentage becoming seronegative by the end of the seventh month ranged from about 30 for patients receiving less than 60,000 units to about 50 for patients treated with 1,000,000 or more units on three hour seven and one-half day schedules Patients treated with 300,000 units of penicillin plus 320 mg of arsenoxide had an accumulated seronegativity rate comparable to that obtained with the highest dosage of penicillin alone

For patients on three hour three and three-fourths day schedules these findings were reversed The group receiving 600,000 units had an accumulated percentage seronegativity of 62, while only 24 per cent of patients receiving 2,400,000 units became seronegative by this time When these rates were made specific for color and sex, the same results were found The groups *did not differ significantly as to duration of disease.* They were, however, concentrated in certain clinics

B *Clinic Differences for Same Schedules*—A comparison of different clinics handling the same treatment schedules showed definite differences in the percentage becoming seronegative It was not possible to test whether this factor accounted for the unexpected results for seronegativity with increasing doses in the three hour three and three-fourths day schedules, since there was no single clinic using all three schedules In view of the differences in clinic results, it is deemed advisable to compare results on seronegativity for different treatment schedules only if there is a general scattering of clinics involved, or if the results from a single clinic can be compared Where different schedules are concentrated in a few and different clinics, any comparisons may be misleading, at least until the differences arising from laboratory technics are evaluated

C *Duration of Disease*—For schedule I (2,400,000 units) the percentage becoming seronegative by the end of the seventh month showed a decrease with increasing duration of disease Those with lesions of at least two weeks' duration before treatment had a cumulative percentage of 70 becoming seronegative by

the seventh month after treatment, while those having had the disease for more than eight weeks had a rate of only 38 per cent

III HERXHEIMER REACTIONS.—The several treatment schedules differed significantly among one another as to both the incidence and the severity of Herxheimer reactions. Although these differences were noted, there was no clearcut pattern which could be discerned. The results for different schedules could be accurately compared only if these are scattered generally among the various clinics or, alternatively, if the results from a single clinic employing several different schedules are available for analysis.

No serious reactions occurred in patients treated with any of the twelve treatment schedules reviewed.

---

## THE CHANGING CHARACTER OF COMMERCIAL PENICILLIN

### With Suggestions as to the Use of Penicillin in Syphilis

COMMITTEE ON MEDICAL RESEARCH, THE UNITED STATES HEALTH SERVICE AND THE FOOD AND DRUG ADMINISTRATION

A Joint Statement

Chemical information concerning penicillin has been withheld during the war. The first published statement dealing with the chemical constitution of the drug appeared as a joint communication from the British Medical Research Council and the American Committee on Medical Research in December 1945.[1] This statement provided information as to the existence of four different types of penicillin designated in the United States as G, X, F and K. It was indicated that these were identifiable chemical compounds, distinguished from one another in the side groups attached to a common nuclear structure. Even before the appearance of this report, information had become available (by personal communication from various sources) that the penicillins of different manufacturers might differ in their relative proportions of fractions G, X, F and K, that the product of the same manufacturer might differ in this respect from time to time and that a considerable change in the relative proportions of these species present in commercial penicillin had actually occurred, probably as a gradual phenomenon during 1944. Prior to this time commercial penicillin was apparently predominantly penicillin G or a mixture of G and F. Subsequently the G content in the product of some, if not all, manufacturers decreased considerably, with a relative increase in fractions F and K, especially the latter. It is probable that penicillin X has been present only in small proportions, if at all, in most commercial penicillins at any time during the past three years, though some manufacturers apparently concentrated on attempting to attain 40 per cent or more X and marketed their products as such. These changes in the relative content of penicillin species have occurred because of the use in commercial production of various strains of Penicillium notatum or Penicillium chrysogenum and because of different technics observed in the growth of the mold and in the purification of the final product.

In addition to the change in the relative content of penicillin fractions there has also been a considerable change in the character of penicillin in the direction of increasing purity. The manufacturing producers have devoted great attention to the production of penicillin of increasing purity in units per milligram, with a corresponding decrease in the amount of impurities present. The penicillin that was originally available and employed in the nationwide syphilis study presently to be mentioned had an approximate potency of 200 units per milligram, which has gradually increased to the present level of 900-1 400 units per milligram.

Meanwhile, Dunham and Rake[2] had produced some evidence to indicate that commercial penicillin as available about two years ago contained impurities which might themselves possess treponemicidal properties. Their work suggested that the less pure the penicillin in terms of units per milligram the more effective it was in the prophylaxis of syphilis in experimental animals. Lewis[3] had likewise shown that impure penicillin exercised an inhibitory effect on the growth of sarcoma cells in tissue culture while no such effect was demonstrable with more highly purified products. Clowes[4] has observed a similar inhibition of development of sea urchin eggs or their actual destruction after exposure to a solution of "impurities" derived from commercial penicillin, whereas crystalline penicillin had no such effect. Hobby[5] has also noted that penicillins of low potency in units per milligram are apparently more effective in streptococcic infections of mice than are more purified products. These studies, suggesting but far from proving that impurities remaining in commercial penicillin after removal therefrom of all penicillin activity may be therapeutically effective, have not yet been verified.

Information has also begun to appear indicating that the several molecular species of penicillin vary significantly and unpredictably in their in vitro activity against a variety of bacteria,[6] and it is at least suggested that in certain infections in vitro activity may not be an adequate measure of in vivo activity. It is worth while pointing out that potency of penicillin is spoken of in terms of its in vitro activity against a special test strain of Staphylococcus aureus, that absorption and excretion studies are carried out by means of biologic assay against a variety of organisms, usually Staphylococcus aureus or Streptococcus pyogenes and that up to this point these two bits of information have been related to the possible activity of penicillin against other pathogenic organisms e g Treponema pallidum. This is certainly a non sequitur.

On Feb 6-7, 1946 there was held in Washington, under the joint auspices of the National Research Council and the United States Public Health Service, a conference of investigators who have been engaged in a study of the effect of penicillin in syphilis. Presented at that conference among other reports were the results of two years' study of the effect of various treatment

schedules in early acquired syphilis in man These data are recorded in factual fashion in this issue of THE JOURNAL

The relative activity in experimental syphilis in rabbits of penicillins G, F, X and K has been under organized investigation in several different laboratories

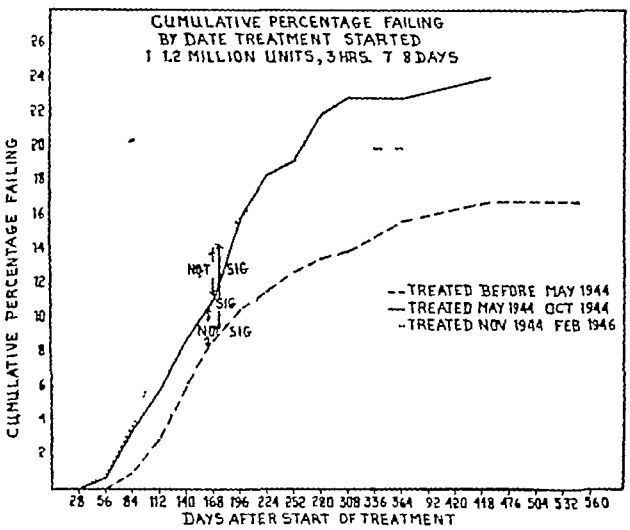

Chart 1 —Cumulated relapse rate in patients with early syphilis treated with an identical schedule (1 2 million units of penicillin in seven and one half days) at three different time periods sig' indicates statistical significance

under the direction of a subcommittee composed of Eagle (chairman), Chesney, Mahoney and Rake These studies, utilizing pure crystalline G and X and impure preparations of F and K (active material in each stated to consist of at least 90 per cent of F or K respectively) have been inaugurated at varying times within the past six months, depending on the availability of the products Each investigator has treated rabbits infected with the Nichols strain of T pallidum, treatment carried out six weeks after inoculation by a standard schedule comprising a total of twenty-four intramuscular injections given at four hour intervals over a four day period Each fraction has been tested within the dosage range 500-16,000 units per kilogram of body weight

Within a week after the February 6-7 penicillin conference, disturbing information became available as a personal communication from Chesney,[8] confirmed within a day or two by a similar personal communication from Mahoney and Arnold[9] Each of these investigators has studied penicillin K by the method outlined Each of them reported that in their laboratories clinical relapses had begun to appear within two to three months of treatment in a significant number of rabbits treated at all dosage levels, including the largest dose employed, namely 16,000 units per kilogram of body weight Meanwhile, information had been provided from the laboratories of Eagle,[10] Fleming[11] and Mahoney and Arnold[9] to indicate that the CD 50[12] of commercial penicillin in experimental rabbit syphilis, employed by an almost identical treatment system as was used with the purified penicillin species, was on the order of 1,500-2,000 units per kilogram of body weight Fleming,[11] who had been assigned the study of penicillin G, likewise reported by personal communication that the CD 50 and CD 95 of G closely approximated that of commercial penicillin manufactured about two years ago It was apparent therefore that there was at least a tenfold difference between the in vivo activity of penicillin G and penicillin K and that the latter penicillin species was at least relatively ineffective in rabbit syphilis

Within another few days Shaffer[13] of Detroit pointed out that in his hands, in early syphilis in man, a treatment schedule involving the administration of 2 4 million units of commercial penicillin in fifteen days (patients treated after December 1944) was less efficacious than 1 2 million units given in three and three-fourths or seven and one-half days (most of these treated prior to December 1944) In each of these three schedules employed by Shaffer, sodium penicillin was given intramuscularly in aqueous or saline solution every three hours day and night for the total time period specified

These two bits of information prompted an immediate examination of the results obtained with 2 4 million units of commercial penicillin in fifteen days at the Johns Hopkins Hospital[14] The results in 64 patients with early syphilis treated by this schedule during the time period November 1944-July 1945 were compared with those in 106 patients chosen at random from the nationwide material who were treated with 1 2 million units in seven and one-half days between June 1943 and March 1944 Although the 2 4 million units fifteen day schedule was favored because it had been in use for a shorter time than the 1 2 million units schedule, seven and one-half days, the results were distinctly poorer with the former, both in terms of relapse and in terms of seroresistance Also the composite curves of serologic response of the two series indicated

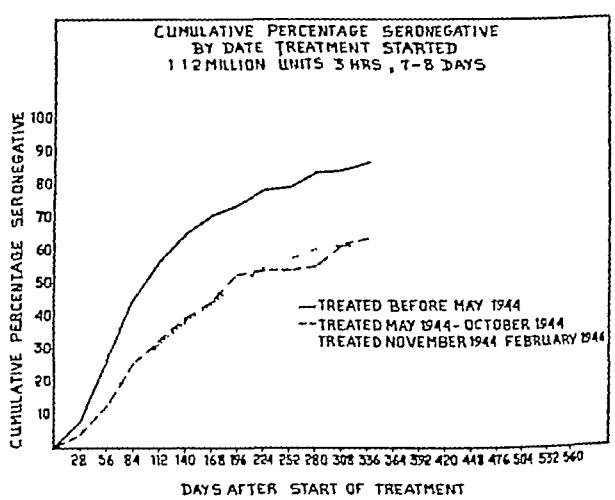

Chart 2 —Cumulated percentage of patients with early syphilis becoming seronegative after treatment with an identical schedule (1 2 million units of penicillin in seven and one half days) at three different time periods

that in this respect also 2 4 million units in fifteen days gave less satisfactory results than half the dose in half the time

Further to check this chemotherapeutic paradox, the Central Statistical Unit in the Johns Hopkins School of Hygiene and Public Health has determined on a nation-

14 Moore J E Personal communication to the authors

wide basis and on a much larger scale the cumulated relapse rate and the cumulated rate of attained seronegativity in a large group of patients (1,280) with early syphilis treated with an identical schedule, 1 2 million units of commercial penicillin in seven and one-half days, over three time periods (*a*) from June 1943 to May 1944, (*b*) from May 1944 to October 1944 and (*c*) from November 1944 to February 1946 These data are presented in the accompanying charts In patients treated prior to May 1944 the relapse rate is significantly lower, and the proportion of patients becoming seronegative is significantly higher than in patients treated since that date

The less satisfactory clinical results obtained in early syphilis since May 1944 suggested several considerations

1 There has been a sudden change in the biology of syphilitic infection. This possibility seems fantastically improbable

2 There has developed a strain of T pallidum resistant to penicillin. This also seems improbable, since penicillin resistance, in the same sense as arsenic bismuth resistance, has not been convincingly demonstrated anywhere in the cooperating clinics scattered over the entire United States

3 There has been a change in the character of commercial penicillin

The last of these possibilities is known actually to have occurred The change has been, as indicated, in two directions

(*a*) A change in relative quantities of penicillin species with a probable substantial decrease in the amount of penicillin G and an equal compensatory increase in the amounts of penicillins F and K, especially the latter present in commercial penicillin.

(*b*) The increasing purity of penicillin in terms of units per milligram and a corresponding decrease of possibly therapeutically active impurities

The demonstration by Chesney and by Mahoney and Arnold of the inefficacy of penicillin K in experimental syphilis in rabbits has prompted further immediate studies of the pharmacologic behavior of various penicillins in the body The results of a number of such studies have now become available (from Eagle and Musselman,[15] McDermott and his co-workers[16] and Coghill and his associates[17]) These studies agree in indicating that penicillin K provides much lower and much less well sustained blood levels than penicillins G, F or X They also indicate that, on the basis of the amount of penicillin recoverable in the urine penicillin K, in contrast to the other three penicillins, is largely destroyed in the body Further in conformity with these observations, Eagle and Musselman[15] have shown that penicillin K is one-sixth to one-fifteenth as efficacious in pneumococcic and streptococcic infections in mice as penicillins G, F and X, and Hobby[5] using a different preparation and a different method of administration, has found K to be half as active as G in the treatment of streptococcic infections in mice.

The conclusion seems inescapable that certain commercial penicillins produced within recent months are less efficacious in the treatment of syphilis than were the preparations available two years ago It is probable that some of the decreased therapeutic effect is due to the increased amount of penicillin K which has been present in the commercial preparations of many manufacturers The existence of other factors, such as the decrease in the amount of possibly therapeutically active impurities, must also be considered These several factors are under further intensive study in a number of cooperating institutions The penicillin manufacturers are likewise aware of the situation, are cooperating in the study and are taking practical steps in production to correct the identifiable difficulties

## SUGGESTIONS AS TO USE OF PENICILLIN IN SYPHILIS

In the meanwhile, and on the basis of the information provided as to the effect of penicillin in early syphilis in this and the preceding communication,[18] it is not as yet possible to outline the best method of use of penicillin in the treatment of early syphilis or of any other stage of the infection It is however possible to advance certain minimum suggestions for treatment on the basis of information at present available in the literature and shortly to be published, and to indicate a number of points to be avoided [18]

1 When sodium penicillin in aqueous solution is used for the treatment of syphilis in man, injections should be given by the intramuscular route every two to four hours preferably every two or three hours, day and night around the clock, for a minimum of seven and one-half to eight days The presence of penicillin K in commercial penicillin, probably in varying and unpredictable amounts for the next few months, should be compensated for by an increase in individual and total dosage and if possible by a decrease in the interval between individual injections from three to two hours

The minimum dose of previously produced and at present available commercial penicillin should be, for seronegative primary syphilis, not less than 3 6 million units (ninety injections of 40,000 units each given every two hours or sixty injections of 60,000 units each given every three hours), and for seropositive primary and early secondary syphilis not less than 5 4 million units (ninety injections of 60,000 units each or sixty injections of 90,000 units each)

For a first relapse (including reinfection, infectious or serologic relapse) of early syphilis after previous treatment of early syphilis this course should be repeated plus 360 mg of oxophenarsine hydrochloride (mapharsen) or an analogue given twice to three times weekly in six individual intravenous injections of 60 mg each plus 1,200 mg of bismuth subsalicylate given twice weekly in six individual intramuscular injections of 0 2 Gm each (see paragraphs 5 and 6 for a brief discussion of combined penicillin and metal therapy)

For a second relapse of early syphilis after previous penicillin treatment the patient should be transferred from penicillin entirely and placed on metal chemotherapy with arsenic and bismuth, preferably by the twenty-six week schedule employed by the Army and Navy (forty intravenous injections of oxophenarsine hydrochloride and sixteen intramuscular injections of bismuth subsalicylate)

(Evidence concerning the penicillin treatment of failures after previous penicillin therapy is not as yet satisfactory It is indicated that failure after previous failure is considerably more frequent than in patients never previously treated This may however be due only to the factor of duration of disease rather than to the existence of penicillin resistance of particular

18 The suggestions about to be given as to early and latent syphilis recapitulate recommendations made on April 16 1946 to the armed forces on request of the Surgeons General United States Army and Navy respectively by the Syphilis Study Section National Institute of Health

strains of organisms or of failure of the patient's own immune process.)

In later stages of syphilitic infection in adult (i.e. latent and late) syphilis the minimum dose should be not less than 3.6 million units, and in certain grave late manifestations of the disease, e.g. dementia paralytica, it should perhaps be as much as 10 million units, given over a minimum period of twelve to fifteen days.

2. In the treatment of infants, and in consideration of the gravity of infantile congenital syphilis, the minimum total dose should probably be greater than that advised for use in adults and should range between a total of 100,000 to 400,000 units per kilogram of body weight. In older children the dosage should be adjusted on a unit for weight basis with a minimum dose of 60,000 units per kilogram of body weight (corresponding to the minimum total of 3.6 million units for an adult).

3. Under no circumstances should penicillin in its at present available form be administered orally for the *treatment of syphilis*.

4. The only presently satisfactory method of absorption-delaying of penicillin is the administration of calcium penicillin in peanut oil-beeswax. Detailed information is not yet available as to the effects of this preparation in large series of patients with early syphilis or with any other stage of the disease. It is known, however, that a single intramuscular injection of 600,000 units will produce a therapeutically active blood level for from twenty to twenty-eight hours. If calcium penicillin in peanut oil-beeswax is used in any stage of syphilitic infection, the average daily dose for an adult should be 2 cc. (600,000 units) and the total duration of treatment from eight to fifteen days or longer, depending on the stage of the infection. For early syphilis a minimum total dose of 4.8 to 6.0 million units of this preparation is advised.

Calcium penicillin in peanut oil-beeswax should not be administered by the subcutaneous route, since under these circumstances the incidence of sensitizing reactions, with giant urticaria and angioneurotic edema, is excessively high.

5. There is evidence, both from the experimental laboratory[19] and from the clinic,[7] that the addition of arsenic (oxophenarsine hydrochloride) in subcurative dosage to a penicillin treatment schedule enhances the therapeutic effect of each drug. A suggested total dose of an arsenoxide for this purpose is 300 to 360 mg. administered in divided intravenous injections of 40 to 60 mg. each over a total time period of one to four weeks.

It is recognized that the administration of arsenic in this dosage introduces a risk of serious reactions or death in inverse proportion to the time interval of its administration. If 300 to 360 mg. is given within seven to nine days the expected mortality rate is approximately 13,000 to 14,000. If the same dosage is given over a total period of four weeks, this risk is reduced to about 130,000.

In view of this consideration, and of possible technical difficulties encountered in the administration of arsenic or in the mere prolongation of treatment necessitated thereby, opinion is divided as to the desirability of including this drug in a recommended penicillin treatment schedule. The majority opinion of a group of competent experts is that the results of penicillin alone, in the dosage and time recommended, would be satisfactory in a sufficiently large proportion of patients with early syphilis treated for the first time to justify eliminating arsenic from the original course of treatment, reserving its use for relapsing cases.

6. There is both clinical and experimental evidence to indicate that an insoluble bismuth salt administered intramuscularly in an oil suspension, e.g. bismuth subsalicylate, produces a slowly absorbed bismuth depot which continually releases small amounts of therapeutically effective bismuth for a period of from three to six months. There is likewise evidence to indicate that bismuth added to arsenic materially improves the results of mental chemotherapy. If bismuth is added to a penicillin or penicillin-arsenic schedule for early syphilis it may be anticipated that the incidence of infectious relapse within the first six to twelve months after treatment will be materially reduced. This is probably accomplished, for the first few months after treatment, by bismuth effect alone. Later relapse is perhaps prevented or minimized by the fact of development of the *patient's own immunity*. *Whether or not bismuth is of* value in effecting cure of the individual patient, it should nevertheless be of considerable aid in minimizing infectious relapse and thereby reducing the risk of spread of infection.

If bismuth is employed, the individual dose should be 0.2 Gm. (expressed as the subsalicylate, not as bismuth metal). A total of 1,000 mg. (five injections) given every other day for a total of nine days is unlikely to produce stomatitis except in patients with extremely bad oral hygiene, or renal damage in patients with previously undamaged kidneys. If the total dose is larger than 1,000 mg., injections should be given not oftener than twice weekly.

However, the opinion of a group of experts is also divided as to the desirability of including bismuth with the original course of penicillin in early syphilis. The majority believe, as for arsenic, that bismuth should be reserved for use in relapsing cases.

7. Commercial penicillin in the dosage and by the methods of administration suggested may be advantageously combined with fever therapy by means of induced tertian malaria in any form of neurosyphilis.

8. The use of sodium penicillin in aqueous solution is a hospital and not an office procedure. Injections of a few hundred thousand units given within one or a few days in a doctor's office are to be avoided.

It should be emphasized that these suggestions for the use of penicillin in syphilis represent a combination of medical desirability and expediency. They are based on information at present available, are only tentative, and are subject to revision within the next few months as further information accumulates.

It is also most vigorously to be emphasized that in the adoption of penicillin therapy for syphilis, the eventual value of which will not be determined for several years to come, the physician has a particular responsibility for careful follow-up and frequently repeated post-treatment observation on all patients so treated.

## SUMMARY

1. Penicillin as commercially distributed is not a single substance but a mixture of several. At least four different penicillin species which differ chemically in the side chains attached to the basic nuclear structure have been identified. These are known in the United States as penicillins G, X, F and K.

2. The relative content of these several penicillins *in commercial penicillin may vary from time to time*

19. Eagle H., Magnuson H. J. and Fleischman R.: The Synergistic Action of Penicillin and Mapharsen (Oxophenarsine Hydrochloride) in the Treatment of Experimental Syphilis, Ven. Dis. Inform. 27:1, 1946.

throughout the industry In recent months some commercial penicillins have contained a substantial proportion of penicillin K

3 The several penicillins vary in their in vitro and in vivo activity against a variety of bacteria

4 Penicillin K is relatively inefficacious against the several infections against which it has been experimentally studied Its inefficacy is apparently due to the fact that, unlike penicillins G, X and F, it is rapidly destroyed in the body

5 Commercial penicillin has also undergone a change in the direction of increasing purity (in units per milligram) with a consequent decrease in "impurities" which may possibly possess therapeutic activity

6 The changing character of commercial penicillin is reflected in the fact that the results of penicillin treatment of early syphilis have been less satisfactory since May 1944 than prior to that date

7 In view of these considerations, certain tentative plans have been adopted for the use of penicillin in the treatment of syphilis in man

8 The factors responsible for the apparent decrease in efficacy of commercial penicillin are under intensive cooperative study in laboratories and clinics working under the sponsorship of the National Institute of Health and by industry, and practical steps to meet the difficulty are in progress by industrial producers

## THE PROTECTIVE EFFECT OF VACCINATION AGAINST EPIDEMIC INFLUENZA B

THOMAS FRANCIS Jr, M D
JONAS E. SALK, M D
and
WILLIAM M BRACE M D
Ann Arbor Mich

### DISTRIBUTION OF INFLUENZA B IN 1945

The epidemiologic pattern of influenza B has not been well established In some years in certain areas it has presented the picture of a sharp short epidemic similar to that usually seen with influenza A This was the case in 1936 and 1940, the first epidemics identified as influenza B [1] Since 1940, however, several investigators have called attention to the fact that the disease may occur in a scattered manner during the respiratory disease season, independent of or interspersed with influenza A [2] In the past three years members of the Commission on Influenza of the Army Epidemiological Board have maintained a continuous alert for the detection of outbreaks of respiratory disease and their identification [3] This has consisted in serologic sampling of common respiratory infection in different service commands and prompt exploration of any increased prevalences The activities of the commission have also served to enlist the interest and aid of many medical officers who, knowing that the watch was kept, would report suggestive cases and furnish material to commission laboratories for diagnostic study or would seek to carry out the procedures in their own organizations Through these channels the pattern of influenza B during 1945 has become established

Influenza B was recognized in North America in the spring of 1943,[4] but between that time and the spring of 1945 no evidence of its occurrence was reported From March to November 1945, irregularly scattered, apparently localized upsurges of respiratory disease were identified as influenza B [5] They occurred throughout much of the United States, the Pacific Ocean area, Alaska and the Antilles department Civilian as well as military populations were affected The concentration of cases was extremely variable in different areas in Honolulu, a sharp civilian epidemic of 7,000-8,000 reported cases occurred, at certain military stations the disease seemed largely limited to European prisoners of war, in others, serologic tests on what seemed the normal run of respiratory disease revealed influenza B The disease was mild and varied from a large proportion of typical febrile illness of three to four days' duration, in some instances followed by pulmonary involvement, to transient indisposition and subclinical infection It is quite likely that much more of the disease in the civilian population was unrecognized and ignored However, the accumulated information identifies clearly a continued but shifting prevalence of influenza B for a period of eight months before its excess attracted attention in the general civilian population of the United States

The extensive distribution of the disease in the late spring and summer was considered to indicate the probable building up of a more definite epidemic wave during the latter part of the year This occurred, and in November and December identification of sharp civilian epidemics of the disease was made in this laboratory alone with material from the states of Michigan, Indiana, Illinois, Washington and Texas

### EFFECT OF VACCINATION AT THE UNIVERSITY OF MICHIGAN STUDY POPULATION

At the University of Michigan there were in residence for the fall term approximately 600 army forces who had been, with rare exceptions, subcutaneously vaccinated on Oct 16 1945 by United States Army authorities with combined, concentrated influenza A and B vaccine prepared from infected allantoic fluid [3] This was in accord with the general program adopted by the Surgeon General's Office The enrolment of another service unit averaged 1,100, and the civilian enrolment was about 10,000 The latter two groups were not vaccinated The two services were housed in university dormitories, the army group was divided in three dormitories, the other service unit occupied one large dormitory Sick call for the army

5 Reports from the Commission on Influenza to the Office of the Surgeon General U S Army Preventive Medicine Service Washington D C

group was held by an army medical officer at the University Health Service Patients with indications of upper respiratory infection and an oral temperature of 100 F were admitted as bed patients in the infirmary, where they were cared for by the University Health Service staff If the temperature was but 99 the patient

Influenza B among vaccinated and unvaccinated forces University of Michigan 1945

was usually sent to quarters but reported back the second day, if the temperature was 99 or more on the second day he was admitted

The second service unit held its own sick bay But all patients with oral temperatures as high as 100 F were sent to the Health Service Infirmary for admission The remainder were continued in quarters In general, then, cases of upper respiratory infection in the two groups were considered for admission to hospital beds on much the same basis

The civilian students were housed in a wide variety of establishments The conditions for their admission to the infirmary were much less uniform and less representative of illness in the entire civilian student body than in the other two groups Their data could not be properly compared with those of the service units

*Incidence in Vaccinated and Unvaccinated Military Units*—On Nov 7, 1945 at the Student Health Service, where a watch had been kept for changes in character or frequency of respiratory disease, a group suggestive of influenza was admitted as hospitalized patients to the infirmary Throat washings were obtained from 2 patients, and from 1 of these influenza virus type B was isolated in the virus laboratory on November 10, seventy-two hours after inoculation of throat washings and penicillin into the allantoic sac of fertile eggs Thereafter a continuous record of the admissions to the hospital for acute respiratory disease was maintained and once or twice weekly throat washings and blood were obtained from patients to provide a sample of cases in which etiologic studies could be carried out On December 22 Christmas recess began and extended furloughs and transfers took place, so that comparative data were no longer obtainable.

In the eight weeks from October 28 to December 22 inclusive there were 109 admissions for acute respiratory disease from the unvaccinated unit of 1,100 men—a rate for this period of 99 1 per thousand, while from the 600 men in the army unit there were but 7 admissions—a rate of 11 5 per thousand men (table 1 and chart)

Because of reasons stated, no comparison with civilian students is possible Nevertheless, material for study was obtained from samples of the 176 admitted cases

## ISOLATION OF VIRUS AND SEROLOGIC CHARACTERISTICS

During the period up to Dec 22, 1945 fresh or previously frozen but unfiltered throat washings from 29 patients were mixed with penicillin and inoculated into eggs in an effort to isolate virus From three to five passages were carried out before a negative result was recorded All twenty-nine were tested by the allantoic route,[6] and eight of these yielded strains which were established by egg passage, four of them on the first passage Thirteen throat washings were also tested by the amniotic route[7] with five strains established, two of them when allantoic passage was negative. The ten strains isolated were all identified as influenza virus type B Only one has been established in mice, and this strain was also maintained through fourteen passages in ferrets The turbinates of ferrets consistently presented a deep red congested appearance, but significant pulmonary lesions were uncommon

When tested in red cell agglutination reaction[8] against human acute and convalescent influenza B serum all strains were neutralized by the convalescent serum to titers four to sixteen times greater than those obtained with the acute stage serum, clearly characterizing them as type B The various strains were also tested with normal and convalescent serum of one ferret infected with the Lee strain and of another infected with one of the new strains (ALN) The former serum reacted characteristically with its homologous Lee strain but showed little demonstrable antibody to the new strains, while good inhibiting titers were found with the AL ferret serum against the fresh strains of virus and none

TABLE 1.—*Respiratory Disease Admissions During Epidemic of Influenza B, University of Michigan Health Service, 1945*

| Unit | Average Strength | Week Ended November 3 | 10 | 17 | 24 | December 1 | 8 | 15 | 22 | Total | Incidence per Cent |
|---|---|---|---|---|---|---|---|---|---|---|---|
| Army (vaccinated) | 600 | 0 | 0 | 1 | 2 | 1 | 0 | 2 | 1 | 7 | 1 15 |
| Other forces (unvaccinated) | 1 100 | 6 | 7 | 7 | 9 | 21 | 10 | 35 | 14 | 109 | 9.91 |

to the Lee strain There was thus little reciprocal cross inhibition of agglutinins with serums of ferrets immune to the old and new strains (table 2)

When serums from individual rabbits immunized by single intraperitoneal inoculations of different strains

Numbers represent titers as determined by Salk s modification of Hirst s technic.

strains in allantoic fluid contain some substance which in the presence of normal serum interferes with the agglutination of erythrocytes by virus and gives the same effect in the agglutinin inhibition tests as antibody does The normal serum effect may then be so high as to obscure the true antibody titer

### SEROLOGIC STUDIES OF PATIENTS' SERUMS

Acute and convalescent serums were obtained from 26 of the unvaccinated service unit admitted between Nov 7 and Dec 14, 1945 The serums were tested for antibodies by agglutinin inhibition[8] against the PR8 strain of type A and the Lee strain of type B None showed an increase of titer to influenza A, while 21 of the 26 showed fourfold or greater increase to influenza B, and two others were high in both tests, thus indicating that 23 of the 26 in the sample group had suffered from influenza B

During the same period similar tests were done against the Lee strain with serums from 17 civilian patients Twelve of them were positive. In only 1 instance did paired serums negative to the Lee strain show a rise in titer with newly isolated strains In fact, serums which had been positive with Lee strain frequently failed to give positive results with new strains—again because of apparently high titers in the acute phase serums caused by interference of the antigen with agglutination of erythrocytes in the presence of serum Virus was isolated from 2 of 6 civilian patients from whom convalescent blood could not be obtained

Material was obtained from only 2 of the 7 army personnel admitted for respiratory disease No virus was isolated from their throat washings, and they were transferred before convalescent serum could be obtained[8a] In 2 other instances specimens were not taken since it seemed clear that their admissions were not related to acute illness It is of interest, however, that after the comparative study was terminated the 1 soldier who was known not to have been vaccinated was admitted on December 26, virus was recovered from his throat washings, and his serologic test was positive for influenza B

The evidence shows that the great bulk of admissions for acute respiratory disease during the period of study was influenza B, since serologic tests on patients sampled at intervals were definitely positive in 35, or 81 4 per cent, of the 43 unvaccinated persons studied The limitation of illness in the vaccinated units seems to be clearly due to the prevention of influenza B

Additional evidence of the different experience of the two groups is indicated by the statements of the patients coming from the two units For example, the unvaccinated patient from the army unit on December 26 stated that he knew of only 1 other member of his company who had been sick since October Repeatedly, however, men from the other unit stated that many of the men in their barracks were sick but not reporting

### SUBSEQUENT OBSERVATIONS

After the termination of the comparative study on Dec 22, 1945, sampling of cases admitted to the infirmary was continued The strengths of the service groups diminished decidedly and nearly all cases have been in civilian students Throat washings from 11 additional cases had been examined by Feb 6, 1946, and five strains of type B influenza virus were established by amniotic inoculation, only one of them was positive by the allantoic route Positive serologic tests have also been obtained over the same period. These results furnish evidence of the continued identification of influenza B in the United States for a period of twelve consecutive months

### COMMENT

The evidence points directly to the fact that vaccination of the army unit at the University of Michigan with vaccine containing influenza virus types A and B produced such effective protection during an epidemic of influenza B that only 7, or 1 15 per cent, of the 600 men were admitted to the hospital for respiratory infection during the epidemic period In contrast 109, or 9 91 per cent, of an unvaccinated service unit living and observed under similar conditions required hospitalization. Comment has already been made on the suggestion that the amount of nonreporting illness, or illness of insufficient severity to require hospitalization, was also greatly different The extent of the epidemic is indicated by the fact that the incidence of hospitalized disease in the unvaccinated population was 9 91 per cent, while in the 1943 epidemic of influenza A at the University of Michigan[9] it was 8 58 per cent, although the same criteria for hospitalization obtained in the two studies The comparative result is even sharper than that noted in 1943 It is in keeping with indications obtained by experimental infection that vaccination induces a stancher degree of resistance against influenza B than against influenza A[10]

The strains of virus recovered during the epidemic differed serologically from the Lee strain of type B according to tests with ferret serum On the other hand, using the acute and convalescent serums from the patients, the increases in titer, with the red cell inhibition test employed, were usually more distinct against the Lee strain than against the current strains More-

8a Serum was taken from 1 of these at Camp Upton on February 18 two months after the original bleeding An increase in titer was noted against Lee from 128 to 512 and against new strains of <32 to 256

9 Salk, J E. Menke W J Jr., and Francis T., Jr A Clinical Epidemiological and Immunological Evaluation of Vaccination Against Epidemic Influenza, Am J Hyg 42: 57 (July) 1945

10 Francis T Jr Salk J E. Pearson H E., and Brown P N Protective Effect of Vaccination Against Induced Influenza A J Clin Investigation 24: 536 (July) 1945 Salk, J E Pearson H E Brown P N and Francis T Jr Protective Effect of Vaccination Against Induced Influenza B, J Clin. Investigation 24 547 (July) 1945

over, serums produced in rabbits against the new strains reacted clearly with the Lee strain Hence there was sufficient evidence that the strains were type B, although certain differences from the standard Lee strain were found The differences were not sufficiently great as to evade the effect of vaccination of the human population with the Lee strain The impression has been repeatedly formed in this laboratory that, with newly isolated strains in allantoic fluid, tests conducted by the agglutinin inhibition technic tend to overemphasize strain differences This must be borne in mind in identification of new strains

Epidemiologically, demonstration of the continued presence of influenza B in this country for at least an entire year, March 1945 to February 1946 inclusive, is of great interest What might casually appear to be a series of unrelated, circumscribed episodes actually represents a widespread, smoldering disease incidence breaking into epidemics at various points as favoring conditions for their development or for their recognition occur In November and December its scope was sufficient to bring widespread realization that it was of epidemic proportions in large portions of the civilian population in much of the United States Several observers have commented on the manner in which cases of influenza B straggle through the usual respiratory disease season, perhaps for several months [2] But the past year's experience is a persistent ebb and flow, the recognition of which was in large part due to the extended observations by members of the Commission on Influenza and other army laboratories

The evidence tends to support the concept of influenza B as a disease with widely varied epidemiologic appearances [11] but one which behaves commonly as an endemic disease with epidemic peaks at intervals of four to five years This would conform to the exaggerated incidence of the disease in the younger population groups during an epidemic, as demonstrated in 1936,[12] suggested by the observations of Taylor, Petrilla and Dreguss [13] and frequently mentioned in press reports of the past winter

As with influenza A in 1943, the present epidemic period was preceded by a detectable prevalence of the virus well in advance If such observations can be continued they may be of value in recommending the time at which vaccine should be administered For during this season again it was demonstrated that vaccination in advance of an epidemic permits proper observation, while waiting until the onset of an outbreak in a locality invites the risk of being too late

### SUMMARY

During an epidemic of influenza B in November and December 1945 at the University of Michigan it was possible to compare the incidence of the disease in an army unit of 600 men which had been vaccinated against influenza and another service unit of 1,100 men which had not The incidence among the vaccinated was 1 15 per cent, in the unvaccinated, 9 91 per cent

The strains of virus encountered differed serologically from the Lee strain of type B influenza virus included in the vaccine, but this did not appear to prevent the prophylactic effect of the vaccine

The epidemiologic pattern exhibited by influenza B was a continuous prevalence for a period of at least twelve months, representing an endemic disease with numerous epidemic upsurges

The evidence clearly indicates that subcutaneous vaccination with inactivated influenza virus types A and B exerted a striking protective effect against epidemic influenza B

## CURARE IN THE TREATMENT OF ACUTE POLIOMYELITIS

MAX J FOX M D
Milwaukee

Medical science as yet has found no specific therapy for the treatment of poliomyelitis Many drugs have been used in the attempt to aid convalescence, but only a few have proved to be of any value in supportive treatment For the time being, hot fomentations and early muscle reeducation seem to be the procedures of choice This method of treatment is based on the assumption that the disease is self limited and that these procedures in therapy will bring about maximum return of function in the infected individual Since no specific serum or chemotherapy is available, it is quite evident that this disease will run its course from day to day despite the many known therapeutic measures which might be undertaken With this premise in mind, the available therapy must be thought of purely as a means of abating the illness and of preventing the development of deformities, subluxations and residual spasms

In a previous article Spankus and I [1] reported our results with the use of neostigmine during the acute stage of poliomyelitis but, not having found this to be the answer to the problem, we were encouraged by the favorable report of Ransohoff [2] in the treatment of 4 cases with curare The commercial physiologic assayed preparation of curare was administered to 34 of the 223 patients with poliomyelitis admitted to the Milwaukee Health Department's South View Hospital between July and November 1945 I believe that this series of 34 cases represents a fair trial of the drug, and certain deductive conclusions seem worthy of publication

### PROCEDURE

The 34 cases represent a wide range in age, extent of disease and clinical type As recommended in the literature, 0 9 mg of curare per kilogram of body weight was used as a basis for judging dosages However, because of the narrow margin of safety we used our own judgment as to the "safe" dose for each individual, depending somewhat on the age and size of the patient In all cases curare was given as early as possible after the diagnosis of poliomyelitis, but the time varied because of the difference between the date of onset of the disease and the date of admission to the hospital Because of the very narrow margin of safety, we were prepared, in all cases, to begin artificial respiration or transfer the patient to a mechanical respirator

### RESULTS

The results have been summarized on the accompanying table

Assistance in formulating these statistics was given by Dr Robert E. Votteler

From the Department of Clinical Medicine Marquette University School of Medicine and the South View Hospital of the Milwaukee Health Department

| | | | 4 | | Repeated in ¾ hr | 1 0 | No change at 1 hr | No change at 1 hr |

* Curare was administered on the basis of 0.9 mg per kilogram of body weight.

Only 12 of the patients noted improvement after curare was administered but the lack of permanence in this subjective sense of improvement did not merit continuation of the drug Furthermore, although 20 of the cases are reported on the charts as showing minor improvements, it must be added that, with the exception of 2 of these cases, there was no definite certainty in the relaxation of the muscle spasm

From the grouping of the cases according to clinical types, it can be noted that the bulbar and spinal-bulbar cases in general showed the least response to this medication, while the best results, if any, were seen in the spinal paralytic types

Typical of the patients having bulbar involvement (patient 5), a spinal bulbar poliomyelitis, was a boy aged 8 years who had difficulty in swallowing and an absent cough reflex at the time we gave him the regular dose of curare Within an hour's time the respiratory effort became more aggravated and cyanosis was quite pronounced, so that the patient was placed in a mechanical respirator He remained in the respirator for twenty-seven days at South View Hospital and was transferred to a private hospital as a possible permanent respirator patient This result and the result in case 4 may indicate possible dangers of using curare in any form of bulbar paralysis

Cases 9 and 34 represent attempts to get improvement with repeated smaller doses of curare The results show no significant advantage in this procedure

Although curare has merited a place in anesthesiology and certain types of spastic clinical entities, its use is not warranted during the acute phase of poliomyelitis Curare may prove to be of more benefit in the residual spastic conditions after the patients have been released from the quarantine period I am not in a position to comment on its value because I have not investigated its effects in such circumstances

This series of 34 cases is offered as a conservative observation on the use and effectiveness of curare in poliomyelitis I hesitate to recommend its routine usage in isolation hospitals for poliomyelitis cases It surely should not be adopted for home treatment because of the lack of proper supervision and necessary facilities in the event of harmful manifestations

### CONCLUSIONS

1 Curare has been tried in 34 cases of poliomyelitis

2 Although a few of the patients noted subjective improvement, the findings, objectively, were not encouraging

3 Bulbar cases did not respond to this treatment, and in 2 cases a rapid downward course necessitated the use of artificial respirators

4 Curare may be in some instances of temporary benefit, but it is a dangerous drug and is not to be encouraged for the treatment of the acute phase of poliomyelitis

324 East Wisconsin Avenue.

## EFFECT OF PARA-AMINOBENZOIC ACID IN TSUTSUGAMUSHI DISEASE

LIEUTENANT NICHOLAS A. TIERNEY (MC) U S N R.

Tsutsugamushi disease, or scrub typhus, is an acute infectious disease caused by Rickettsia orientalis and is transmitted to man by a larval trombiculid mite This has been one of the severest diseases encountered by the troops in the Pacific and Asiatic theaters of the war Figures for the case fatality rates according to the U S Army reports have varied from 1 to 28 per cent, but the majority ranged between 10 and 15 per cent, with an overall case fatality rate of about 5 to 7 per cent While the average period of disability in these cases has been approximately three months, many of the patients have been unfit for duty for a much longer time Many drugs have been tried on this disease, but until now no effective therapeutic agent has been found

The possible value of para-aminobenzoic acid as a therapeutic agent against a rickettsial disease was first suggested by Snyder, Maier and Anderson[1] They reported that 80 per cent of their mice inoculated with murine typhus survived when they were fed on a ration containing para-aminobenzoic acid, whereas only 20 per cent of the control mice recovered

Hamilton, Plotz and Smadel[2] noted that large amounts of para-aminobenzoic acid inhibited the growth of epidemic and murine rickettsias in the yolk sac of developing chick embryos

An independent discovery by Grieff, Pinkerton and Moragues[3] confirmed these results They found that para-aminobenzoic acid inhibited the growth of murine rickettsias in both mice and eggs

Yeomans, Snyder, Murray, Zarafonetis and Ecke[4] studied the effect of para-aminobenzoic acid in clinical louse borne typhus They reported a series of 20 treated cases and 44 controls The patients were given for an initial dose 4 to 8 Gm of para-aminobenzoic acid and 2 Gm every two hours in an effort to maintain a blood concentration of between 10 and 20 mg per hundred cubic centimeters These workers reported that the para-aminobenzoic acid had a good effect in decreasing both the severity of the disease and the case fatality rate

From the United States of America Typhus Commission War Department Washington 25 D C

These studies were carried out at the 20th General Hospital and at the 94th Indian General Hospital Ledo Assam India

Sergeants Ralph Fine and Morton Hookaylo of the 20th General Hospital determined the para aminobenzoic acid blood levels Other assistance was rendered by nurses corpsmen and technicians of the 20th General Hospital and the 94th Indian General Hospital

Snyder and Zarafonetis [5] and Murray, Zarafonetis and Snyder [6] reported that the oral and parenteral administration of the sodium salt of para-aminobenzoic acid to mice infected with scrub typhus definitely reduced the mortality of the experimental infection

Through the courtesy and cooperation of Brig Gen I S Ravdin, U S Army and Col Francis C Wood, M C, A U S, of the 20th General Hospital, and Col J Palmer and Lieut Col George A Kiloh, R A M S, of the 94th Indian General Hospital, an opportunity was afforded the United States of America Typhus Commission to conduct a study of para-aminobenzoic acid on patients with tsutsugamushi disease in these institutions

These hospitals were located at Ledo Assam, India, which marks the beginning of the Ledo Road This road was built through jungle territory in which tsutsugamushi infected mites abound It was from this area of northern India and Burma that most of our tsutsugamushi admissions came

The severity of the cases admitted to the 20th General Hospital and the 94th Indian General Hospital has varied from time to time As a result, any study to evaluate a therapeutic agent would have been worthless unless this agent was tried in alternate cases or in a large series of consecutive cases In view of the impossibility of the latter it was decided to treat alternate cases Those not receiving para-aminobenzoic acid received the best supportive treatment possible The disease appeared somewhat less severe in the Indians than in the Americans and consequently a separate alternate series was studied at the 94th Indian General Hospital All the cases were alternately treated except 2 One of these was a control who turned out not to have tsutsugamushi disease. In the other instance 2 patients were treated consecutively as at that time there were so few cases being admitted that it did not seem worth while to continue the study, but subsequent results encouraged us to carry on

## METHOD OF TREATMENT

The para-aminobenzoic acid was given orally as a powder partly neutralized by a sodium bicarbonate solution, which has a tendency to lessen gastric irritation [4] This was accomplished by mixing 10 cc. of a 5 per cent sodium bicarbonate solution with each gram of para-aminobenzoic acid powder At first 6 Gm of para-aminobenzoic acid was given as an initial dose, and then 2 Gm every two hours However, as the blood concentration of para-aminobenzoic acid was slow to rise, it was thought that valuable time was being lost by this procedure Therefore 8 Gm was given initially, and then 3 Gm every two hours On this regimen a blood concentration of 30 to 60 mg per hundred cubic centimeters was usually reached within two days This proved effective and was well tolerated by the patients Since the drug is rapidly excreted in the urine, it is necessary to give it every two hours

There is considerable variation from patient to patient in the ability to build up and maintain a satisfactory blood level of para-aminobenzoic acid Consequently it is highly important to determine the blood concentration of para-aminobenzoic acid in each patient each day It is only by this means that the proper amount of the drug can be administered The drug was usually continued in each case until the temperature had been normal for one week.

General supportive treatment of the highest possible quality was given all patients The following regimen was carried out at the 20th General Hospital Patients were placed in an air conditioned ward and had absolute bed rest A high protein, high caloric soft diet with supplementary vitamins and 4 Gm of added salt was provided If the patient was too ill to take the diet properly, Amigen [7] and glucose were given intravenously The fluid intake was maintained at 3 to 4 liters daily and the urine output was measured Oxygen was administered for dyspnea or cyanosis Blood transfusions and plasma were given for impending shock Paraldehyde was the drug of choice for extreme restlessness, and codeine for pain Bacterial complications were treated with penicillin Sulfonamides were considered contraindicated because of their antagonistic reaction to para-aminobenzoic acid

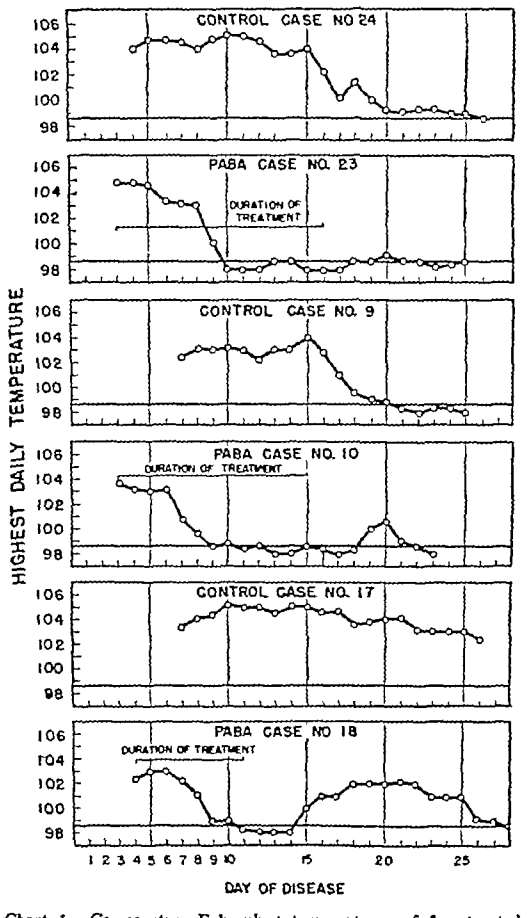

Chart 1.—Comparative Fahrenheit temperatures of 3 untreated control cases of scrub typhus and 3 cases treated with para-aminobenzoic acid (PABA) Duration of treatment is indicated in the charts

At the Indian General Hospital most of the preceding supportive measures were executed, with the exception of the air conditioning and the use of Amigen

## THE DETERMINATION OF PARA-AMINOBENZOIC ACID IN THE BLOOD

The method used for determining para-aminobenzoic acid in the blood was the same as that described by Marshall and Litchfield [8] for sulfanilamide with the

8 Marshall E T and Litchfield J T The Determination of Sulfanilamide Science 88 85-86 1938

exception that a standard solution of para-aminobenzoic acid was substituted for sulfanilamide For the blood levels in this series, a standard solution of para-aminobenzoic acid containing 30 mg of para-aminobenzoic acid per hundred cubic centimeters was found satisfactory In preparing the standard, the sodium salt of para-aminobenzoic acid was used because of its solubility

RESULTS

In this series there were 34 patients with definitely proved uncomplicated tsutsugamushi disease Of the 34, 16 were Americans, 16 Indians and 2 Chinese Twenty-six of them (76 per cent) had classic tsutsugamushi disease, which consisted of a typical history and physical findings, including the eschar Five patients had neither rash nor eschar, while 3 had rashes but no eschars, but these patients had all the other signs and symptoms of this disease including a confirmatory proteus OXK titer rise One patient a man aged 35, had malignant tertian malaria as well as classic tsutsugamushi disease Treatment with quinine and atabrine was begun shortly after admission and para-

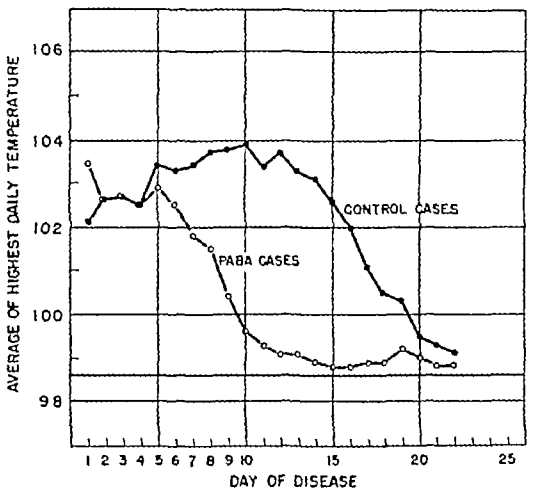

Chart 2 —Comparison of the average of the highest Fahrenheit temperature each day in 16 untreated control cases of scrub typhus and in 18 cases treated with para aminobenzoic acid (PABA)

aminobenzoic acid was started at the end of the sixth day of the disease There was no apparent response to therapy except for the disappearance of the malarial parasites from the peripheral blood smear after three days In spite of para-aminobenzoic blood levels that ranged between 20 and 40 mg per hundred cubic centimeters his condition became worse He developed an extensive bronchopneumonia and died on the fifteenth day of the acute illness This patient had all the clinical signs of tsutsugamushi disease, including a characteristic eschar The proteus OXK titer rose from 1 40 to 1 640 It appeared clinically that the cause of this patient's death was tsutsugamushi disease, but the microscopic examination failed to reveal any lesions characteristic of tsutsugamushi disease Smears of the brain and spleen were negative for malarial parasites The pathologic diagnosis was a bacterial bronchopneumonia Because of the complicated nature of this case, which prevented clear appraisal of the effect of treatment with para-aminobenzoic acid, the case is not included in the following statistics

*Effect of Para-Aminobenzoic Acid on Temperature* —The favorable response to para-aminobenzoic acid therapy seemed to be apparent After approximately two days of treatment the temperature started to fall by lysis, and after five to seven days it was normal in the majority of cases Although the change was striking in most of the individual cases, it was most impressive when one compared it to that seen in the untreated alternate controls (chart 1) The overall difference in the temperature courses is brought out by comparing the average of the highest temperature each day in all of the para-aminobenzoic acid cases to that in the controls (chart 2) There were ten more days of fever in the average of the control cases than in the average of the para-aminobenzoic acid cases

In case 27 (table 1) the temperature was coming down until the patient developed a nonspecific diarrhea which lasted for a week, and with this there was an exacerbation of his fever In cases 10 and 18 (fig 1) and 29 (table 1) after the para-aminobenzoic acid was discontinued there was a secondary rise in temperature Associated with this there was a mild recurrence of the previous symptoms, and, what was most impressive, the lymph nodes became enlarged again Despite a thorough search for complications to account for this secondary temperature rise, none were found The fever lasted from three to fourteen days, but the patients were not very ill and the para-aminobenzoic acid was not started again This secondary fever had all the characteristics of typhus and it was interpreted as a mild relapse It did not occur in the untreated cases of scrub typhus This also was noted by Yeomans and his associates[4] in louse borne typhus treated with para-aminobenzoic acid but not in the untreated cases

*Effect of Para-Aminobenzoic Acid on the General Symptoms* —Patients with severe tsutsugamushi disease appear toxic and apathetic, and they usually complain of a very disturbing headache The average duration of these symptoms is approximately two weeks, but in those who received para-aminobenzoic acid therapy there was an early change After two to three days the headache was either gone or much less severe, the patient was much more alert, and in a number of cases the appetite had returned These are observations which impressed every one who had close contact with the patients It was quite apparent that the disease process was altered, particularly when one compared it to that in the controls

Some of the most striking responses to therapy occurred in those patients who had a very high concentration of para-aminobenzoic acid (95 to 150 mg per hundred cubic centimeters) In 2 of these patients the pronounced generalized lymphadenopathy disappeared within three days (cases 10 and 12, table 1) In spite of the very high drug levels, the only toxic manifestation was slight confusion One patient (20) had two convulsions when he had a para-aminobenzoic acid blood level of 103 mg per hundred cubic centimeters, but at that time he was acutely ill and the convulsions were probably due to the disease rather than to the drug

*Effect of Para-Aminobenzoic Acid in Decreasing the Complicating Conditions* —In the 16 control cases there was severe bronchitis in 14 and mild bronchitis in 1, while in the 18 para-aminobenzoic acid cases there was bronchitis in only 4, and this was mild and of very short duration There was severe pneumonitis in 10 control cases but none in the para-aminobenzoic acid cases Severe delirium occurred in 4 control cases and in 1 para-aminobenzoic acid case Mild delirium occurred in 2 patients who had high para-aminobenzoic acid blood levels Stupor occurred in 4 controls and

in 1 para-aminobenzoic acid case, while coma was present in only 3 controls Convulsions were observed in only 1 case, and that was a para-aminobenzoic acid case

Two control patients had definitely abnormal electrocardiograms, with low voltage and inverted T waves, and 1 of these patients had a gallop rhythm One control patient developed a prothrombin level of 30 per cent of normal and had numerous subcutaneous hemorrhages Painful, persistent peripheral neuritis occurred in only 3 control cases, and partial deafness which lasted for several weeks in 2 control cases Bacterial complications occurred in only 2 para-aminobenzoic acid cases, 1 of these patients developed a parotitis, while the other had a recurrence of otitis media, but both of them

The difference between the degree of overall severity in the patients who received para-aminobenzoic acid and those who did not was striking The great majority of those receiving para-aminobenzoic acid had mild courses There were no deaths, and only 1 patient became gravely ill Of the patients who did not receive para-aminobenzoic acid 3 died and 7 were gravely ill The classification of the whole series according to the method just described is shown in table 2

*Effect of Para-Aminobenzoic Acid in Shortening the Period Needed for Convalescence*—There was a great difference in the general condition of the patients in the para-aminobenzoic acid series and in the control series during the period of convalescence As one

Patients 1 to 16 Indians 21 and 22 Chinese 17 to 20 and 23 to 34 Americans † Mg per 100 Cc PABA = para aminobenzoic acid

responded to penicillin therapy The foregoing data are presented in the general summary in table 1

An attempt was made to classify these cases according to the degree of severity in the following manner mild, moderate, severe, grave fatal The case was classified only when it was completed Duration of fever, duration and degree of toxicity and amount of pulmonary, cerebral or cardiac involvement were some of the factors considered If the patient's life was in jeopardy his case was called grave That is only those patients placed on the seriously ill list were classified as grave cases Many of the patients classified as being mildly ill appeared very toxic and severely ill on admission, but owing to their prompt response to treatment with a short febrile course and failure to develop severe complicating conditions they were placed in this category With this plan in mind an unprejudiced attempt was made to relate the degree of severity of the case with the treatment received

would expect, it conformed to the degree of severity of the disease The majority of the patients who received para-aminobenzoic acid required a much shorter period of convalescence than the control cases

TABLE 2—*The Ultimate Severity of the Disease With and Without Para-Aminobenzoic Acid Therapy*

| | Mild | Moderate | Severe | Grave | Fatal |
|---|---|---|---|---|---|
| Para aminobenzoic acid cases | 1[illegible] | 5 | 0 | 1 | 0 |
| Control cases | 1 | 1 | 4 | 7 | 3 |

*Effect of Para-Aminobenzoic Acid on the White Blood Cell Count*—It was noted by Yeomans and his associates [4] that there was a tendency for the total white blood cell count to drop during para-aminobenzoic acid treatment, but no change was observed in the differential count In the patients with tsutsugamushi

disease receiving para-aminobenzoic acid therapy 2 developed white blood cell counts below 3,000 per cubic millimeter. One of these patients had a count of 1,500 with 18 per cent granulocytes, the other a count of 2,200 with 8 per cent granulocytes. A third patient had a white blood cell count of 3,600 with 20 per cent granulocytes, and a fourth patient had a 4,050 white cell blood count with 20 per cent granulocytes. This leukopenia developed at the end of the course of treatment. As a result, in no case was it necessary to discontinue the drug during the acute stage of the disease, and in no case was there a relationship noted between the para-aminobenzoic acid blood level and the degree of leukopenia. In all these patients the white blood cell count started to rise within four to five days after the para-aminobenzoic acid was stopped. The regeneration in the lymphocytes preceded that in the granulocytes by three to four days. At the time of discharge the white blood cell counts were normal in all the cases. No change was noted in the red blood cell count at any time which could be attributed to para-aminobenzoic acid.

### IMPORTANCE OF EARLY TREATMENT

Treatment with para-aminobenzoic acid was instituted in these cases not later than the end of the seventh day of disease. It is obvious that the earlier the treatment is begun the better, but it is not known just how late para-aminobenzoic acid may be started and still be effective. It should be worth trying even though it may be late in the case.

### THE OPTIMUM AMOUNT OF PARA-AMINOBENZOIC ACID THERAPY

The high blood concentrations of para-aminobenzoic acid appeared to have a more abrupt therapeutic effect than the lower ones, but they also caused slight delirium. The patients who had para-aminobenzoic acid levels between 30 and 60 mg. per hundred cubic centimeters improved almost as quickly and had no mental reactions, so it seemed preferable to maintain the blood concentration of para-aminobenzoic acid within that range. After the patient became afebrile, the para-aminobenzoic acid concentration was frequently reduced to 10 to 20 mg. per hundred cubic centimeters without any relapse taking place.

Para-aminobenzoic acid was continued for a week after the temperature had been normal in an attempt to eliminate the secondary temperature rise. This procedure was started after the prolonged secondary fever occurred in case 18. Despite this there was a nine day secondary fever in case 29, but there was no prolonged secondary temperature rise in any of the other cases. If the drug is well tolerated by the patient, it is probably wise to continue the treatment in the manner just mentioned even though it may not be necessary.

### PRECAUTIONS TO BE TAKEN DURING PARA-AMINOBENZOIC ACID THERAPY

Although no serious toxic reactions have been attributed to para-aminobenzoic acid, one cannot be careless in its use. The total white blood cell count should be determined at least every second day, and if it is below 4,000 a differential count should be done. If the percentage of granulocytes is below 30, discontinuation of the drug should be strongly considered. A total white blood cell count which has fallen below 3,000 during treatment is also a good indication for discontinuing para-aminobenzoic acid.

A complete blood count should be carried out weekly and frequent urine examinations should be made. The fluid intake and output should be followed and regulated properly and the urine kept alkaline. The para-aminobenzoic acid blood concentration should be followed closely, and if it is above 60 mg. per hundred cubic centimeters the omission of a dose and the reduction of the maintenance dose should bring about the proper correction.

### COMMENT

By considering the severity of the disease in the control cases in which the case fatality rate was 19 per cent, it was apparent that in general, we were dealing with very severe tsutsugamushi. Many of the para-aminobenzoic acid patients were very toxic toward the end of the first week of the disease when treatment was being started. If the disease ran the usual course, as was seen in the controls, one would have expected them to have become more severely ill during the second week, as the second week is usually the worst in tsutsugamushi disease. This did not happen. Instead of the disease growing worse, there was improvement. After two to three days the temperature started to fall by lysis and there was definite symptomatic improvement. In 2 patients we observed the disappearance of a pronounced lymphadenopathy after three days of para-aminobenzoic acid therapy. There were few complicating conditions in the para-aminobenzoic acid cases and many in the controls. The usual course of disease seemed to be definitely altered and made much milder by para-aminobenzoic acid.

The secondary temperature rise which occurred in 3 patients after para-aminobenzoic acid had been discontinued was associated with a recurrence of the generalized lymphadenopathy and a return of some of the original symptoms. It resembled mild tsutsugamushi disease and, since nothing else could be found to account for it, we regarded it as a mild relapse. As it occurred after the para-aminobenzoic acid had been discontinued, and after the patient had been afebrile for several days (except in case 29), it seemed to be added evidence that para-aminobenzoic acid had had a definite suppressive action on the tsutsugamushi disease. These patients probably were not able to develop sufficient immunity to the disease to prevent a relapse after para-aminobenzoic acid was discontinued.

Although the number of cases treated in this series is not large, the results indicate that para-aminobenzoic acid has been decidedly effective and should be used in all cases of tsutsugamushi disease.

Since all the rickettsial diseases conform to the same basic pattern, it is not unlikely that para-aminobenzoic acid may prove to be a general antirickettsial agent. The work of Anigstein and Bader[9] showing that para-aminobenzoic acid had a protective action on guinea pigs inoculated with spotted fever, and the report by Rose and his associates[10] on the clinical case of spotted fever treated with para-aminobenzoic acid suggest that the drug may be effective against this disease also. Thus para-aminobenzoic acid appears to be widening the field of chemotherapy by attacking a new group of diseases for which there has been no cure.

9. Anigstein, L. and Bader, M. N.: Para-Aminobenzoic Acid—Its Effectiveness in Spotted Fever in Guinea Pigs, Science **101**: 591-592, 1945.

10. Rose, H. M., Duane, R. B. and Fischel, E. E.: The Treatment of Spotted Fever with Para-Aminobenzoic Acid, J. A. M. A. **129**: 1160-1161 (Dec. 22) 1945.

SUMMARY

1 Eighteen patients with tsutsugamushi disease were treated with large doses of para-aminobenzoic acid, and their clinical courses were compared to 16 alternate controls who received the standard treatment

2 The difference between the course of the disease in the para-aminobenzoic acid cases and the controls was striking The patients who were given para-aminobenzoic acid had fewer days of fever, less severe symptoms and complicating conditions, a shorter period of convalescence and a lower case fatality rate

3 It is concluded that para-aminobenzoic acid administered in the first week of disease is an effective therapeutic agent against tsutsugamushi disease -

# Clinical Notes, Suggestions and New Instruments

## THE USE OF NEOSTIGMINE IN THE TREATMENT OF THE GUILLAIN BARRÉ SYNDROME

J ORDIE SHAFFER M D
Minneapolis

The Guillain-Barre syndrome has recently received increasing attention and is more frequently being differentiated as a distinct entity from similar conditions such as poliomyelitis The use of neostigmine by Kabat and Knapp [1] in the treatment of poliomyelitis prompted the use of neostigmine in this case of the Guillain-Barre syndrome.

Neostigmine methylsulfate (1 2,000 solution) was given hypodermically in dosages varying from 2 to 8 cc daily, with an average of 5 to 6 cc. being given in divided doses of 1 to 2 cc. (0.5 to 1 mg) at two to three hour intervals The action occurs rapidly, so that within fifteen minutes muscle spasm and incoordination are measurably reduced. The decrease in "proprioceptive reflex hyperirritability' enables a wider range of passive motion, as shown by the Kernig test, and the decrease in 'skeletal muscle hypertonus" permits the patient a wider range of active motion [1] The therapy also enables a more coordinated active movement. Atropine sulfate was given in a dosage of 1/300 to 1/150 grain (0.2 to 0 1 mg) intermittently in the beginning of the therapy with the purpose of offsetting any possible undesirable effects of the neostigmine. No change in the efficacy of the neostigmine therapy was produced by the atropine, but no undesirable side actions were observed from the neostigmine after the atropine was discontinued The former tends to confirm Kabat and Knapp's belief that the action of neostigmine depends on the alteration of function of synapses in the spinal cord rather than in the myoneural junction [1]

Although Guillain felt that this disease was always benign,[2] there is ample evidence in the literature now that this is not the case. Various authors have reported mortality rates of from 8 to 30 per cent in their series, and late residual complications have been reported in as high as 31 per cent (5 cases) of a small series of 16 cases with one death in the same series of Taylor and McDonald [3] Bradford, Bashford and Wilson [4] reported 8 deaths in 30 cases (26 per cent) and Gilpin, Moersch and Kernohan [5] recorded a 20 per cent mortality rate in their series while Baker [6] reported a 10 per cent mortality rate (3 cases) in his series of 33 cases These facts all tend to encourage one to use an active course of therapy rather than a course of expectant observation with only supportive therapy, and it is hoped that the present proposed neostigmine therapy will fulfil this aim

REPORT OF CASE

*History*—T S, a white boy aged 8 years, had enjoyed good health except for chickenpox and whooping cough, which were experienced without residuals at 6 years of age. The child's parents and 2 older siblings also were healthy The remainder of the past history was noncontributory

*Present Illness*—The child's first difficulty developed on Feb 14, 1944, when a symmetrical paresis of the legs began This slowly increased in severity and progressed upward during the next three days, finally involving his back and arm muscles Concomitantly with this he had paresthesias and radicular pains in his legs On February 18 he developed a severe headache and the muscular involvement spread to the neck and the muscles of deglutition, causing difficulty in swallowing The paresis progressed into a complete paralysis until on February 23 he was totally paralyzed except for the muscles of facial expression and some slight rotatory movement of the neck In spite of the severe symptomatology there were no mental symptoms or findings suggestive of a septic process On February 23 the patient was admitted to the Philadelphia Hospital for Contagious Diseases as a case of possible poliomyelitis

*Physical Examination*—On admission the child appeared asthenic and weighed 70 pounds (32 Kg) His temperature was 98 6 F, the pulse rate was 80 and the respiratory rate was 18 Complete paralysis was present except as mentioned. There was a generalized depression of all reflexes The abdominal reflexes and the knee and ankle jerks were completely absent bilaterally Both the Kernig and Brudzinski tests were positive bilaterally The inability to swallow or extrude saliva caused frequent accumulation of saliva in the patient s throat, which made oral suctioning necessary Urinary and bowel incontinence were also present. The remainder of the physical examination was negative

*Laboratory Examination*—Data on admission and subsequent determinations are listed in the accompanying table.

A spinal tap revealed the acellular hyperalbuminosis or cell protein dissociation in the spinal fluid characteristic of the Guillain-Barre syndrome The protein was elevated to 365 mg per hundred cubic centimeters whereas the cell count was within normal limits (3 lymphocytes per cubic millimeter) Both blood and spinal fluid cultures were sterile

The treatment consisted in intravenous glucose feedings and supplemental doses of thiamine hydrochloride daily The patient improved slowly, and by February 28 he was able to swallow again but continued to have pain and paresthesias of itching and tingling in his legs On February 29 he was able to move his arms and legs a slight amount in a very slow incoordinate manner Improvement occurred during the next three days in the control of his hands and arms, and he was able to lift his head up slightly on March 4 Severe pain in the muscles of his legs continued, and at times he cried out in pain On March 6 he was transferred to the Philadelphia General Hospital

On admission he was afebrile but his pulse was 120 per minute and respirations were 22 per minute Neurologic examination revealed that his eyes were normal aside from slight lateral nystagmus The base of the uvula deviated slightly to the right on elevation A slight rigidity of the neck was present. Alleviation of the paralysis was occurring with most pronounced recovery in the cephalid portion of the body, where slight movements of the hands and arms were possible, although poorly coordinated Slight flexion and extension of the thighs were possible, but movement of the lower legs was almost imperceptible (— 3), abdominals and cremasteric reflexes were present, but knee and ankle jerks were absent. Babinski tests were normal Deep muscle and tendon pain were increased in all extremities, but sense position was normal The Kernig sign was positive bilaterally with a motion of

55 degrees possible on the left and 45 degrees on the right The spinal tap revealed water clear cerebrospinal fluid Pressure was not measured but appeared to be low Cell protein dissociation was still present with 10 lymphocytes per cubic millimeter and a protein determination of 436 mg per hundred cubic centimeters Supportive treatment including a high vitamin diet was continued The degree of active and passive motion possible in the joints of the lower extremity was tested periodically, but only slight improvement occurred, so that on March 11 neostigmine therapy was started on the patient.

Neostigmine methylsulfate (1 2,000) was given hypodermically at two to three hour intervals, and the tests on the degree of active and passive motion possible were continued. Atropine sulfate was given concomitantly at first to offset any possible reactions such as abdominal cramps or bradycardia, but later it was discontinued, as already mentioned Measurements of the degree of motion were done by means of a goniometer in which the error in measurement is about 2 5 degrees The measurements of passive motion of the knee joints were done by using the Kernig test with the patient in the supine position, and the thigh as nearly perpendicular to the body as possible.

The lower part of the leg was moved in an arc until pain was first elicited and measurement of passive motion was taken at this point. The greatest mean daily improvement over a five day period on supportive therapy was only 18 degrees, as shown in chart 1 One single injection of neostigmine caused a mean improvement of 50 degrees, representing more improvement in two hours than he had shown in the five days previously Measurements of active motion were done on each of the three major joints of the lower extremity The tests on the ankle were done with the knee placed in partial flexion. Chart 2 demonstrates the rapid improvement in active motion which occurred after the start of neostigmine therapy on March 11, as contrasted to the previous period The improvement in coordination similarly paralleled the improvement in motion

With rapid improvement on neostigmine therapy the patient was able to be up in a walker by March 16, moving his legs as he was pushed along Three days later, on March 19, he was able to move well with his own power On March 25 he walked short distances with aid and on the following day walked alone. Further improvement continued, and before his discharge from the hospital on April 19, 1944 he was able to run rapidly with no discernible difference from a normal child except that he fatigued more easily The child's endurance further improved but was not entirely equal to that prior to his illness until six months after his hospital discharge. He also continued to have a slight generalized depression of all his reflexes until October 1944, by which time all returned to within normal limits He was rechecked again in November 1945 (nineteen months after hospital discharge) and was found to be neurologically normal with no discernible evidence of residual abnormality such as muscle spasm or atrophy He has no difficulties of any kind at present and is in excellent health.

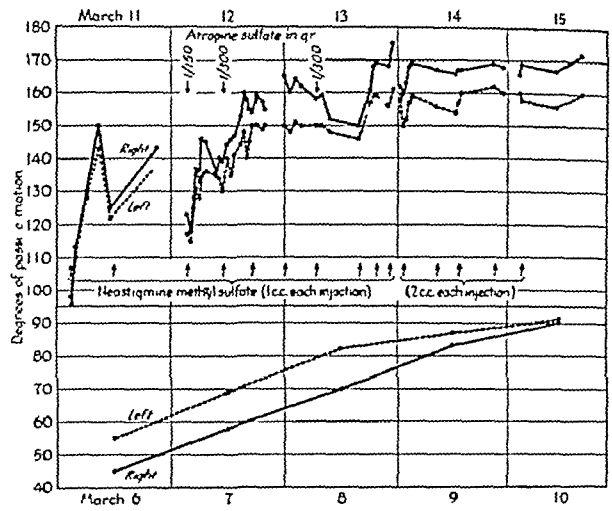

Chart 1 —Degrees of passive motion possible in knees as evidenced by the Kernig test over five day periods before and after neostigmine therapy

## SUMMARY AND CONCLUSIONS

1 Neostigmine, when used in the treatment of a case of the Guillain-Barre syndrome of the myelitic type, significantly increased both the active and passive range of motion and decreased the incoordination of movement.

2 The suggested dosage of neostigmine methylsulfate (1 2000 concentration) for a 70 to 75 pound (32 to 34 Kg ) person is 2 cc. given hypodermically every three hours for three to four doses daily, to be continued until the maximum expected improvement has occurred Atropine sulfate 1/300 grain (0.2 mg ) may be given concomitantly with the neostigmine to offset

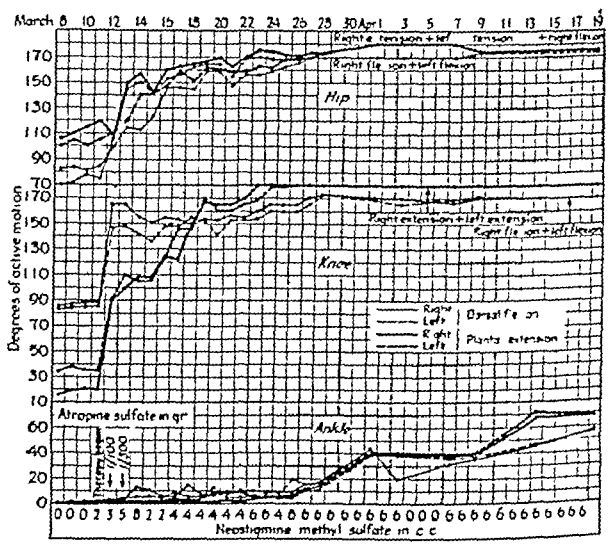

Chart 2 —Degrees of active motion possible in the joints of the lower extremities.

any undesirable effects and later given intermittently or discontinued at the clinician's discretion

3 It is hoped that this initial report on the use of neostigmine in the therapy of the Guillain-Barre syndrome will act as an impetus to clinicians to study further and continue this active method of therapy in order to reduce the mortality rate and morbidity rate of late complications in this syndrome.

# Council on Pharmacy and Chemistry

## REPORT OF THE COUNCIL

*The Council has authorized publication of the following statement* AUSTIN SMITH, M D, *Secretary*

## POTENCIES OF VITAMIN A PREPARATIONS ACCEPTED BY THE COUNCIL

From time to time the Council office has received inquiries from manufacturers as to the acceptability of vitamin A preparations in dosages of potency ranging from 50 000 units to 150,000 units or more. The Council has previously accepted no dosage of potency higher than 25,000 units The Council believes that this policy should be continued In reaching this conclusion, the Council is not concerned with toxic effects of vitamin A from the administration of capsules of higher potency This view is based on the fact that to encourage the use of very large doses of vitamin A would not be in the interest of good medical practice If those interested in doing investigational work desire to experiment with daily dosages of the order of 50,000 to 150,000 or more units they may use multiples of a 25,000 unit dosage. The Council finds no justification for routine administration of doses in excess of 25,000 units per day

## NEW AND NONOFFICIAL REMEDIES

*The following articles have been accepted as conforming to the rules of the Council on Pharmacy and Chemistry of the American Medical Association for admission to New and Nonofficial Remedies A copy of the rules on which the Council bases its action will be sent on application*

AUSTIN SMITH, M D, *Secretary*

**THROMBIN, TOPICAL**—Thrombin—A preparation of thrombin, isolated from bovine plasma It complies with the requirements of the National Institute of Health of the United States Public Health Service.

*Actions and Uses*—Thrombin is intended as a hemostatic for topical application to control capillary bleeding in operative procedures It may be applied as a dry powder or dissolved in sterile, isotonic saline solution *It should never be injected*

*Dosage*—As a dry powder or in solutions containing 1,000 to 2,000 thrombin units

*Preparation and Tests*—

Thrombin may be prepared by the method of Seegers et al (*J Biol Chem* **146** 511 1942) Oxalated bovine plasma is diluted fifteen fold with water and acidified with acetic acid to a *ph* of about 5 1 to obtain a prothrombin concentrate by isoelectric precipitation This precipitate is suspended in oxalated saline solution dissolved by the addition of tenth normal sodium hydroxide to *ph* of about 6 4 and the prothrombin is adsorbed on a magnesium hydroxide cream The prothrombin is eluted by decomposing the magnesium hydroxide with carbon dioxide and the magnesium salts are then removed by crystallization filtration and dialysis The purified prothrombin is again concentrated by isoelectric precipitation and is then redissolved in isotonic saline solution Optimum amounts of calcium nitrate and lung extract are added The resulting concentrated solution of thrombin is sterilized by suitable filtration standardized for potency placed in ampuls and dried

The lung extract used in the preparation of thrombin is prepared from fresh ground bovine lung tissue

Thrombin topical is standardized to possess at least 10 units of thrombin per milligram of total solids The unit of thrombin has the power to clot 1 0 cc. of fibrinogen solution in $15 \pm 0.5$ seconds at $28 \pm 1$ C when tested by the method described by the National Institute of Health

Thrombin topical a mixture of thrombin and sucrose is a white powder completely soluble in water or isotonic solution of sodium chloride It contains not more than 1 mg of protein nitrogen per 300 units of thrombin When dried over phosphorus pentoxide under vacuum for forty-eight hours at room temperature the loss in weight is not greater than 1 per cent The ash content of thrombin topical, is not more than 5 mg per thousand units of thrombin When heated in an oven at 50 C for two weeks, thrombin topical shows no loss in activity

PARKE, DAVIS & CO, DETROIT

**Thrombin (Bovine) Topical** 5,000 units Each ampul contains 5,000 units of thrombin packaged with a 5 cc. vial of sterile isotonic saline solution preserved with phemerol 1 50,000

**PROCAINE HYDROCHLORIDE** (See New and Nonofficial Remedies, 1945, p 97)

The following additional dosage form has been accepted

WINTHROP CHEMICAL CO, INC, NEW YORK

**Novocain Solution 2 per cent** 30 cc bottles Each cubic centimeter contains procaine hydrochloride 20 mg, sodium chloride 3 5 mg, sodium bisulfite 2 mg and chlorobutanol 2 5 mg as a preservative

**PENICILLIN** (See New and Nonofficial Remedies, 1945, p 214)

The following dosage form has been accepted

PREMO PHARMACEUTICAL LABORATORIES, INC, NEW YORK

**Penicillin Sodium** Vials containing 100,000 Oxford units

# Council on Physical Medicine

*The Council on Physical Medicine has authorized publication of the following report* HOWARD A CARTER *Secretary*

## EYE DISCOMFORT CAUSED BY IMPROPERLY SHIELDED BLACK LIGHT ULTRAVIOLET LAMPS

The fluorescence excited by filtered ultraviolet radiation is finding a wide variety of uses by amateurs and by professional workers in examining minerals, documents and other objects, also in the examination and diagnosis and as a guide in the treatment of ringworm infection of the scalp The source of ultraviolet rays is a high vapor pressure, 'hot," mercury arc lamp In the commercial so-called "black light' lamps the filter enclosure consists of a red purple glass that transmits principally the powerful emission line of wavelength 3 663 angstroms (often written 3,650 A) and a small amount of the less intense visible (violet) emission line of wavelength 4,055 angstroms Depending on the manner of operation of the lamp (especially the high powered, 250 watt lamps) both of these lines excite a hazy bluish white fluorescence ('fog") in the eye media that interferes with clear vision and fatigues the eye, causing discomfort and sometimes headache if the examination is too prolonged But apparently no permanent damage ensues

Goggles suitable to wear when working under high powered black light lamps should be made of glass that absorbs completely the emission line of wavelength 3 663 angstroms and preferably also (at least 90 per cent of) the line of wavelength 4,055 angstroms To insure good visibility of the ringworm infected parts (for example the minute, fluorescing dots where hairs have fractured at the surface of the skin) such a glass should transmit not less than 85 per cent of the bluish to greenish fluorescent radiation (5,200 to 5,800 angstroms) emitted under 'black light" irradiation Such a glass may have a faintly yellowish tint, and any colloidal matter in the glass should not emit a strong fluorescence

In the preliminary tests, using promising glasses the samples of "Cruxite-A" transmitted too much 'black light,' and the colloidal matter in the samples of "Noviol O and A" fluoresced too much to view objects clearly through them. An uncolored glass containing sufficient cerium oxide to absorb completely the 3 663 angstrom line and samples of 'gold plate" met all the requirements

Evidently the remedy is to place the lamp in a suitable housing and to wear suitable goggles when making prolonged examination of objects excited to fluorescence by means of high powered "black light" ultraviolet lamps However it would be unfortunate if this information should be seized on for the sales promotion of sun glasses for outdoors wear

Looking directly at the sun through a blue-purple glass (Corning 986, which transmitted some 70 per cent of all wavelengths from 2,900 to 3,700 angstroms) showed no appreciable fluorescence of the eye media, such as is produced by the 3,663 angstrom emission line of the high powered "black light" lamps Hence there appears to be no need of wearing special sun glasses to eliminate these rays in sunlight

SATURDAY, MAY 25, 1946

## THE SAN FRANCISCO SESSION

After a lapse of several years the first complete annual session of the American Medical Association since 1942 is to be held in San Francisco, Calif, during the week of July 1 to 5 In this issue of The Journal appear the call for the meeting, pertinent data regarding the convention city and the arrangements, the programs of the general scientific meetings, the scientific sections, the Scientific Exhibit, the motion pictures and the Technical Exhibits Together they constitute one of the greatest postgraduate assemblies available under the auspices of any medical organization

Already the reservations that have been made with the subcommittee on hotels indicate a capacity attendance The local committee on arrangements, which includes most of the leaders of medicine in San Francisco, are doing everything possible to assure comfort and convenience for all those who attend Many of the leading medical fraternities and medical schools are planning special reunions of their members and alumni during the session The Woman's Auxiliary has outlined a program which will give its members opportunity to participate not only in the advancement of the organization but also in many social, sight-seeing and similar functions The American Medical Golfing Association, after a lapse of several years will now hold its thirtieth tournament at the Olympic Club, which offers one of the finest golf courses in America

Attention is called particularly to the special exhibit on physical medicine including rehabilitation, to the magnificent demonstrations by the U S Army and Navy medical corps of their work and to the comprehensive program of motion pictures which will be available in six motion picture theaters operating continuously throughout the week

Significant of the contribution to postgraduate medical education made by the annual session are the General Scientific Meetings, which occupy most of the first two days of the session Special credit for arranging one of the most comprehensive, up to date and interesting programs in the history of these meetings must be given to Dr Edward L Bortz of Philadelphia, who made this a special project His experience in conducting the Wartime Medical Assemblies served him well in securing the cooperation of many investigators and teachers of demonstrated ability in presenting their subjects

At the San Francisco session also will be inaugurated for the first time meetings of the new Section on General Practice of Medicine This program is designed particularly for the general practitioners who are brought into contact at the annual session of the American Medical Association with progress made in the various specialties

The House of Delegates will be concerned at the San Francisco session with many of the problems that continue from previous meetings as well as some phases of medical legislation that have developed since the meeting in December 1945 The progress of the Association in developing Associated Medical Care Plans, Inc, the recommendations of President Truman for consolidation of federal agencies interested in health and the current versions of the Wagner-Murray-Dingell and the Taft-Smith-Ball bills are of special interest to the House of Delegates The progress made by the various states in meeting the requirements of the Veterans Administration for medical care to veterans is also likely to have consideration

Because of the tremendous demand on space available in The Journal for material related to the annual session some of the departments that appear regularly in The Journal are condensed and others have been eliminated The hearings before the Committee on Education and Labor of the U S Senate will be continued in forthcoming issues of The Journal until their completion The strike of the coal miners, the threatened strike of railroad employees and difficulties in securing personnel in the printing establishment of the Association have raised serious problems of publication Our readers will, we hope, bear with us in the emergency

## PRESIDENT TRUMAN REVAMPS THE FEDERAL SECURITY AGENCY

On May 16 President Harry S Truman transmitted to the Congress of the United States a reorganization plan for federal agencies which concerns particularly those in the fields of education, health and welfare In transmitting his plan to the Congress, President Truman pointed out that conservation and development of the human resources of the nation under our system of government is a joint responsibility of the federal, state and local governments "Through its research, advice, stimulation and financial aid," said President Truman, "the federal government contributes greatly to progress and to the equalization of standards in the fields of education, health and welfare"

"The Federal Security Agency has as its basic purpose the conservation and development of the human resources of the nation Therefore child care and development, education, health, social insurance, welfare—in the sense of care of the needy and the defective —and recreation are its special functions" President Truman indicated, for example, that the development of day care centers for children involved joint planning and service by specialists of the Children's Bureau, the Office of Education, the Public Health Service and several other agencies "As a step in producing coordination, increasing efficiency, reducing expenditures and eliminating overlapping and duplication of effort" the President transferred to the Federal Security Administrator the functions of the Children's Bureau "except those relating to child labor under the Fair Labor Standards Act" In proposing this transfer the President pointed out that state welfare departments now depend on both the Bureau of Public Assistance in the Federal Security Agency and the Children's Bureau in the Labor Department for funds in child care activity Similarly the state health departments obtain grants from the Public Health Service for general public health work and from the Children's Bureau for child and maternal health activities Unless the plan is rejected by the Congress within sixty days, President Truman by taking this action has made effective a recommendation which has been made by the House of Delegates of the American Medical Association for a good many years Incidentally the hearings before the Senate Committee on Education and Labor now going on in Washington have also brought out the great desirability of the step now taken by the President

The reorganization plan of the President also involved transfer of the vital statistics functions of the Census Bureau to the Federal Security Administrator In making this transfer the President pointed out that in every state but one the state health department is in charge of vital statistics

President Truman points out that the reorganization plan which created the Federal Security Agency in 1939 "provided that the Federal Security Administrator should direct and supervise the Social Security Board and that he might assign administrative duties to the chairman of the board rather than to the boards as a whole" The President believes that "a full time board in charge of a group of bureaus in an agency is, at best, an anomaly" In order to obtain more expeditious and effective direction for the Social Security program and to further the development of the Federal Security Agency, the President transferred the functions of the Social Security Board to the Federal Security Administrator and provided for not more than two new assistant heads of the agency for the administration of the program The exact significance of this action is not clear It does, however, eliminate the Social Security Board as a directing agency and places the complete responsibility for the conduct of the social security functions directly on the administrator

Finally President Truman says that the time is at hand when the conservation and development of human resources should be the function of an executive department of our federal government

> The size and scope of the Federal Security Agency and the importance of its functions clearly call for departmental status and a permanent place in the President's Cabinet In number of personnel and volume of expenditures the agency exceeds several of the existing departments Much more important, the fundamental character of its functions—education, health welfare, social insurance—and their significance for the future of the country demand for it the highest level of administrative leadership and a voice in the central councils of the Executive Branch
>
> Accordingly, I shall soon recommend to the Congress that legislation be promptly enacted making the Federal Security Agency an executive department, defining its basic purpose and authorizing the President to transfer to it such units and activities as come within that definition

Thus we would seem to be well on the way toward the development of a cabinet position in which medicine and welfare will find representation in the highest councils of the nation Obviously the medical profession will be greatly concerned with the type of leadership chosen by the President for this important position

## THE TAFT-SMITH-BALL NATIONAL HEALTH BILL

Senator Taft of Ohio introduced into the Senate early in May a program for health which was promptly hailed by the press as an opposition measure to the Wagner-Murray-Dingell bill The measure introduced by Senator Taft emphasized the creation of a national health agency under which all health functions of the federal government would be administered This agency would be directed by an administrator for whom the Surgeon General of the United States Public Health Service would substitute when necessary The main portion of the bill would appropriate two hundred million dollars annually for the next five years to be allocated to the individual states in order that they might be encouraged to provide hospital, surgical and medical service for those in need or those able to pay only in part The plans developed in the individual states would require approval by the Surgeon General of the United States Public Health Service, but, on failure to approve, the state agency could appeal to a National Health Council This council would consist of the Surgeon General ex officio as chairman and eight members appointed by the administrator Five of these would be persons well known in the health field, and at least three would be doctors of medicine The other three would be persons familiar with the needs for medical care

Another section of the bill would provide dental health service through allocation to the individual states and would also provide for research, including particularly neuropsychiatric research

Finally the measure would permit government employees to allow deductions from their salaries for participation in health insurance plans

The measure proposed by Senator Taft obviously does not aim at the nationwide inclusiveness of the Wagner-Murray-Dingell bill Neither does it require nationalization of the medical profession From the point of view of a scientific attempt to move forward along the lines of extending medical services, it would not revolutionize medical care The bill is therefore preferable to the measure it opposes

Neither the Board of Trustees of the American Medical Association nor the House of Delegates nor the Council on Medical Service and Public Relations has yet had opportunity to consider in detail various aspects of the Taft-Smith-Ball National Health Bill Elsewhere in this issue THE JOURNAL presents an analysis of the measure by the Bureau of Legal Medicine and Legislation When the bill was introduced it was referred to the Senate Committee on Education and Labor, which is now conducting hearings on the current Wagner-Murray-Dingell bill Perhaps when the Senate committee makes its report it will indicate as well its point of view regarding the Taft proposals Since it is unlikely that final action on any of these measures can occur before the House of Delegates of the American Medical Association meets in San Francisco early in July, the medical profession will probably have ample opportunity during the ensuing months of 1946 to crystallize its opinion on present trends in health legislation

## Current Comment

### NATIONAL EMERGENCY MEDICAL SERVICE

At its last meeting the House of Delegates authorized the Board of Trustees of the American Medical Association to appoint a committee of seven for the purpose of studying the communications received from members who were in the armed forces as well as the suggestions made by them for improvement in the service This committee was authorized to undertake a thorough study of the proper apportionment and utilization of physicians in military and civilian capacities in time of a grave national emergency The resolution directed that the Association undertake a critical study of the duties of medical officers during the war just finished, with particular reference to (1) the actual treatment of the injured and the ill and the prosecution of research projects, (2) rotation of medical assignment and (3) the quasi-medical duties for which technicians and specially trained enlisted personnel could readily replace physicians The Board of Trustees has appointed a committee on national emergency medical service and instructed it to undertake the study as described in the action of the House of Delegates This committee is a fact finding board and will offer its studies and recommendations to the House of Delegates from time to time Since its creation the committee has had two meetings an organization meeting at which a general program for studying the problem was outlined and recently, a conference with the Surgeons General and a representative of the Veterans Administration The committee has drawn up a questionnaire, a thousand copies of which have been sent out for the purpose of a pilot survey Medical officers of the reserve corps are asked to give frank expressions of opinion of their assignment and the work which they carried on and other duties which they performed while in military service At a later date a more comprehensive questionnaire will be drawn up and sent to all medical officers who were in military service during the war Each state medical society has been requested by the Board of Trustees to appoint appropriate state committees for the prosecution of studies in their areas Furthermore, appropriate subcommittees will be formed from time to time The committee will make a progress report to the House of Delegates at its next meeting in July

### FOLIC ACID THERAPY

Successful treatment of macrocytic anemia of infancy with synthetic folic acid (Lactobacillus casei factor) has been accomplished by Zuelzer and his associates[1] of the Children's Hospital, Detroit The genesis of this anemia is still obscure All 4 patients treated by Zuelzer were infants from 2 to 12 months of age who had received good diets supplemented by cod liver oil and orange juice in adequate amounts All had a short history of vomiting, anorexia and pallor preceded by signs of upper respiratory infection and fever Three had a mild diarrhea The significant symptom was pallor, usually with slight cardiac enlargement and a soft systolic murmur The spleen was moderately enlarged and firm Blood examinations revealed severe macrocytic anemia accompanied by moderate to severe diminution in blood platelet counts A few nucleated red blood cells were demonstrable in blood smears The bone marrow was characterized by a megaloblastic type of erythropoiesis and changes in the granulocytes resembling those in pernicious anemia Five mg of folic acid concentrate was given daily by mouth The response to this therapy was in all cases a rise in the reticulocyte count on the third and fourth day, reaching a maximum on the sixth or seventh day This was followed by a steady rise in hemoglobin values and red blood cell counts The hemoglobin reached its normal level in approximately three weeks The platelets became plentiful within one week Characteristic changes in the bone marrow took place as early as the fourth day With improvement in the blood picture, the clinical symptoms disappeared From these encouraging results, Zuelzer concludes that synthetic folic acid is specific for this type of anemia in infants As reported by previous investigators,[2] it is also effective in the nutritional macrocytic anemias of adults

# THE SAN FRANCISCO SESSION

## AMERICAN MEDICAL ASSOCIATION, NINETY FIFTH ANNUAL SESSION
## SAN FRANCISCO, CALIF, JULY 1 5, 1946

## OFFICIAL CALL

### TO THE OFFICERS, FELLOWS AND MEMBERS OF THE AMERICAN MEDICAL ASSOCIATION

The ninety-fifth annual session of the American Medical Association will be held in San Francisco, July 1-5, 1946

The House of Delegates will convene at 10 a. m Monday, July 1 In the House the representation of the various constituent associations for 1944, 1945 and 1946 is as follows

| | | | |
|---|---|---|---|
| Alabama | 2 | New Hampshire | 1 |
| Arizona | 1 | New Jersey | 5 |
| Arkansas | 2 | New Mexico | 1 |
| California | 8 | New York | 20 |
| Colorado | 2 | North Carolina | 2 |
| Connecticut | 3 | North Dakota | 1 |
| Delaware | 1 | Ohio | 8 |
| District of Columbia | 1 | Oklahoma | 2 |
| Florida | 2 | Oregon | 1 |
| Georgia | 3 | Pennsylvania | 11 |
| Idaho | 1 | Rhode Island | 1 |
| Illinois | 9 | South Carolina | 1 |
| Indiana | 4 | South Dakota | 1 |
| Iowa | 3 | Tennessee | 2 |
| Kansas | 2 | Texas | 5 |
| Kentucky | 2 | Utah | 1 |
| Louisiana | 2 | Vermont | 1 |
| Maine | 1 | Virginia | 2 |
| Maryland | 2 | Washington | 2 |
| Massachusetts | 6 | West Virginia | 2 |
| Michigan | 5 | Wisconsin | 3 |
| Minnesota | 4 | Wyoming | 1 |
| Mississippi | 2 | Alaska | 1 |
| Missouri | 4 | Hawaii | 1 |
| Montana | 1 | Isthmian Canal Zone | 1 |
| Nebraska | 2 | Philippine Islands | 2 |
| Nevada | 1 | Puerto Rico | 1 |

The scientific sections of the American Medical Association, the Medical Corps of the Army, the Medical Corps of the Navy and the Public Health Service are entitled to one delegate each

The Scientific Assembly of the Association will open with the general meeting, to be held at 8 p m Tuesday, July 2 The sections will meet Wednesday, Thursday and Friday, July 3 4 and 5, as follows

| CONVENING AT 9 A. M. THE SECTIONS ON | CONVENING AT 2 P M. THE SECTIONS ON |
|---|---|
| Pediatrics | Internal Medicine |
| Surgery, General and Abdominal | Obstetrics and Gynecology |
| Ophthalmology | Laryngology, Otology and Rhinology |
| Experimental Medicine and Therapeutics | Pathology and Physiology |
| Nervous and Mental Diseases | Preventive and Industrial Medicine and Public Health |
| Dermatology and Syphilology | Urology |
| Gastro-Enterology and Proctology | Orthopedic Surgery |
| Radiology | Anesthesiology |
| General Practice of Medicine. | |

The Registration Bureau, which will be located on the Second Floor, Civic Auditorium, will be open from 8 30 a m until 5 30 p m. Monday Tuesday Wednesday and Thursday July 1, 2, 3 and 4 and from 8 30 a. m. to 12 noon Friday July 5

ROGER I LEE, President.
ROY W FOUTS, Speaker, House of Delegates
GEORGE F LULL, Secretary

## MEMBERS OF THE HOUSE OF DELEGATES

### A Preliminary Roster of the Legislative Body of The American Medical Association

The list of members of the House of Delegates for the session is incomplete, as a number of the state associations are yet to hold their meetings at which delegates will be elected. The following is a list of the holdover members of the House of Delegates and of the newly elected members who have been reported to the Secretary in time to be included

### *STATE DELEGATES*

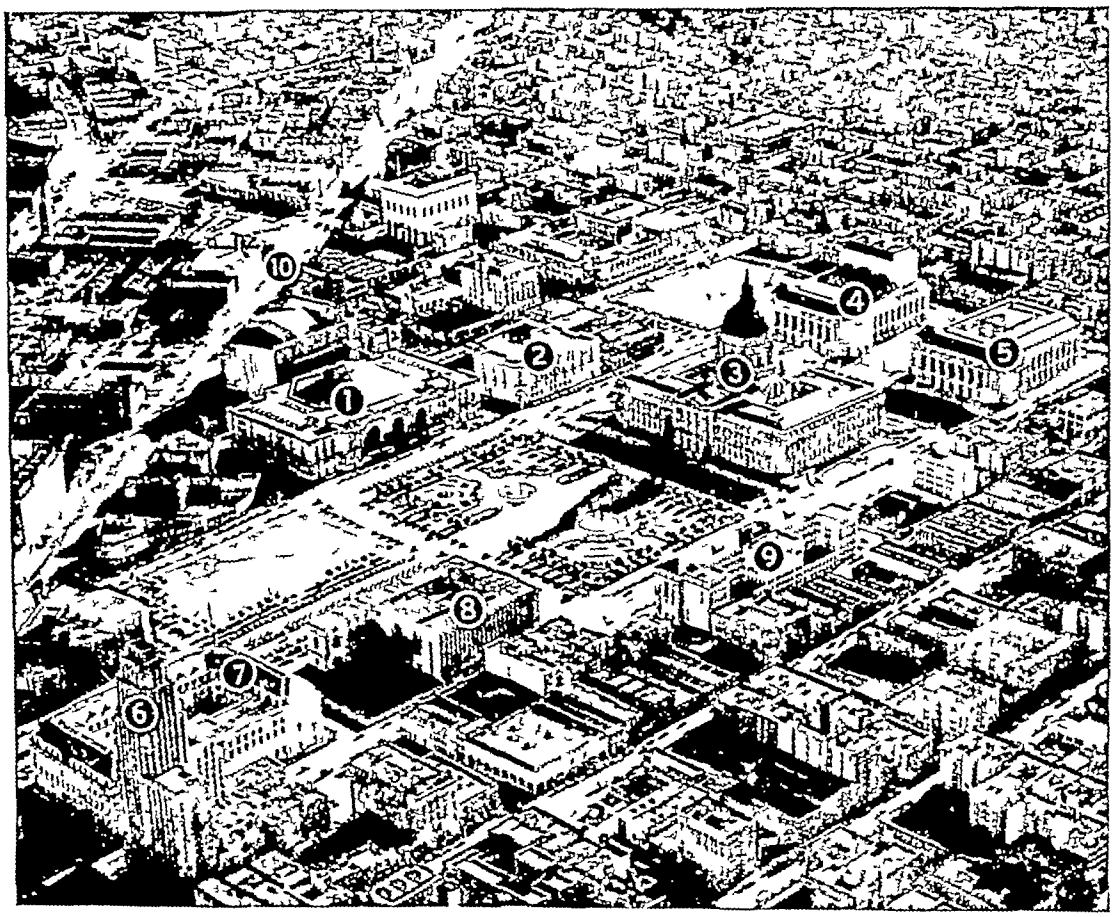
# SAN FRANCISCO 1946—CALIFORNIA INVITES YOU

She laughed upon her hills out there
Beside her bays of misty blue,
The gayest hearts, the sweetest air
That any city ever knew

*—Wallace Irwin*

Such words as "cosmopolitan" 'picturesque' and "romantic" seem somehow trite when applied to San Francisco says 'Californians, Inc" 'The city is not easy to describe You might say it has a champagne atmosphere—a bubbling, effervescent quality in the air Its dramatic setting between sea and bay resembles Sydney Its soaring buildings and mighty bridges recall New York. Its Chinatown might be in Canton its Fisherman s Wharf in Naples



the world might study with profit. That is why people of all nationalities live harmoniously together on these hills, why there are many foreign quarters but no 'foreigners'

Perhaps this is also why travelers from everywhere instinctively feel at home in San Francisco"

THE SAN FRANCISCO COUNTY MEDICAL SOCIETY

The medical profession of San Francisco revolves around its progressive county medical society, its fine hospitals with two of the leading university medical schools in the United States and an exceptional public health department.

The seventy-seven year old San Francisco County Medical Society is one of the pioneer organizations in the state Predecessor organizations go back to 1850 in the fabulous Gold Rush

AIR VIEW OF SAN FRANCISCO'S CIVIC CENTER AND ENVIRONS

1 AUDITORIUM
2 BOARD OF HEALTH BUILDING
3 CITY HALL
4 OPERA HOUSE
5 VETERANS BUILDING
6 EMPIRE HOTEL
7 FEDERAL BUILDING
8 LIBRARY
9 STATE BUILDING
10 SOUTH MARKET STREET

"Actually, San Francisco isn't 'like' any other city in the world.

'Nowhere is there a city so compact yet so free with imposing views of sea and bay and sky The steep streets, the great terraces of hotels, homes and apartments stepping up the hillsides, the vast harbor spread beneath you like a map the breeze through the Golden Gate these give San Francisco a personality all its own

Each chapter in San Francisco s storybook past added something to the city s flavor Here lingers the gracious courtliness of Spanish Dons, the rough and ready humor of the Forty-Niners the expansive hospitality of the Bonanza kings

If we had to describe San Francisco with a word that word would be tolerant' Here is a spirit of live and let live that

period At present the society numbers approximately thirteen hundred San Francisco doctors, with a membership at the highest point in its long history It is housed in a mansion which was constructed at the turn of the century and is a fine example of exterior architecture and interior beauty

THE CALIFORNIA MEDICAL ASSOCIATION

San Francisco is also the headquarters of the California Medical Association with a membership of more than eight thousand, representing 80 per cent of the state s licensed physicians It is the fourth largest state unit of the American Medical Association

The forty county units of the association are centered in the headquarters at 450 Sutter Street.

HOME OF THE SAN FRANCISCO COUNTY MEDICAL SOCIETY

GRAND STAIRCASE—
SAN FRANCISCO MEDICAL SOCIETY

ADMINISTRATIVE OFFICES—
SAN FRANCISCO COUNTY MEDICAL SOCIETY

STANFORD UNIVERSITY SCHOOL OF MEDICINE

The first medical college on the Pacific Coast was founded in 1858 in San Francisco It was discontinued in 1864 but was reorganized six years later It subsequently was transferred to Leland Stanford University in October 1938 and established as a school for training medical students The School of Medicine is an integral part of the University

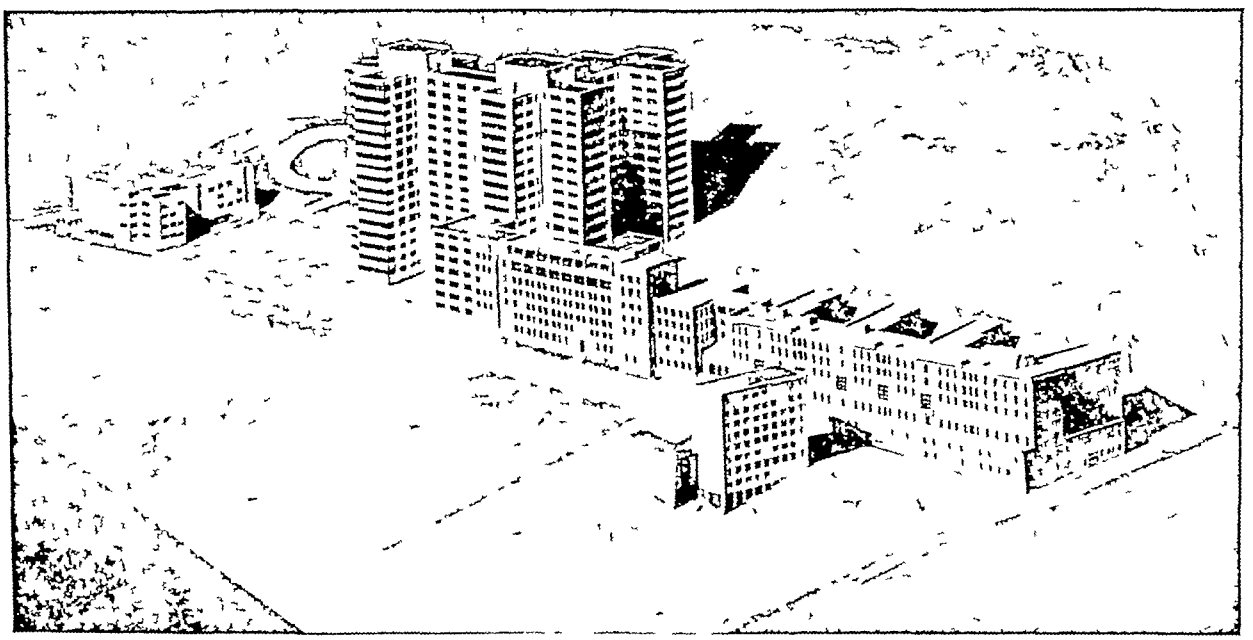
The main buildings in San Francisco are the Clinical and Laboratory Building, a Research Laboratory, Lane Hospital, with a capacity of 180 beds, and Stanford University Hospital, with a capacity of about 130 beds

The Lane Medical Library contains more than 102 000 volumes The present medical history section contains about 5 000 books and pamphlets and has received favorable notice from many distinguished scholars in this field

At present the School of Medicine controls about 500 beds in the San Francisco Hospital, averaging about 6 000 patients a year This hospital is one of the finest and most complete structures of its kind in America. In addition to the main group of buildings for surgical and medical cases there are separate buildings for the care of contagious diseases and tuberculosis This provides a great variety of clinical material

The Medical School building contains an outpatient clinic staffed by members of the faculties of the Medical School and house officers About 9,000 new patients were received during the past year, with a total number of visits of some 110,000

PROPOSED UNIVERSITY OF CALIFORNIA MEDICAL CENTER



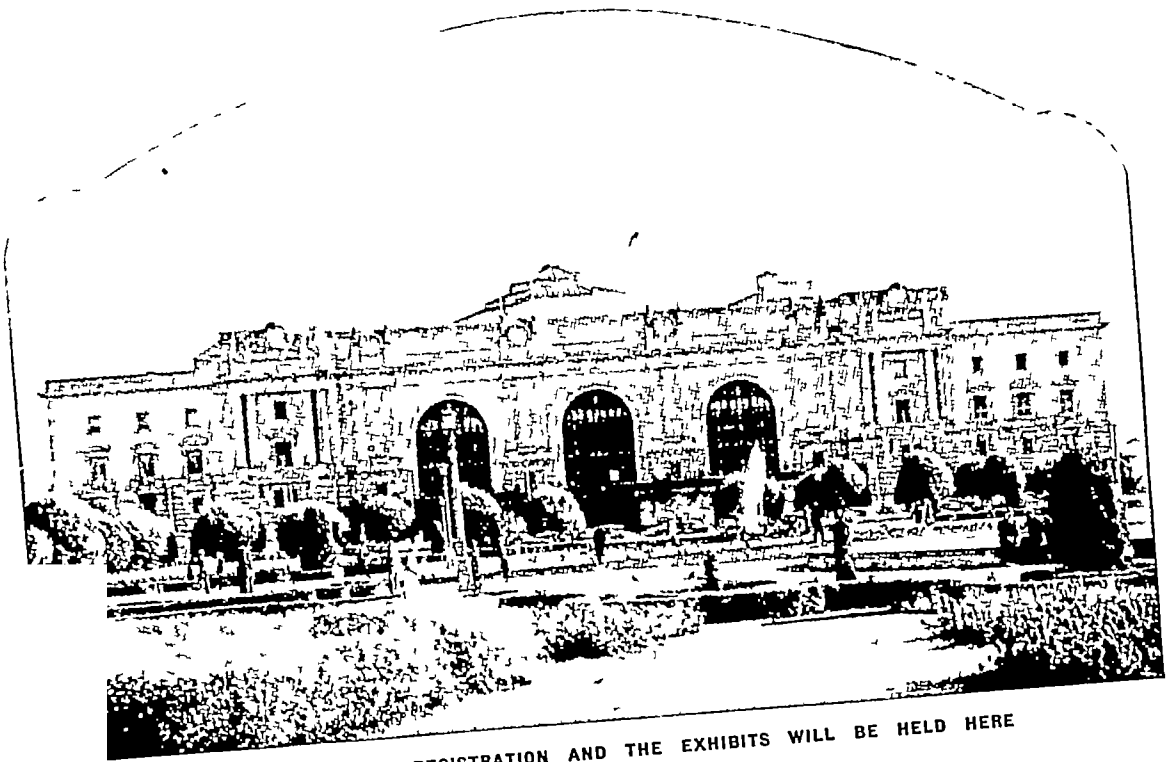
Immediate plans for the expansion of the University of California Medical Center, made possible by the appropriation of state funds of an amount in excess of eleven million dollars provide for a 500 bed Teaching Hospital a Sciences Building for the Medical School and Colleges of Pharmacy and Dentistry and a School of Nursing These will be in virtually a single building with the various school departments properly related to their beds on the various floors of the Teaching Hospital Other developments in separate structures immediately contemplated are the nurses' dormitory and interns quarters Also under discussion are a new Students Union Building and the plot plans provide for ultimate future expansion to include a private hospital immediately adjacent to the teaching hospital, for chronic diseases, medical office building and automobile parking facilities

The availability of funds for the removal of the existing medical school and the College of Pharmacy and Dentistry has made possible the adoption of plans for the development of a teaching unit which in all its departments will provide a proper relationship between hospital, school and clinic with a minimum amount of travel and lost time and with visitors staff, students and patients all confined within the areas belonging to them yet properly related to one another so that intercommunication is on the simplest basis

THE SAN FRANCISCO DEPARTMENT OF PUBLIC HEALTH

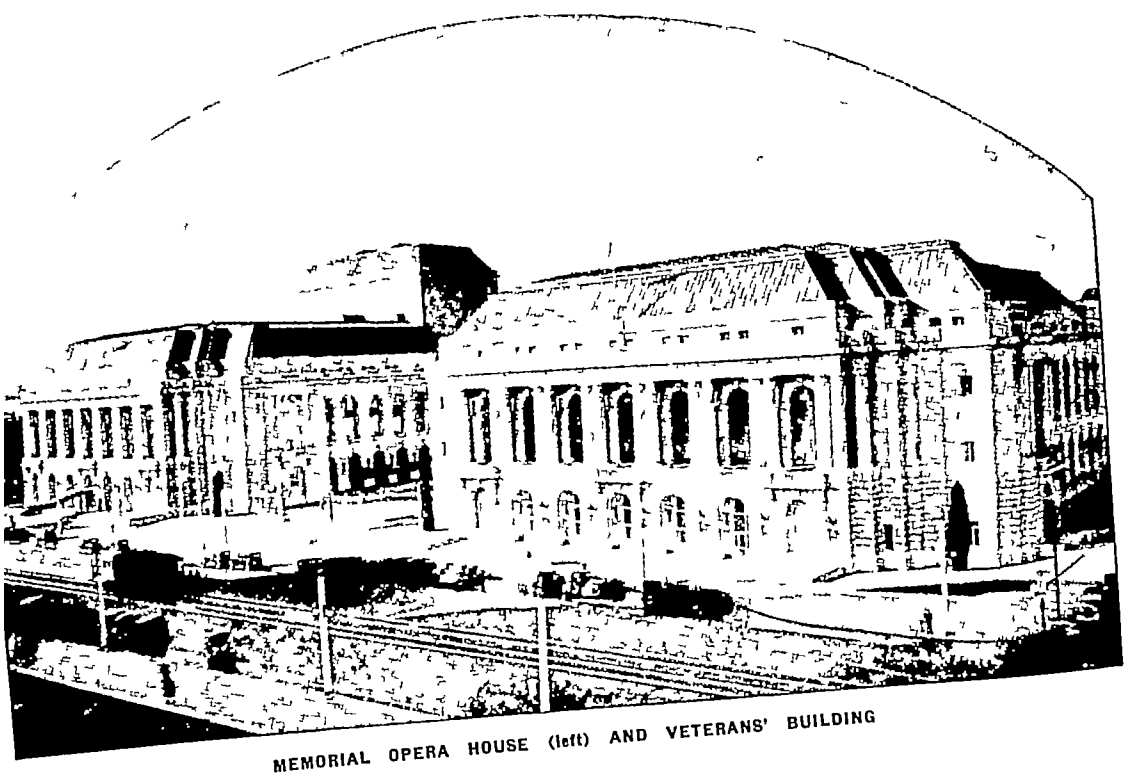
The San Francisco Department of Public Health carries on all the activities normally found in a large city health department It is responsible for the administration of the San Francisco Hospital (including a general hospital of some 675 beds a tuberculosis unit with 380 beds, an isolation unit of 34 beds and a psychiatric unit of 52 beds

The average qualifications of training and experience of the professional personnel have been described as superior to the average found in most health departments



PROPOSED UNIVERSITY OF CALIFORNIA MEDICAL CENTER FROM MODEL THROUGH COURTESY OF MR TIMOTHY PFLUEGER ARCHITECT OF NEW BUILDINGS FOR UNIVERSITY OF CALIFORNIA MEDICAL SCHOOL IN MEDICAL CENTER AT SAN FRANCISCO THE LARGE GROUP IN THE CENTER IS THE NEW TEACHING HOSPITAL AND SCIENCES BUILDING (TO BE ERECTED) AND IMMEDIATELY IN FRONT OF THAT IS A LOW STRUCTURE WHICH IS PART OF THE SCIENCES BUILDING JUST TO THE RIGHT OF THE SCIENCES BUILDING IS THE EXISTING CLINIC BUILDING THEN THE PRESENT HOSPITAL AND IMMEDIATELY IN FRONT OF THE PRESENT HOSPITAL IS THE EXISTING NURSES HOME. IN THE DISTANCE TO THE LEFT IS THE LANGLEY PORTER CLINIC THE SITE FOR A FUTURE PRIVATE HOSPITAL LIES BETWEEN THE TEACHING HOSPITAL AND THE LANGLEY PORTER CLINIC

The Emergency Hospital service with its six hospitals and accompanying ambulance service has been termed one of the most comprehensive and elaborate services of the kind in the United States



The Department of Public Health also operates the Laguna Honda Home a home for the aged housing some 1,200 ambulatory patients and an infirmary or chronic disease hospital of about 786 beds

The Hassler Health Home is a tuberculosis sanatorium with 268 beds

Other functions of the Department of Public Health are administration statistics laboratories communicable disease control including acute communicable diseases, tuberculosis and the venereal diseases, child welfare, mental hygiene, public health dentistry, public health nursing and environmental sanitation, including food and sanitation, milk and meat supervision and plumbing

CIVIC AUDITORIUM—REGISTRATION AND THE EXHIBITS WILL BE HELD HERE

MEMORIAL OPERA HOUSE (left) AND VETERANS' BUILDING

# REGISTRATION

The Bureau of Registration will be located on the second floor of the Civic Auditorium A branch postoffice in charge of government postoffice officials will be available for visitors, and an information bureau will be operated in connection with the Bureau of Registration

### Who May Register

Only Fellows, Affiliate, Associate and Honorary Fellows and Invited Guests may register and take part in the work of the sections Fellows of the Scientific Assembly are those who have, on the prescribed form, applied for Fellowship, subscribed to THE JOURNAL and paid their Fellowship dues for the current year Fellowship dues and subscription to THE JOURNAL are included in the one annual payment of $8, which is the regular subscription price of THE JOURNAL. Fellowship cards are sent to all Fellows after payment of annual dues, and these cards should be presented at the registration window Any who have not received cards for 1946 should secure them at once by writing to the American Medical Association 535 North Dearborn Street, Chicago 10

### Members in Good Standing Eligible to Apply for Fellowship in the Association

Members in good standing in the American Medical Association are those members of component county medical societies and of constituent state and territorial medical associations whoses names are officially reported for enrolment to the Secretary of the American Medical Association by the secretaries of the constituent medical associations All members in good standing may apply for Fellowship in the Scientific Assembly and are urged to qualify as Fellows before leaving home in order that pocket cards may be secured and brought to San Francisco so that registration can be more easily and more promptly effected.

Application forms may be had on request

Those subscribers to THE JOURNAL who have not received pocket cards for 1946 should write to the American Medical Association in order to obtain application blanks and information as to further requirements

### Register Early

Fellows living in San Francisco, as well as all other Fellows who are in San Francisco on Monday and Tuesday, should register as early as possible.

The names and local addresses of those who register will be included in the issue of the *Daily Bulletin* appearing the next day, and this will enable visiting physicians to find friends who have registered.

### Suggestions That Will Facilitate Registration

Fellows should fill out completely the spaces on both sections of the front of the *white* registration card, which will be found on the tables in front of the Registration Bureau

Physicians who desire to qualify as Fellows should fill out completely the spaces on both sections of the front of the *blue* registration card and sign the application on the back These cards will be found on the tables

Entries on the registration card should be written plainly, or printed, as the cards are given to the printer to use as "copy" for the *Daily Bulletin*, which appears on Tuesday, Wednesday, Thursday and Friday mornings during the week of the session

Fellows who have their pocket cards with them can be registered with little or no delay They should present the filled out *white* registration card together with the pocket card at one of the windows marked "Registration by Pocket Card" There the clerk will compare the two cards, stamp the pocket card and return it and supply the Fellow with a badge, a copy of the official program and other printed matter of interest to those attending the annual session

As previously stated, it will assist in registering if those who desire to qualify as Fellows will file their applications and qualify as Fellows by writing directly to the American Medical Association, 535 North Dearborn Street, Chicago 10, so that their Fellowship may be entered not later than June 10 Any applications that are received later than June 10 will be given prompt attention, but the Fellowship pocket card may not reach the applicant in time for him to register at the San Francisco session.

It will be possible for members of the organization to qualify as Fellows at San Francisco In order to do this, applicants for Fellowship will be required to fill out both sections of the front of the *blue* registration card and to sign the formal application that is printed on the reverse side of the card. It is suggested that those members who apply for Fellowship at San Francisco bring with them their state membership cards for the year 1946 The state membership card should be presented along with the filled in *blue* registration card at the window in the booth marked "Applicants for Fellowship and Invited Guests"

As already stated, registration can be effected more easily and more promptly if members will qualify as Fellows before leaving home

### Registration for General Officers and Delegates at the St Francis Hotel

General Officers of the American Medical Association and members of the House of Delegates may register for the Scientific Assembly outside the foyer of the Colonial Room of the St Francis Hotel This arrangement is made for the convenience of the members of the House of Delegates, which will convene on Monday morning at 10 o'clock in the Colonial Room of the St. Francis Hotel Delegates are requested to register for the Scientific Assembly before presenting credentials to the Reference Committee on Credentials of the House of Delegates Registration of delegates for the Scientific Assembly will begin at 8 o'clock Monday morning, July 1, and delegates are urged to register early so that all members of the House of Delegates may be seated in time for the opening session of the House

# TRANSPORTATION

It is suggested that those Fellows who contemplate traveling to San Francisco to attend the annual session of the Association secure information concerning railroad and airplane travel directly from their local ticket agents, who are in a position to give them information regarding train or plane schedules and fares Transcontinental railroads to San Francisco terminate in Oakland Mole, and ferries then transport passengers across the Bay to Market Street Ferry Depot.

# WEATHER CONDITIONS IN SAN FRANCISCO

With regard to temperature conditions of the San Francisco Bay Region in the month of July it is well to keep in mind that, while the weather will probably be consistently warm it is also possible that there may be cold breezes Clothing for the occurrence of such a condition should therefore be taken to San Francisco

# SAN FRANCISCO HOTELS

A list of San Francisco hotels is presented for the benefit of those who expect to attend the annual session of the American Medical Association, July 1-5 Dr M Laurence Montgomery is chairman of the Subcommittee on Hotels and may be addressed at 200 Civic Auditorium, San Francisco, Calif The advertising announcement and a coupon to be used for making reservations appear on advertising page 48 of this issue.

Since reservations are cleared through the subcommittee on hotels, it will greatly expedite matters if requests for reservations are addressed directly to Dr Montgomery

## Schedule of Rates

# GOLF TOURNAMENT

The American Medical Golfing Association will hold its thirtieth tournament at the Olympic Club using the Lakeside Golf Course in San Francisco, on Monday, July 1

TROPHIES AND PRIZES

Trophies will be awarded for the Association Championship, the Will Walter Trophy, the Association Handicap Championship the Detroit Trophy, Championship Flight, First Gross, the St Louis Trophy, Championship Flight, First Net, the President's Trophy, donated by D A Williams of Kansas City, Eighteen Hole Championship, the Golden State Trophy, Eighteen Hole Handicap Championship the Ben Thomas Trophy and the Atlantic City Trophy Maturity Event, the Minneapolis Trophy, and the Oldguard Championship, the Wendell Phillips Trophy

In addition to these, approximately fifty other prizes will be in competition

CHAMPIONSHIP COURSE

Lakeside, a thirty-six-hole championship course on the shores of the blue Pacific, is one of the finest courses in America. It is ideal for experts and a treat for dubs and beginners The beautiful club house has every facility, including a large locker room and an indoor swimming pool The San Francisco committee has provided a layout fit for kings, including the golfers' banquet at Monaco Theatre Restaurant, International Settlement Old Barbary Coast a fascinating place in a historical setting long to be remembered Transportation to and from the golf course to the restaurant will be provided

SAN FRANCISCO COMMITTEE ON ARRANGEMENTS

The San Francisco Committee on Arrangements is under the chairmanship of A M G A Past-President James Eaves, 410 Hawthorne Avenue, Oakland, Calif The Executive Committee is composed of A M G A Past Presidents Walter F

Schaller, James W Morgan and Frank Sheehy Others on the committee are Bradford F Dearing, vice chairman, Henry H Searls and H Clare Shepardson.

APPLICATION FOR MEMBERSHIP

This Victory Postwar Tournament will be a celebratory event. Old and new fellows have the opportunity to enjoy a wonderful day of golf, to win a nice prize and to join in the good fellowship of the A M G A

All male fellows of the American Medical Association are cordially invited to become members of the American Medical Golfing Association Write Executive Secretary Bill Burns, 2020 Olds Tower, Lansing 8, Mich, for application blank

Participants in the tournament are required to present their home club handicap, signed by the club secretary, or to accept a handicap set by the A. M G A handicap committee. No handicap over 30 is allowed A Fellow absent from the annual banquet following the tournament forfeits his rights to a trophy or prize.

A M G A OFFICERS

D A Williams of Kansas City is President, Charles E Shannon of Chicago and W C Speidel of Seattle are Vice Presidents of the A M G A President Williams anticipates that over 200 Fellows of the A M G A will visit Olympic July 1 to enjoy the A M G A's Victory Postwar Tournament

Discussion leaders to be announced.

# PRELIMINARY PROGRAM OF THE SCIENTIFIC ASSEMBLY

## GENERAL SCIENTIFIC MEETINGS

**War Memorial Opera House Auditorium, Civic Center**

MONDAY, JULY 1—2 P M

EDWARD L BORTZ, Chairman, Council on Scientific Assembly Presiding

The Present Status of Penicillin and Streptomycin
ARTHUR L BLOOMFIELD, San Francisco

The Anemias Types and Principles of Treatment.
CHARLES AUSTIN DOAN, Columbus Ohio

Blood Derivatives CHARLES A JANEWAY Boston

Intermission

3 30 P M

WILLIAM R MOLONY SR., Vice President, American Medical Association, Presiding

Thrombosis and Embolism ALTON OCHSNER, New Orleans

Dichlorodiphenyltrichloroethane (DDT)
COLONEL WILLIAM STONE, Medical Corps, Army of the United States

The Treatment of Bacterial Infections of the Skin
DONALD PILLSBURY, Philadelphia

TUESDAY, JULY 2—9 30 A M

FREDERICK A COLLER, Member, Council on Scientific Assembly, Presiding

Modern Concepts of the Neuroses
KARL M BOWMAN, San Francisco

Neurotropic Virus Diseases THOMAS RIVERS, New York.

Virus Infections of the Respiratory Tract Their Prevention and Treatment HOBART A REIMANN Philadelphia

Intermission

11 A. M

CLYDE L CUMMER Member, Council on Scientific Assembly, Presiding

Rheumatic Fever Its Recognition and Treatment
GEORGE C GRIFFITH, Los Angeles

The Malaria Problem Today
CAPTAIN J J SAPERO (MC), U S N

Peptic Ulcer ANDREW C IVY Chicago

TUESDAY, JULY 2—2 P M

CHARLES H PHIFER Member Council on Scientific Assembly, Presiding

The Modern Treatment of Syphilis
PAUL A O'LEARY, Rochester, Minn.

The Adequate Treatment of Gonorrhea
J R HELLER JR, U S P H S

The Use of Insulin in the Treatment of Diabetes
LESTER PALMER, Seattle.

Intermission

3 30 P M

HENRY R VIETS, Member, Council on Scientific Assembly, Presiding

The Relationship of Physical Medicine to General Practice.
GEORGE MORRIS PIERSOL, Philadelphia

The Use of Isotopes in Medical Research
JOHN H LAWRENCE, Berkeley, Calif

Uses and Abuses of the Male Sex Hormones
WILLARD OWEN THOMPSON, Chicago

## THE OPENING GENERAL MEETING

**War Memorial Opera House Auditorium, Civic Center**

TUESDAY, JULY 2—8 00 P M

MEETS IN HIGH SCHOOL OF COMMERCE AUDITORIUM

### OFFICERS OF SECTION

Chairman—WILLIAM D STROUD, Philadelphia
Vice Chairman—W O THOMPSON, Chicago
Secretary—CECIL J WATSON Minneapolis
Executive Committee—ROY W SCOTT Cleveland BURRELL O RAULSTON, Los Angeles, WILLIAM D STROUD Philadelphia

### Wednesday, July 3—2 p m.

Treatment of Hyperthyroidism with Radioactive Iodine (Lantern Demonstration) E M CHAPMAN, Boston
Discussion to be opened by MAYO H SOLEY, JOSEPH G HAMILTON and EARL R MILLER San Francisco

A Consideration of Some of the Newer Antimalarials (Lantern Demonstration) JAMES A SHANNON, New York
Discussion to be opened by FRANCIS R DIEUAIDE New York

The Frank Billings Lecture The Problem of Ketosis
R T WOODYATT Chicago

Newer Concepts of the Endocrine Regulation of Carbohydrate Metabolism (Lantern Demonstration)
DEWITT STETTEN JR New York
Discussion to be opened by LIEUTENANT LAURANCE W KINSELL (MC) U S N R

The Antianemic Activity of Lactobacillus Casei Factor ("Folic Acid") (Lantern Demonstration)
CARL V MOORE, St. Louis
Discussion to be opened by M M WINTROBE Salt Lake City

### Thursday, July 4—2 p m

Election of Officers

Physical Sequelae of the Atomic Bomb Explosion (Lantern Demonstration) GEORGE V LEROY Chicago
Discussion to be opened by VERNE R MASON Los Angeles

The Low Sodium Diet in Congestive Heart Failure (Lantern Demonstration)
PAUL D WHITE WILLIAM B BRIDGES and EDWIN O WHEELER, Boston

Studies on the Pathogenesis of Peripheral Edema in Congestive Heart Failure (Lantern Demonstration)
FRANCIS REICHSMAN HAROLD GRANT and T R HARRISON Dallas Texas
Discussion on papers of DRS WHITE BRIDGES and WHEELER and DRS REICHSMAN GRANT and HARRISON to be opened by JAMES V WARREN, Medical Corps Army of the United States and T R SCHEMM Great Falls Mont

Chairman's Address Optimism in Medicine.
WILLIAM D STROUD Philadelphia

Penicillin Aerosolization in the Treatment of Lobar Pneumonia Bronchiectasis and Lung Abscess (Lantern Demonstration) MAURICE S SEGAL Boston
Discussion to be opened by ALVAN L BARACH, New York.

Fungous Diseases Encountered in a General Hospital Practice (Lantern Demonstration) D T SMITH Durham N C
Discussion to be opened by C E SMITH San Francisco JOHN F KESSEL, Los Angeles and RALPH G RIGDY, Chicago

Streptomycin Its Clinical Uses and Limitations (Lantern Demonstration) D R NICHOLS, Rochester Minn

### Friday, July 5—9 a m

JOINT MEETING WITH SECTION ON EXPERIMENTAL MEDICINE AND THERAPEUTICS IN HIGH SCHOOL OF COMMERCE, BOYS' GYMNASIUM

The Use of Streptomycin in Clinical Practice (Lantern Demonstration) HUGH J MORGAN Nashville Tenn
Discussion on papers of DR. NICHOLS (presented in Section on Internal Medicine on Thursday July 4) and DR MORGAN to be opened by HOBART A REIMANN Philadelphia, and COL. MICHAEL E DEBAKEY, Medical Corps Army of the United States

Recent Studies on Hepatitis (Lantern Demonstration)
JOSEPH STOKES JR, JOHN R NEFFE J G REINHOLD and SIDNEY GELLIS, Philadelphia
Discussion to be opened by ALBERT M SNELL, Rochester, Minn and DAVID A WOOD San Francisco

*PANEL DISCUSSION ON THERAPEUTIC INFORMATION PLEASE*

JAMES A PAULLIN Atlanta Ga, Moderator

What's New in Hematology C C STURGIS Ann Arbor Mich
What's New in Tropical Medicine (Lantern Demonstration) ERNEST C FAUST New Orleans
What's New in Gastroenterology WALTER C ALVAREZ Rochester Minn
What's New in Infectious Diseases HOBART A REIMANN, Philadelphia
What's New in Endocrinology EDWARD H RYNEARSON Rochester, Minn
What's New in Virus Diseases E W SCHULTZ Stanford University, Calif
What's New in Cancer FRANK E ADAIR New York
What's New in Arthritis PHILIP S HENCH Rochester Minn

## SECTION ON SURGERY, GENERAL AND ABDOMINAL

MEETS IN WAR MEMORIAL OPERA HOUSE AUDITORIUM

### OFFICERS OF SECTION

Chairman—DANIEL C. ELKIN Atlanta Ga
Vice Chairman—WILLIAM D ANDRUS New York
Secretary—ALTON OCHSNER New Orleans
Executive Committee—ARTHUR W ALLEN Boston FREDERICK A COLLER, Ann Arbor Mich DANIEL C ELKIN Atlanta, Ga

### Wednesday, July 3—9 a m.

The Problem of Phlebothrombosis and Thrombophlebitis
THOMAS B AYCOCK and JAMES W HENDRICK Baltimore
Discussion to be opened by J Ross VEAL Washington, D C and ALTON OCHSNER New Orleans

Heparin in the Treatment of Thromboembolic Disease
LEO LOEWE and EDWARD HIRSCH Brooklyn
Discussion to be opened by F W BANCROFT and ARTHUR H BLAKEMORE New York

Venous Thrombosis and Pulmonary Embolism (Lantern and Motion Picture Demonstration)
ARTHUR W ALLEN ROBERT R LINTON and GORDON A DONALDSON Boston
Discussion to be opened by GEZA DE TAKATS Chicago and ALTON OCHSNER, New Orleans

Sympathectomy for Peripheral Vascular Sclerosis
GEZA DE TAKATS Chicago
Discussion to be opened by FELIX PEARL San Francisco and ALTON OCHSNER, New Orleans

The Evaluation of Operative Procedures for Repair of Arteriovenous Fistulas Statistical Analysis of 53 Cases (Lantern Demonstration)
E CRAIG HERINGMAN JAMES D RIVES and HARRY A DAVIS New Orleans
Discussion to be opened by EMILE F HOLMAN and MAJOR NORMAN FREEMAN Medical Corps Army of the United States

Newer Concepts in the Mechanism and Management of Head Injury (Lantern Demonstration)
E S GURDJIAN and J E WEBSTER Detroit.
Discussion to be opened by HOWARD C NAFFZIGER San Francisco

Herniation of Subfascial Fat as a Cause of Low Back Pain Results of Surgical Treatment (Lantern Demonstration) RALPH HERZ, Cleveland
Discussion to be opened by PHILIP S HENCH, Rochester Minn, and C LEE GRABER, Cleveland

**Thursday, July 4—9 a m**

**Election of Officers**

Chairman's Address Exposure of Blood Vessels (Lantern Demonstration) DANIEL C ELKIN, Atlanta Ga

Transdiaphragmatic Vagus Resection in Peptic Ulcer Physiologic Effects and Early Results (Lantern Demonstration)
FRANCIS D MOORE, WILLIAM P CHAPMAN, CHESTER M JONES and MILFORD D SCHULZ, Boston
Discussion to be opened by LELAND S MCKITTRICK, Boston, and LESTER R DRAGSTEDT, Chicago

Benign Strictures of the Bile Ducts (Lantern Demonstration) RICHARD B CATTELL, Boston

The Early Recognition and Management of Intestinal Strangulation (Lantern Demonstration) EVERETT I EVANS Richmond, Va
Discussion to be opened by LELAND S MCKITTRICK, Boston

Discussion to be opened by MEYER WIENER, Coronado Calif and A RAY IRVINE, Beverly Hills Calif

A Neglected Cause of Secondary Glaucoma in Eyes in Which the Lens Is Absent or Dislocated (Lantern Demonstration) PAUL A CHANDLER, Boston
Discussion to be opened by JOHN H DUNNINGTON, New York, and EVERETT L GOAR Houston Texas.

Inheritance of Retinoblastoma (Lantern Demonstration)
HAROLD F FALLS Ann Arbor Mich
Discussion to be opened by THEODORE L TERRY, Boston, and C WILBUR RUCKER Rochester, Minn

**Demonstration of New Instruments**

### Friday, July 5—9 a m

JOINT MEETING WITH SECTION ON NERVOUS AND MENTAL DISEASES

Chairman's Address The Practice of Neurology in the U S A (Lantern Demonstration)
PERCIVAL BAILEY Chicago

Present Trends in the Practice of Neurology
GEORGE WILSON and CHARLES RUPP JR, Philadelphia
Discussion to be opened by J M NIELSEN and JOHN B DOYLE Los Angeles

Ocular Manifestations of Psychosomatic Disorders
DAVID O HARRINGTON San Francisco
Discussion to be opened by GEORGE STUART CAMPION San Francisco and MEYER A. ZELIGS, Oakland Calif

The Surgical Problem of Intracranial Aneurysm and Allied Vascular Lesions (Lantern Demonstration)
JOHN MARTIN Chicago
Discussion to be opened by JOHN E RAAF, Portland Ore. and HALE A HAVEN, Seattle.

Visual Field Changes Confirmed by Pathologic Diagnosis (Lantern Demonstration)
DONALD J LYLE Cincinnati
Discussion to be opened by CAPTAIN JOHN S MCGAVIC Medical Corps, Army of the United States and P J LEINFELDER, Iowa City

Management of Patients with Chronic Headache (Lantern Demonstration)
ARNOLD P FRIEDMAN, CHARLES BRENNER and H HOUSTON MERRITT, New York.
Discussion to be opened by CHARLES D ARING Cincinnati and J M NIELSEN Los Angeles

---

## SECTION ON LARYNGOLOGY, OTOLOGY AND RHINOLOGY

MEETS IN WAR MEMORIAL VETERANS BUILDING AUDITORIUM

### OFFICERS OF SECTION

Chairman—LOUIS H CLERF, Philadelphia
Vice Chairman—HENRY B ORTON, Newark N J
Secretary—FLETCHER D WOODWARD Charlottesville Va
Executive Committee—GORDON F HARKNESS Davenport Iowa CLAUDE C COBY Houston Texas LOUIS H CLERF Philadelphia

### Wednesday, July 3—2 p m.

Treatment of Neck Infections (Lantern Demonstration)
C H MCCASKEY Indianapolis
Discussion to be opened by J M BROWN Los Angeles

Surgical Treatment of Bilateral Abductor Muscular Paralysis as a Complication of Thyroidectomy
JOSEPH D KELLY New York
Discussion to be opened by SIMON JESBERG Los Angeles and LEWIS F MORRISON San Francisco

Pressure Treatment of Allergic Sinusitis (Lantern Demonstration) J M ROBISON, Houston Texas
Discussion to be opened by HOMER E. PRINCE, Houston Texas, and OSCAR SWINEFORD JR, Charlottesville, Va

The Diagnosis of Myasthenia Gravis in Patients with Dysphagia (Lantern Demonstration)
HENRY R VIETS Boston
Discussion to be opened by WALTER F SCHALLER and HENRY W NEWMAN, San Francisco

Nebulization Therapy in Bronchiectasis (Lantern Demonstration) A M OLSEN Rochester, Minn
Discussion to be opened by ALVAN L. BARACH New York, and DANIEL MILLER, Boston

### Thursday, July 4—2 p m

**Executive Session**

**Election of Officers**

Chairman's Address Keratosis of the Larynx (Lantern and Motion Picture Demonstration)
LOUIS H CLERF, Philadelphia

Complete Grafts of Skin and Cartilage from the Ear in Reconstruction of the Nose (Lantern Demonstration)
JAMES BARRETT BROWN, St Louis, and BRADFORD CANNON, Boston
Discussion to be opened by WILLIAM S KISKADDEN Los Angeles, and WALTER B MACOMBER, Albany, N Y

Fenestration Operation for Deafness
JULIUS A WEBER Seattle
Discussion to be opened by HOWARD P HOUSE, Los Angeles

The Modern Treatment of Sinusitis
LELAND G HUNNICUTT, Pasadena, Calif
Discussion to be opened by LEWIS F MORRISON and ROBERT C MCNAUGHT, San Francisco

### Friday, July 5—9 a m

JOINT MEETING WITH SECTION ON RADIOLOGY IN WAR MEMORIAL VETERANS BUILDING ROOM 223

Radium Treatment of Hyperplastic Lymphoid Tissue in the Nasopharynx. EDWARD M WALZL Baltimore
Discussion to be opened by H A FLETCHER San Francisco, and J S MIKELL, Tucson Ariz.

Supervoltage Roentgen Therapy for Carcinoma of the Esophagus
FRANZ J BUSCHKE and SIMEON T CANTRIL Seattle

Roentgen Therapy for Carcinoma of the Larynx (Lantern Demonstration) MAURICE LENZ New York

Surgical Management of Carcinoma of the Larynx
SIMON JESBERG Los Angeles
Discussion to be opened by ORVILLE N MELAND Los Angeles, and JULIUS A WEBER, Seattle.

Surgical Aspects of Bronchogenic Carcinoma (Lantern Demonstration) JOHN C JONES Los Angeles

---

## SECTION ON PEDIATRICS

MEETS IN HIGH SCHOOL OF COMMERCE AUDITORIUM

### OFFICERS OF SECTION

Chairman—JOHN AIKMAN, Rochester, N Y
Vice Chairman—HENRY G PONCHER Chicago
Secretary—GILBERT J LEVY, Memphis, Tenn
Executive Committee—PHILIP M STIMSON New York, HUGH L DWYER Kansas City, Mo, JOHN AIKMAN, Rochester, N Y

### Wednesday, July 3—9 a m

The Immunology of Allergy as Illustrated by Hay Fever (Lantern Demonstration) MILTON B COHEN, Cleveland
Discussion to be opened by GEORGE B LOGAN, Rochester, Minn, and GEORGE PINESS Los Angeles

Symptomatic Treatment of Bronchial Asthma in Infants and Children (Lantern Demonstration)
JEROME GLASER Rochester N Y
Discussion to be opened by VERNON W SPICKARD, Seattle, and WILLIAM C DEAMER, San Francisco

Eczema and the Essential Fatty Acids (Lantern Demonstration)
ARILD E. HANSEN, Galveston Texas
Discussion to be opened by ALTON GOLDBLOOM Montreal, Canada, and IRVINE MCQUARRIE, Minneapolis

Overdosage with Vitamin A (Lantern Demonstration)
JOHN A TOOMEY, Cleveland
Discussion to be opened by J M LEWIS, New York.

Psychologic Problems of Children.
CLIFFORD D SWEET, Oakland, Calif

The Present Status of the Study of Child Health Services (Lantern Demonstration)
JOHN P HUBBARD, Washington, D C
Discussion to be opened by GEORGE M WHEATLY, New York

**Thursday, July 4—9 a m**

**Election of Officers**

Treatment of Typhoid with Specific Bacteriophage (Lantern Demonstration)
PAUL A REICHLE and WALTER E WARD, Los Angeles, E G KNOUF South Pasadena, Calif, A G BOWER, Glendale, Calif, and PAUL M HAMILTON, San Marino, Calif

Measures for Protection of Newborn Infants (Lantern Demonstration) CHARLES A WEYMÜLLER, Brooklyn

Evaluation of the Use of Penicillin in the Treatment of Syphilis in Children (Lantern Demonstration)
JOSEPH YAMPOLSKY and ALBERT S HEYMAN, Atlanta, Ga
Discussion to be opened by OSCAR REISS, Los Angeles

Immunization Procedures in Pediatrics (Lantern Demonstration) JOHN J MILLER JR., San Francisco
Discussion to be opened by ALFRED E FISCHER, New York, and H E THELANDER, San Francisco

Triodine in the Treatment of Epilepsy (Lantern Demonstration)
WILLIAM G LENNOX, Boston

Benign Histoplasmosis and Pulmonary Calcification (Lantern Demonstration)
AMOS CHRISTIE and J C PETERSON, Nashville, Tenn

**Friday, July 5—9 a m**

The Knowledge on Human Virus Infections of Animal Origin (Lantern Demonstration)
KARL F MEYER San Francisco

*SYMPOSIUM ON ANEMIA IN INFANCY AND CHILDHOOD*

Pathogenesis WOLF W ZUELZER, Detroit

Diagnosis (Lantern Demonstration)
CARL H SMITH, New York

Classification (Lantern Demonstration)
JAMES M BATY Brookline Mass

Treatment HENRY G PONCHER, Chicago

---

## SECTION ON EXPERIMENTAL MEDICINE AND THERAPEUTICS

MEETS IN HIGH SCHOOL OF COMMERCE, BOYS' GYMNASIUM

### OFFICERS OF SECTION

Chairman—E V ALLEN, Rochester, Minn
Vice Chairman—CARL A DRAGSTEDT, Chicago
Secretary—DWIGHT L WILBUR, San Francisco
Executive Committee—WALLACE M YATER, Washington D C, TINSLEY R HARRISON, Dallas, Texas, E V ALLEN, Rochester, Minn.

**Wednesday, July 3—9 a m**

The Prevention of Renal Complications by the Use of Sulfonamide Mixtures (Lantern Demonstration)
DAVID LEHR, New York

Some Observations on Hypercholesterolemia and the Effects of Decholesterizing Agents (Lantern Demonstration)
GEORGE R HERRMANN, Galveston, Texas

Tridione, a New Anticonvulsant Drug (Lantern Demonstration)
RICHARD K. RICHARDS, North Chicago, Ill

*SYMPOSIUM ON UNUSUAL DISEASES*

Disseminated Lupus Erythematosus and Disseminated Scleroderma (Lantern Demonstration)
GEORGE BAEHR and ABOU D POLLACK, New York

Sarcoidosis (Lantern Demonstration) I SNAPPER, New York.
*Discussion on papers of* DRS BAEHR and POLLACK and DR SNAPPER to be opened by L HENRY GARLAND, San Francisco

Observations on the Electrocardiogram Made During Experimental Distention of the Human Gallbladder (Lantern Demonstration)
HOWARD WAKEFIELD and SELIM A MCARTHUR, Chicago

Thiouracil Remission or Relapse of Hyperthyroidism After Discontinuing Its Use (Lantern Demonstration)
ELMER C BARTELS, Boston.

**Thursday, July 4—9 a m**

**Election of Officers**

*SYMPOSIUM ON TREATMENT*

Chairman's Address The Challenge of Intravascular Thrombosis and the Clinical Use of Anticoagulants (Lantern Demonstration) E V ALLEN, Rochester, Minn.

The Diagnosis and Management of Spontaneous Hypoglycemia (Lantern Demonstration)
J W CONN, Ann Arbor, Mich
Discussion to be opened by HOWARD F WEST, Los Angeles

The Management of the Jaundiced Patient with Consideration of the Indications for Surgical Treatment (Lantern Demonstration) ALBERT M SNELL, Rochester, Minn
Discussion to be opened by LEON GOLDMAN, San Francisco

The Proof of and Treatment of Vitamin Deficiencies in an Individual Case (Lantern Demonstration)
TOM D SPIES, Birmingham, Ala, and CARL VILTER Cincinnati

The Treatment of Diseases of Virus Origin
MONROE D EATON, Berkeley, Calif

The Treatment of Coronary Artery Disease (Lantern Demonstration) O P J FALK, St Louis
Discussion to be opened by ARLIE R BARNES, Rochester, Minn, E STERLING NICHOL, Miami, Fla, and WILLIAM J KERR, San Francisco

**Friday, July 5—9 a m**

JOINT MEETING WITH SECTION ON INTERNAL MEDICINE

The Use of Streptomycin in Clinical Practice (Lantern Demonstration) HUGH J MORGAN, Nashville, Tenn.
Discussion on papers of DR. NICHOLS (presented in Section on Internal Medicine on Thursday, July 4) and DR MORGAN to be opened by HOBART A REIMANN Philadelphia, and COL MICHAEL E DEBAKEY, Medical Corps, Army of the United States

Recent Studies on Hepatitis (Lantern Demonstration)
JOSEPH STOKES JR, JOHN R NEEFE, J G REINHOLD and SIDNEY GELLIS, Philadelphia
Discussion to be opened by ALBERT M SNELL, Rochester, Minn, and DAVID A WOOD, San Francisco

*PANEL DISCUSSION ON THERAPEUTIC INFORMATION PLEASE*

JAMES A PAULLIN, Atlanta, Ga, Moderator

What's New in Hematology C C STURGIS, Ann Arbor, Mich.
What's New in Tropical Medicine (Lantern Demonstration)
ERNEST C FAUST, New Orleans
What's New in Gastroenterology
WALTER C ALVAREZ, Rochester, Minn
What's New in Infectious Diseases
HOBART A REIMANN, Philadelphia
What's New in Endocrinology
EDWARD H RYNEARSON, Rochester, Minn.
What's New in Virus Diseases
E W SCHULTZ, Stanford University, Calif
What's New in Cancer FRANK E ADAIR, New York.
What's New in Arthritis PHILIP S HENCH, Rochester, Minn

---

## SECTION ON PATHOLOGY AND PHYSIOLOGY

MEETS IN HIGH SCHOOL OF COMMERCE, BOYS' GYMNASIUM

### OFFICERS OF SECTION

Chairman—VIRGIL H MOON, Philadelphia
Vice Chairman—J J MOORE, Chicago
Secretary—FRANK W HARTMAN, Detroit.
Executive Committee—J P SIMONDS, Chicago, FRANK C. MANN, Rochester, Minn, VIRGIL H MOON, Philadelphia

### Wednesday, July 3—2 p m

*SYMPOSIUM ON RENAL INSUFFICIENCY IN THE SHOCK SYNDROME*

An Extrarenal Uremia and Tubular Disease of the Kidney (Lantern Demonstration) E T BELL, Minneapolis

Study of the Crush Syndrome and Posttraumatic Anuria (Lantern Demonstration) A C CORCORAN, Cleveland.

Studies on the Kidney Associated with Severe Burns P C MARTINEAU and F W HARTMAN, Detroit.

Chairman's Address Renal Deficiency Associated with Shock (Lantern Demonstration) VIRGIL H MOON, Philadelphia.

### Thursday, July 4—2 p m.

**Election of Officers**

*SYMPOSIUM ON PHYSIOLOGY OF HIGH ALTITUDE FLIGHT*

Concepts Derived from Investigations Pertaining to High Altitude Flight. CAPTAIN A R. BEHNKE (MC), U S N R

Some Factors Which Affect the Incidence of Bends at Altitude (Lantern Demonstration) W L BURCKHARDT, H F ADLER, A J ATKINSON and A C IVY, Chicago

Protection of Flying Personnel Against High Impact Forces COMMANDER HOWARD R BIERMAN (MC), U S N R.

The Effect of Continuous and Intermittent Pressure Breathing on Kidney Function DOUGLAS R DRURY, Los Angeles

Clinical Applications of Aviation Physiology H F HELMHOLZ JR, Rochester Minn

### Friday, July 5—9 a m

JOINT MEETING WITH SECTION ON GASTROENTEROLOGY AND PROCTOLOGY IN HIGH SCHOOL OF COMMERCE GIRLS' GYMNASIUM

*SYMPOSIUM ON DISEASES OF THE LIVER*

Physiology of Liver Disease

Application of Modern Physiologic Concepts to Treatment of Disease of the Liver JAMES F WEIR, Rochester, Minn

Interpretation of Liver Function Tests (Lantern Demonstration) EDWIN E OSGOOD Portland Ore.

Diagnosis of and Therapeutic Agents Used in Liver Disease

Diagnostic Handling of Patients with Jaundice (Lantern Demonstration) THEODORE L ALTHAUSEN and JOSEPH E GIANSIRACUSA, San Francisco

Needle Biopsy of the Liver (Lantern Demonstration) FREDERICK W HOFFBAUER Minneapolis

A Review of the Medical Agents (Lantern Demonstration) DWIGHT L WILBUR, San Francisco

Epidemic Hepatitis

Etiology (Lantern Demonstration) W PAUL HAVENS JR New Haven, Conn

Clinical and Laboratory Diagnosis RICHARD B CAPPS Chicago CAPTAIN VICTOR M SHOROV, Medical Corps Army of the United States, and M HERBERT BARKER Chicago

Pathology (Lantern Demonstration) TRACY B MALLORY Boston

Delayed Recovery from Acute Infectious Hepatitis Analysis of Its Causes and the Clinical Significance of Residuals CAPTAIN EMANUEL M RAPPAPORT Medical Corps Army of the United States, and MAJOR GERALD KLATSKIN, Medical Corps Army of the United States

Cirrhosis of the Liver

Its Relation to Hepatitis (Lantern Demonstration) STOCKTON KIMBALL WILLIAM A C CHAPPLE and SAMUEL SAXES, Buffalo

Alcoholic Cirrhosis RUSSELL S BOLES ROBERT S CREW and WILLIAM DUNBAR Philadelphia

New Methods of Therapy in Cirrhosis of the Liver (Lantern Demonstration) LESTER M MORRISON Los Angeles

Discussion to be opened by CECIL J WATSON, Minneapolis

## SECTION ON NERVOUS AND MENTAL DISEASES

MEETS IN WAR MEMORIAL OPERA HOUSE BUFFET

### OFFICERS OF SECTION

Chairman—PERCIVAL BAILEY, Chicago

Vice Chairman—H HOUSTON MERRITT, Boston

Secretary—R P MACKAY, Chicago

Executive Committee—STANLEY COBB Boston, J M NIELSEN, Los Angeles, PERCIVAL BAILEY, Chicago

### Wednesday, July 3—9 a m.

Rheumatic Brain Disease Late Sequel of Rheumatic Fever (Lantern Demonstration) WALTER L BRUETSCH, Indianapolis

Discussion to be opened by FREDERICK P MOERSCH, Rochester, Minn, and NATHAN MALAMUD, San Francisco

Reflex Sympathetic Dystrophy (Lantern Demonstration) JAMES A EVANS, Boston

Discussion to be opened by GEZA DE TAKATS, Chicago, and CAPTAIN W K. LIVINGSTON (MC) U S N R.

Complications of Penicillin Therapy in Meningitis and Brain Abscess (Lantern Demonstration) THEODORE C ERICKSON and MABEL G MASTEN, Madison, Wis

Periodic Ataxia (Lantern and Motion Picture Demonstration) HARRY LEE PARKER, Rochester Minn

Discussion to be opened by JOHN B DOYLE, Los Angeles

Surgical Aspects of Traumatic Subdural Hematoma (Lantern Demonstration) HAROLD C VORIS Chicago

Discussion to be opened by A. W ADSON, Rochester, Minn.

Spontaneous Regeneration of Severed Peripheral Nerves (Lantern Demonstration)

LEWIS J POLLOCK and JAMES G GOLSETH Chicago, FRANK H MAYFIELD Cincinnati, ALEX J ARIEFF, Chicago, CAPTAIN Y T OESTER, Medical Corps Army of the United States and ERICH LIEBERT Chicago

Discussion to be opened by HOWARD C NAFFZIGER, San Francisco

### Thursday, July 4—9 a m

**Election of Officers**

*SYMPOSIUM ON TROPICAL DISEASES*

Neurologic Complications of Diphtheritic Neuritis HERBERT S GASKILL Philadelphia

Discussion to be opened by ROBERT B AIRD San Francisco

Cerebral Manifestations During the Course of Malaria Experience in Mediterranean Theater World War II (Lantern Demonstration) BENJAMIN BOSHES Chicago

Discussion to be opened by W McD HAMMON San Francisco

Emotional Reactions to Schistosomiasis MAJOR JEROME D FRANK Medical Corps, Army of the United States

Psychoneurosis and Industry WALTER F SCHALLER, San Francisco

Discussion to be opened by ISRAEL S WECHSLER and FOSTER KENNEDY New York

Electrocerebral Shock Therapy A Reconsideration of Former Contraindications (Lantern Demonstration) MATTHEW T MOORE Philadelphia

Discussion to be opened by LOTHAR B KALINOWSKY New York, and NATHANIEL W WINKELMAN, Philadelphia

### Friday, July 5—9 a m

JOINT MEETING WITH SECTION ON OPHTHALMOLOGY IN WAR MEMORIAL VETERANS BUILDING AUDITORIUM

Chairman's Address The Practice of Neurology in the U S A (Lantern Demonstration) PERCIVAL BAILEY, Chicago

Present Trends in the Practice of Neurology GEORGE WILSON and CHARLES RUPP, Philadelphia

Discussion to be opened by J M NIELSEN and JOHN B DOYLE, Los Angeles

Ocular Manifestations of Psychosomatic Disorders
DAVID O HARRINGTON, San Francisco
Discussion to be opened by GEORGE STUART CAMPION, San Francisco, and MEYER A ZELIGS, Oakland, Calif
The Surgical Problem of Intracranial Aneurysm and Allied Vascular Lesions (Lantern Demonstration)
JOHN MARTIN, Chicago
Discussion to be opened by JOHN E RAAF, Portland, Ore, and HALE A HAVEN, Seattle
Visual Field Changes Confirmed by Pathologic Diagnosis (Lantern Demonstration) DONALD J LYLE, Cincinnati
Discussion to be opened by CAPTAIN JOHN S MCGAVIC, Medical Corps, Army of the United States, and P J LEINFELDER, Iowa City
Management of Patients with Chronic Headache (Lantern Demonstration)
ARNOLD P FRIEDMAN, CHARLES BRENNER and H HOUSTON MERRITT, New York
Discussion to be opened by CHARLES D ARING, Cincinnati, and J M NIELSEN, Los Angeles

## SECTION ON DERMATOLOGY AND SYPHILOLOGY

MEETS IN WAR MEMORIAL VETERANS BUILDING ROOM 1

### OFFICERS OF SECTION

Chairman—CLYDE L CUMMER, Cleveland
Vice Chairman—DUDLEY C SMITH, Charlottesville, Va
Secretary—NELSON PAUL ANDERSON, Los Angeles
Executive Committee—C F LEHMANN, San Antonio Texas, CLARK W FINNERUD, Chicago, CLYDE L CUMMER, Cleveland

### Wednesday, July 3—9 a m

Chairman's Address Leukoplakia (Leukokeratosis) of the Palate (Lantern Demonstration)
CLYDE L CUMMER, Cleveland
The Treatment of Malignant and Benign Skin Lesions by the Topical Application of Radioactive Phosphorus (Lantern Demonstration)
BERTRAM V A LOW-BEER, San Francisco
Discussion to be opened by C GUY LANE, Boston, and HIRAM E MILLER, San Francisco
The Treatment of Basal Cell Epithelioma by the Injection of Tissue Extracts (Lantern Demonstration)
JOSEPH C AMERSBACH, New York
Discussion to be opened by S WILLIAM BECKER, Chicago, and CLYDE K EMERY, Los Angeles
Actinomycosis of the Face and Neck (Lantern Demonstration)
JOHN H LAMB and EVERETT S LAIN, Oklahoma City
Discussion to be opened by GEORGE M LEWIS, New York, and FRED D WEIDMAN, Philadelphia
Chronic Familial Porphyria with Photosensitivity (Lantern Demonstration)
LOUIS A BRUNSTING and HAROLD L MASON, Rochester, Minn
Discussion to be opened by CLEVELAND J WHITE, Chicago, and MAXIMILIAN E OBERMAYER, Los Angeles
The Cutaneous Lesions in Meningococcemia A Clinical and Pathologic Study (Lantern Demonstration)
WILLIAM R HILL JR and THOMAS D KINNEY, Boston
Discussion to be opened by MAURICE J COSTELLO, New York

### Thursday, July 4—9 a m

**Election of Officers**

A New Development Toward a Single Standard Blood Test for Syphilis (Lantern Demonstration)
BENJAMIN S KLINE Cleveland
Discussion to be opened by JOHN F MAHONEY, Stapleton, N Y, and M H MERRILL, Berkeley, Calif
Results of Treatment of Early Syphilis with Penicillin
LIEUTENANT COLONEL THOMAS H STERNBERG, Medical Corps, Army of the United States, and WILLIAM LEIFER, New York.
Discussion to be opened by ARTHUR G SCHOCH, Dallas, Texas, and GRANT MORROW, San Francisco
The Treatment of Early Syphilis by a Single Daily Intramuscular Injection of Calcium Penicillin in Beeswax and Peanut Oil (Lantern Demonstration)
CAPTAIN MONROE J ROMANSKY, Medical Corps, Army of the United States and CHARLES R REIN, New York
Discussion to be opened by D R NICHOLS, Rochester, Minn, and GEORGE V KULCHAR, San Francisco
Penicillin Therapy in Neurosyphilis (Lantern Demonstration)
AUGUSTUS S ROSE and HARRY C SOLOMON, Boston.
Discussion to be opened by PAUL A O'LEARY, Rochester, Minn and NORMAN N EPSTEIN, San Francisco
Penicillin Therapy in Early Congenital Syphilis (Lantern Demonstration) R V PLATOU, New Orleans
Discussion to be opened by ARILD E HANSEN, Galveston, Texas
Toxic Reactions Accompanying Penicillin Therapy (Lantern Demonstration)
CAPTAIN WILLIAM J MORGINSON, Medical Corps, Army of the United States
Discussion to be opened by HAROLD M JOHNSON Honolulu, Hawaii, and CHARLES W BARNETT, San Francisco
The Uses of "Bal," with Particular Reference to Arsenical Dermatitis (Lantern Demonstration)
MARION B SULZBERGER and RUDOLF L BAER, New York.
Discussion to be opened by JULIUS R SCHOLTZ, Los Angeles

### Friday, July 5—9 a m

Atabrine Dermatitis THOMAS W NISBET, Pasadena, Calif
Discussion to be opened by FREDERICK G NOVY JR, Oakland, Calif, and JAMES R DRAKE, San Francisco
An Unusual Form of Cutaneous Reaction Following Sulfonamide Therapy OSGOODE S PHILPOTT, Denver
Discussion to be opened by J BEDFORD SHELMIRE, Dallas, Texas, and STUART C WAY, San Francisco
Histoplasmosis A Review of Cutaneous and Adjacent Mucous Membrane Manifestations, with a Report of Three Cases (Lantern Demonstration)
ARTHUR C CURTIS, Ann Arbor, Mich, and JOHN N GREKIN, U S P H S
Discussion to be opened by CARL W LAYMON, Minneapolis, and JOHN F KESSEL, Los Angeles
Furacin Therapy (Lantern Demonstration)
JOHN G DOWNING, Boston.
Discussion to be opened by J GARDNER HOPKINS, New York and FRANCIS W LYNCH, St Paul
Correlation of the Boiling Ranges of Some Petroleum Solvents with Their Irritant Action on the Skin (Lantern Demonstration)
JOSEPH V KLAUDER and FRED BRILL, Philadelphia.
Discussion to be opened by LOUIS SCHWARTZ Bethesda, Md, and HARRY J TEMPLETON, Oakland, Calif
Cutaneous Manifestations of Monocytic Leukemia.
W R HUBLER and E W NETHERTON, Cleveland.
Discussion to be opened by HARRY L ARNOLD JR, Honolulu, Hawaii, and LOUIE H WINER, Beverly Hills, Calif

## SECTION ON PREVENTIVE AND INDUSTRIAL MEDICINE AND PUBLIC HEALTH

MEETS IN HIGH SCHOOL OF COMMERCE, GIRLS' GYMNASIUM

### OFFICERS OF SECTION

Chairman—E. L STEBBINS, New York
Vice Chairman—C O SAPPINGTON, Chicago
Secretary—W A SAWYER, Rochester, N Y

### Wednesday, July 3—2 p m

The Maryland Medical Care Program R H RILEY, Baltimore
Effect of Season and Dust Control on Coccidioidomycosis (Lantern Demonstration)
C E SMITH and R R BEARD, San Francisco, CAPTAIN H G ROSENBERGER, Medical Corps, Army of the United States, and E G WHITING, San Francisco
Dysentery Vaccines Prepared by Ultraviolet Irradiation (Lantern Demonstration)
H J SHAUGHNESSY and SIDNEY O LEVINSON, Chicago
Poliomyelitis—1943, 1944, 1945 (Lantern Demonstration)
E A PISZCZEK, Chicago
Rapid Treatment of Early Syphilis (Lantern Demonstration)
J R HELLER JR, U S P H S

### Thursday, July 4—2 p m

**Election of Officers**

Importance of Physical Medicine in Public Health, with Particular Reference to Physical Therapy in Poliomyelitis and Cerebral Palsy (Lantern Demonstration)
ROBERT L BENNETT JR, Warm Springs, Ga.

Constructive Medicine R C PAGE, New York.

Study of 3,000 Pneumonia Cases in Shipyard Workers
MORRIS F COLLEN, Oakland Calif

Industrial Physical Examinations Objectives and Methods
FENN E POOLE, Los Angeles

The Doctor's Responsibility for Industrial Nursing
OLIVE WHITLOCK KLUMP Los Angeles

## SECTION ON UROLOGY

MEETS IN WAR MEMORIAL VETERANS BUILDING ROOM 1

### OFFICERS OF SECTION

Chairman—ARBOR D MUNGER, Lincoln, Neb

Vice Chairman—LLOYD G LEWIS Washington, D C.

Secretary—GRAYSON L CARROLL, St Louis

Executive Committee—VINCENT J O'CONOR, Chicago COMMANDER GERSHOM J THOMPSON (MC), U S N R ARBOR D MUNGER, Lincoln, Neb

### Wednesday, July 3—2 p m

Incidence of Urinary Calculi in the American Negro
AUSTIN I DODSON and JOHN R CLARK Richmond Va

Management of Ureteral Stones
MILO ELLIK, Long Beach Calif
Discussion to be opened by THOMAS E GIBSON San Francisco

Intestinovesical Fistula (Lantern Demonstration)
ROGER W BARNES and MALCOLM R. HILL Los Angeles
Discussion to be opened by JOHN H MORRISSEY New York and ROBERT A SCARBOROUGH, San Francisco

*SYMPOSIUM ON URINARY VESICAL TUMORS*

Infiltrating Carcinoma of the Bladder Application of Pathology to Clinical Diagnosis and Prognosis (Lantern Demonstration) HUGH J JEWETT, Baltimore

Endoscopic Treatment of Bladder Tumors (Lantern Demonstration) HAROLD P McDONALD Atlanta Ga

Results of Treatment by Surgical Removal vs Irradiation (Lantern Demonstration) VICTOR F MARSHALL, New York.

Surgical Treatment of Bladder Tumors (Lantern Demonstration) JAMES T PRIESTLEY Rochester Minn
Discussion on papers of DRS JEWETT McDONALD MARSHALL and PRIESTLEY to be opened by FRANK HINMAN San Francisco, and OSWALD S LOWSLEY, New York

### Thursday, July 4—2 p m.

**Election of Officers**

Urologic Complications in Spinal Cord Injuries
LIEUTENANT COMMANDER HERMON C BUMPUS (MC) U S N R. LIEUTENANT COMMANDER MYRON H NOURSE (MC), U S N, and COMMANDER GERSHOM J THOMPSON (MC), U S N R

End Results Following Nephrectomy in Hypertensive Patients (Lantern Demonstration)
REED M NESBIT and RIGDON K RATLIFF Ann Arbor, Mich
Discussion to be opened by WILLIAM J McMARTIN, Omaha, and ALFRED I FOLSOM Dallas Texas

Chairman's Address A Plea for a More Conservative Attitude in Kidney Surgery (Lantern Demonstration)
ARBOR D MUNGER, Lincoln Neb

Streptomycin in the Treatment of Tuberculosis of the Urinary Bladder (Lantern Demonstration)
FRANCIS H REDEWILL, San Francisco

Urinary Antiseptics, Including Penicillin and Streptomycin in Infections of the Urinary Tract.
EDWARD N COOK, and THOMAS L POOL, Rochester Minn

Streptomycin for Urinary Tract Infections
JOHN D ADCOCK Ann Arbor Mich

### Friday, July 5—2 p m

A New Method and Device for Care of Nocturnal Enuresis (Lantern Demonstration)
FREDERIC E B FOLEY, St. Paul

Radical Perineal Prostatectomy for Carcinoma (Lantern Demonstration) JOHN K ORMOND Detroit.

Fertility Studies of the Male in Barren Marriages An Analysis of 850 Cases (Lantern Demonstration)
LEWIS MICHELSON and ROBIN P MICHELSON San Francisco
Discussion to be opened by ROBERT S HOTCHKISS New York

Androgen Therapy in Prostatic Disease (Lantern Demonstration) FRANKLIN FARMAN Los Angeles
Discussion to be opened by WILLIAM P HERBST Washington, D C

Renal Crush Syndrome (Lantern Demonstration)
SAMUEL A VEST Charlottesville Va

## SECTION ON ORTHOPEDIC SURGERY

MEETS IN WAR MEMORIAL OPERA HOUSE BUFFET

### OFFICERS OF SECTION

Chairman—THEODORE A WILLIS Cleveland

Vice Chairman—FRANCIS M McKEEVER, Los Angeles

Secretary—J WARREN WHITE, Greenville, S C.

Executive Committee—JAMES A DICKSON, Cleveland GUY A CALDWELL, New Orleans, THEODORE A WILLIS, Cleveland

### Wednesday, July 3—2 p m

Ambulatory Treatment of Hallux Valgus (Lantern Demonstration)
EDWARD L COMPERE and WILLIAM J SCHNUTE Chicago
Discussion to be opened by SYLVAN L HAAS, San Francisco, and ROBERT G PACKARD, Denver

Intocostrin in Acute Anterior Poliomyelitis
NICHOLAS S RANSOHOFF, New York

An Ambulatory Splint for the Treatment of Cervical Spine Injuries (Lantern Demonstration)
FREDERIC C BOST, San Francisco
Discussion to be opened by OSCAR L. MILLER, Charlotte N C, and RUDOLPH L DRESEL, San Francisco

Trochanteric Osteotomies in Poliomyelitis (Lantern Demonstration) C. E IRWIN, Warm Springs, Ga
Discussion to be opened by CHARLES L LOWMAN, Los Angeles and LEROY C ABBOTT, San Francisco

Conservative Treatment of Low Back Pain Including Suspected Disk Lesions EUGENE M REGEN, Nashville Tenn
Discussion to be opened by GEORGE J GARCEAU, Indianapolis, and JOHN DUNLOP Pasadena, Calif

### Thursday, July 4—2 p m

**Election of Officers**

Farm Injuries (Lantern Demonstration)
RALPH K GHORMLEY and H H YOUNG, Rochester, Minn
Discussion to be opened by H H HITCHCOCK, Oakland, Calif and STEELE F STEWART, Honolulu, Hawaii

Chairman's Address THEODORE A WILLIS, Cleveland

The Use of Small Threaded Wires in the Treatment of Fractures (Lantern Demonstration)
H RELTON McCARROLL St. Louis
Discussion to be opened by DONALD E. KING, San Francisco and FRANCIS M McKEEVER, Los Angeles

Solid Blast Injuries (Lantern Demonstration)
JOSEPH S BARR Boston
Discussion to be opened by LIEUTENANT COLONEL JOSEPH E MILGRAM, Medical Corps, Army of the United States and CAPTAIN WILLIAM L ROGERS (MC), U S N R

### Friday, July 5—9 a m

JOINT MEETING WITH SECTION ON ANESTHESIOLOGY

The Use of Local Anesthesia on Spinal Fusions in Children
J H KITE Atlanta Ga
Discussion to be opened by J JOSEPH MATTES, Seattle and LIEUTENANT CHARLES C WYCOFF, Medical Corps, Army of the United States

Refrigeration Anesthesia (Lantern Demonstration)
LYMAN WEEKS CROSSMAN, New York
Discussion to be opened by JOHN A STILES, San Francisco, and BRUCE M ANDERSON, Oakland, Calif

Various Anesthetics in Orthopedic Surgery
B B SANKEY, East Cleveland, Ohio
Discussion to be opened by JOSEPH A FREIBERG, Cincinnati, WALTER G STUCK, San Antonio, Texas, and FRANCIS M McKEEVER, Los Angeles

Neurologic Complications of Spinal Anesthesia
M J NICHOLSON and URBAN H EVERSOLE, Boston
Discussion to be opened by DAVID M BOSWORTH, New York, and J ARCHER O'REILLY, St Louis

## SECTION ON GASTRO-ENTEROLOGY AND PROCTOLOGY

MEETS IN HIGH SCHOOL OF COMMERCE, GIRLS' GYMNASIUM

### OFFICERS OF SECTION

Chairman—J A BARGEN, Rochester, Minn
Vice Chairman—MARTIN S KLECKNER, Allentown, Pa
Secretary—SARA M JORDAN, Boston
Executive Committee—WALTER L PALMER, Chicago, EMMETT H TERRELL, Richmond, Va, J A BARGEN, Rochester, Minn

### Wednesday, July 3—9 a m

Histamine in the Therapy of Peptic Ulcer
BENJAMIN M BERNSTEIN, Brooklyn
Discussion to be opened by A C IVY, Chicago

Peptic Ulcer in the Aged (Lantern Demonstration)
EVERETT D KIEFER and DAVID McC McKELL JR, Boston
Discussion to be opened by WILLIAM C BOECK, Los Angeles

Relative Importance of Acid and Pepsin in Production of Experimental Gastric Ulcers in the Rat, with an Evaluation of Some Antacid and Antipeptic Agents (Lantern Demonstration)
HARRY SHAY and S A KOMAROV, Philadelphia
Discussion to be opened by JOHN H FITZGIBBON, Portland, Ore

Troublesome Symptoms Following Gastric Operations, with Special Reference to Carbohydrate Ingestion (Lantern Demonstration)
ROBERT M ZOLLINGER, Columbus, Ohio, and STANLEY O HOERR, Boston
Discussion to be opened by H GLENN BELL, San Francisco

Partial Gastrectomy versus Palliative Resection in the Surgical Treatment of Duodenal Ulcers (Lantern Demonstration)
RICHARD LEWISOHN, New York
Discussion to be opened by FRANK H LAHEY, Boston

The Diagnosis and Treatment of Cardiospasm (Lantern Demonstration) PORTER P VINSON, Richmond, Va
Discussion to be opened by GUNTHER W NAGEL, San Francisco

Cerebral Dysrhythmias Associated with Gastrointestinal Syndromes (Lantern Demonstration)
HARRY L SEGAL and HENRY A BLAIR, Rochester, N Y
Discussion to be opened by MATTHEW T MOORE, Philadelphia

Clinical and Pathologic Studies in Sprue (Lantern Demonstration)
DAVID ADLERSBERG and JOSEPH T SCHEIN, New York.
Discussion to be opened by GEORGE BAEHR, New York

Unusual (Benign) Hematemesis Gastric Telangiectatic Dysplasia, Review of Literature and Case Reports, Rendu-Osler-Weber's Disease (Lantern Demonstration)
HYMAN I GOLDSTEIN, Camden, N J
Discussion to be opened by FELIX CUNHA, San Francisco

The Annual Banquet of the section will be held Wednesday, July 3, at 7 p m. at the Whitcomb Hotel

### Thursday, July 4—9 a m.

Election of Officers

Chairman's Address Newer Concepts of Intestinal Function (Lantern Demonstration)
J A BARGEN, Rochester, Minn

Intestinal Dysfunction
The Roentgenologic Contribution to the Diagnosis of Functional Intestinal States (Lantern Demonstration)
HENRY M WEBER, Rochester, Minn.
Treatment of Intestinal Conditions as Based on Disordered Functions
DONOVAN C BROWNE, New Orleans
Discussion to be opened by SARA M JORDAN, Boston.

Diverticulosis and Diverticulitis of the Colon in Young Persons
CARL BEARSE, Boston.
Discussion to be opened by REGINALD FITZ, Boston.

Intestinal Tumors of Dysentery Origin (Lantern Demonstration)
DANIEL N SILVERMAN and ALAN N LESLIE, New Orleans
Discussion to be opened by RUSSELL S BOLES, Philadelphia.

Proctologic Interpretation and Treatment of Chronic Ulcerative Colitis (Lantern Demonstration)
MARTIN S KLECKNER, Allentown, Pa.
Discussion to be opened by A W MARTIN MARINO, Brooklyn

Segmental Colitis (Lantern Demonstration)
BURRILL B CROHN, JOHN H GARLOCK and HARRY YARNIS, New York
Discussion to be opened by J A BARGEN, Rochester, Minn

Clinical, Chemical and Bacteriologic Evaluation of Oral Penicillin in Chronic Ulcerative Colitis (Lantern Demonstration) MICHAEL H STREICHER, Chicago
Discussion to be opened by THEODORE L ALTHAUSEN, San Francisco

The Causes and Management of Anemia Associated with Chronic Ulcerative Colitis (Lantern Demonstration)
H MARVIN POLLARD and MALCOLM BLOCK, Ann Arbor, Mich
Discussion to be opened by EVERETT D KIEFER, Boston.

Pilonidal Disease Present Status of Surgical Treatment (Lantern Demonstration)
CURTICE ROSSER and JACK G KERR, Dallas, Texas
Discussion to be opened by WALTER A FANSLER, Minneapolis

### Friday, July 5—9 a m.

JOINT MEETING WITH SECTION ON PATHOLOGY AND PHYSIOLOGY

*SYMPOSIUM ON DISEASES OF THE LIVER*

Physiology of Liver Disease
Application of Modern Physiologic Concepts to Treatment of Disease of the Liver
JAMES F WEIR, Rochester, Minn.
Interpretation of Liver Function Tests
EDWIN E OSGOOD, Portland, Ore.

Diagnosis of and Therapeutic Agents Used in Liver Disease
Diagnostic Handling of Patients with Jaundice (Lantern Demonstration)
THEODORE L ALTHAUSEN and JOSEPH E. GIANSIRACUSA, San Francisco
Needle Biopsy of the Liver (Lantern Demonstration)
FREDERICK W HOFFBAUER, Minneapolis
A Review of the Medical Agents
DWIGHT L WILBUR, San Francisco

Epidemic Hepatitis
Etiology (Lantern Demonstration)
W PAUL HAVENS JR, New Haven, Conn.
Clinical and Laboratory Diagnosis
RICHARD B CAPPS, Chicago CAPTAIN VICTOR M SBOROV, Medical Corps, Army of the United States, and M HERBERT BARKER, Chicago.
Pathology (Lantern Demonstration)
TRACY B MALLORY, Boston.
Delayed Recovery from Acute Infectious Hepatitis Analysis of Its Causes and the Clinical Significance of Residuals
CAPTAIN EMANUEL M RAPPAPORT, Medical Corps, Army of the United States, and MAJOR GERALD KLATSKIN, Medical Corps, Army of the United States

Cirrhosis of the Liver
Its Relation to Hepatitis (Lantern Demonstration)
STOCKTON KIMBALL, WILLIAM A. C. CHAPPLE and SAMUEL SANES, Buffalo
Alcoholic Cirrhosis
RUSSELL S. BOLES, ROBERT S. CREW and WILLIAM DUNBAR, Philadelphia
New Methods of Therapy in Cirrhosis of the Liver
LESTER M. MORRISON, Los Angeles
Discussion to be opened by CECIL J. WATSON, Minneapolis

## SECTION ON RADIOLOGY

MEETS IN WAR MEMORIAL VETERANS BUILDING ROOM 223

### OFFICERS OF SECTION

Chairman—EDWIN C. ERNST, St. Louis
Vice Chairman—BARNARD P. WIDMANN, Philadelphia.
Secretary—U. V. PORTMANN, Cleveland
Executive Committee—RALPH S. BROMER, Bryn Mawr, Pa., ROBERT A. ARENS, Chicago, EDWIN C. ERNST, St. Louis

### Wednesday, July 3—9 a. m.

A Comparison of the Effectiveness for Tuberculosis Case Finding of Various Roentgenographic and Photofluorographic Methods
W. EDWARD CHAMBERLAIN, Philadelphia, CARL C. BIRKELO, Detroit, PAUL S. PHELPS, Hartford, Conn., PERCY E. SCHOOLS, Richmond, Va., JOSEPH YERUSHALMY, Washington, D. C., and DAVID ZACKS, Boston

Nontuberculous Pulmonary Calcification and Histoplasmin Sensitivity. HENRY B. ZWERLING, Berkeley, Calif.

Roentgenographic Diagnosis of Virus Pneumonia
MAURICE D. SACHS, San Francisco

The Diagnosis of Carcinoma of the Stomach by Chest Roentgenography (Lantern Demonstration)
B. R. KIRKLIN and EVA L. GILBERTSON, Rochester, Minn.

Epicardial Fat Shadows in Differential Diagnosis (Lantern Demonstration)
FRED J. HODGES and JOHN F. HOLT, Ann Arbor, Mich.

### Thursday, July 4—9 a. m.

**Election of Officers**

Chairman's Address: Mandibular Joint Syndrome.
EDWIN C. ERNST, St. Louis

Changes in Roentgenologic Diagnostic Criteria Resulting from Chemotherapy (Lantern Demonstration)
ARTHUR C. CHRISTIE and GEORGE M. WYATT, Washington, D. C.

Irradiation for Cancer of the Face, Mouth and Metastatic Cervical Lymph Nodes (Lantern Demonstration)
CHARLES L. MARTIN and CARLETON C. WRIGHT, Dallas, Texas

The Cancer Problem and Nuclear Physics (Lantern Demonstration)
PAUL C. HODGES and RUSSELL H. MORGAN, Chicago

### Friday, July 5—9 a. m.

JOINT MEETING WITH SECTION ON LARYNGOLOGY, OTOLOGY AND RHINOLOGY

Radium Treatment of Hyperplastic Lymphoid Tissue in the Nasopharynx. EDWARD M. WALZL, Baltimore
Discussion to be opened by H. A. FLETCHER, San Francisco, and J. S. MIKELL, Tucson, Ariz.

Supervoltage Roentgen Therapy for Carcinoma of the Esophagus
FRANZ J. BUSCHKE and SIMEON T. CANTRIL, Seattle

Roentgen Therapy for Carcinoma of the Larynx (Lantern Demonstration). MAURICE LENZ, New York.

Surgical Management of Carcinoma of the Larynx.
SIMON JESBERG, Los Angeles
Discussion to be opened by ORVILLE N. MELAND, Los Angeles, and JULIUS A. WEBER, Seattle

Surgical Aspects of Bronchogenic Carcinoma (Lantern Demonstration). JOHN C. JONES, Los Angeles

## SECTION ON ANESTHESIOLOGY

MEETS IN WAR MEMORIAL VETERANS BUILDING ROOM 223

### OFFICERS OF SECTION

Chairman—ANSEL M. CAINE, New Orleans
Vice Chairman—HAROLD C. KELLEY, New York.
Secretary—JOHN S. LUNDY, Rochester, Minn.
Executive Committee—THOMAS J. COLLIER, Atlanta, Ga., PAUL M. WOOD, New York, ANSEL M. CAINE, New Orleans

### Wednesday, July 3—2 p. m.

**Business Meeting for Presenting Resolutions**

*SYMPOSIUM ON MILITARY ANESTHESIA IN WORLD WAR II*

Program of United States Navy. Introduced by VICE ADMIRAL ROSS T. MCINTIRE (MC), U.S.N.

Wartime Anesthesia in United States Navy (Lantern Demonstration). CAPTAIN DONALD E. HALE (MC), U.S.N.R.
Discussion to be opened by LIEUTENANT COMMANDER JOSEPH T. TROTTER, JR. (MC), U.S.N.R.

Remarks by ROGER I. LEE, President, American Medical Association.

Program of United States Army. Introduced by MAJOR GENERAL NORMAN T. KIRK, Medical Corps, United States Army

The Problems of the Consultant in Anesthesia for the European Theater of Operations (Lantern Demonstration)
COLONEL RALPH M. TOVELL, Medical Corps, Army of the United States
Discussion to be opened by F. E. DAVIS, Medical Corps, Army of the United States

The Problems of Anesthesiology Consultant for the Pacific Ocean Areas
LIEUTENANT COLONEL C. F. MCCUSKEY, Medical Corps, Army of the United States
Discussion to be opened by MAJOR THOMAS A. BRODERICK, Medical Corps, Army of the United States, and MAJOR FORREST E. LEFFINGWELL, Medical Corps, Army of the United States

Lessons Learned from Resuscitation of Wounded Soldiers That Are Applicable to Civilian Practice (Lantern Demonstration)
LIEUTENANT COLONEL HENRY K. BEECHER, Medical Corps, Army of the United States
Discussion to be opened by MAJOR MALCOLM H. HAWK, Medical Corps, Army of the United States

Anesthesia for Thoracic Surgery in the Zone of the Interior
LIEUTENANT COLONEL LLOYD H. MOUSEL, Medical Corps, Army of the United States
Discussion to be opened by MAJOR ERNEST W. WARNOCK, Medical Corps, Army of the United States, and MAJOR GORDON C. LANGSDORF, Medical Corps, Army of the United States

### Thursday, July 4—2 p. m.

**Election of Officers**

Chairman's Address: Group Practice of Anesthesiology
ANSEL M. CAINE, New Orleans

*SYMPOSIUM ON CURARE*

Effects of Curare on Tissue Respiration (Lantern Demonstration)
ROBERT M. FEATHERSTONE and E. G. GROSS, Iowa City

The Use of Curare in Infants and Children (Lantern Demonstration). SCOTT M. SMITH, Salt Lake City

The Physiologic Effects of Curare and Its Use as an Adjunct to Anesthesia (Lantern Demonstration)
PHYLLIS HARROUN, San Francisco
Discussion on papers of DRS. FEATHERSTONE and GROSS, DR. SMITH and DR. HARROUN to be opened by STUART C. CULLEN, Iowa City, and WILLIAM B. NEFF, San Francisco

The Subarachnoid Use of Vasoconstrictors in Spinal Anesthesia
R. J. WHITACRE and J. K. POTTER, East Cleveland, Ohio
Discussion to be opened by CURTISS B. HICKCOX, Philadelphia, and JOHN ADRIANI, New Orleans

Use of Amnesia in Obstetric Patients
PERRY P VOLPITTO, Augusta, Ga
Discussion to be opened by JOHN A MOFFITT, Los Angeles, and WALTER LAWRENCE, San Francisco

**Friday, July 5—9 a. m**

JOINT MEETING WITH SECTION ON ORTHOPEDIC SURGERY
IN WAR MEMORIAL OPERA HOUSE BUFFET

The Use of Local Anesthesia on Spinal Fusions in Children
J H KITE, Atlanta, Ga
Discussion to be opened by J JOSEPH MATTES, Seattle, and LIEUTENANT CHARLES C WYCOFF, Medical Corps, Army of the United States

Refrigeration Anesthesia (Lantern Demonstration)
LYMAN WEEKS CROSSMAN, New York
Discussion to be opened by JOHN A STILES San Francisco, and BRUCE M ANDERSON, Oakland, Calif

Various Anesthetics in Orthopedic Surgery
B B SANKEY, East Cleveland, Ohio
Discussion to be opened by JOSEPH A FREIBERG, Cincinnati, WALTER G STUCK, San Antonio, Texas, and FRANCIS M McKEEVER, Los Angeles

Neurologic Complications of Spinal Anesthesia
M J NICHOLSON and URBAN H EVERSOLE, Boston
Discussion to be opened by DAVID M BOSWORTH, New York, and J ARCHER O'REILLY, St Louis

## SECTION ON GENERAL PRACTICE OF MEDICINE

MEETS IN MASONIC TEMPLE AUDITORIUM

### OFFICERS OF SECTION

Chairman—WINGATE M JOHNSON, Winston-Salem, N C
Secretary—W B HARM, Detroit

**Wednesday, July 3—9 a m**

Chairman's Address Will General Practice Survive?
WINGATE M JOHNSON, Winston-Salem, N C

The Present Status of Gelatin Sponge as a Hemostatic Agent (Lantern and Motion Picture Demonstration)
HILGER PERRY JENKINS, Chicago

Laboratory Tests in General Practice (Lantern Demonstration)
DONALD H KAUMP, Detroit

Dislocations
J J CALLAHAN, Chicago

The Diagnosis and Treatment of Early Deficiency Diseases (Lantern Demonstration)
DAVID CAYER, Winston-Salem, N C

The Physiology of Spermatogenesis and Treatment of Male Infertility
EDWARD T TYLER, Los Angeles

**Thursday, July 4—9 a m**

**Election of Officers**

The Male Climacteric (Lantern Demonstration)
AUGUST A WERNER, St Louis

How Long Does the Patient with Angina Pectoris Due to Coronary Sclerosis Live (Lantern Demonstration)?
THOMAS J DRY, Rochester, Minn.

The "Acute Abdomen" as It Applies to the General Practitioner
G LAWRENCE CHAFFIN, Los Angeles

Psychoneurosis Its Significance in General Practice
RAYMOND W WAGGONER, Ann Arbor, Mich

Bile Physiology and Therapy (Lantern Demonstration)
E J TEETER, Indianapolis

**Friday, July 5—9 a m**

JOINT MEETING WITH SECTION ON OBSTETRICS AND GYNECOLOGY

The Nervous Pathways Involved in Pelvic Pain (Lantern Demonstration)
ROBERT D MUSSEY and ROBERT B WILSON, Rochester, Minn

Psychosomatic Aspects of Pelvic Pain
WILBUR R MILLER, Iowa City

Urinary Tract in Pelvic Pain from the Standpoint of the Gynecologist (Lantern Demonstration)
R GLENN CRAIG, San Francisco

Orthopedic Causes of Pelvic Pain (Lantern Demonstration)
HORACE C PITKIN, San Francisco

Deviations of Myometrial Physiology as Cause of Pelvic Pain (Lantern Demonstration)
RICHARD TORPIN R A. WOODBURY, G F CHILD, W G WATSON and LOUISE JARBOE, Augusta, Ga.

# THE SCIENTIFIC EXHIBIT

The Scientific Exhibit will be located in the Civic Auditorium, occupying Polk Hall and corridors on the first and second floors

Special exhibits include fractures and physical medicine, in both of which demonstrations will be carried on throughout the week by a large number of physicians

The United States Army and the United States Navy will present extensive displays depicting the achievements of medicine during World War II

The seventeen sections of the Scientific Assembly have arranged groups of exhibits dealing with the various specialties of medicine All exhibits, however, are presented for the physician in general practice rather than for the specialist

The most significant motion pictures produced in 1945 and 1946 will be shown in several motion picture theaters in the Veterans Building, which is in close proximity to the Civic Auditorium In addition to films produced by physicians there will be a large number of motion pictures shown under the auspices of both the Army and the Navy in theaters in the Veterans Building as well as a group of pictures dealing with physical therapy, occupational therapy and rehabilitation shown in conjunction with the special exhibit on physical medicine in the Civic Auditorium

Admission to the Scientific Exhibit will be limited to persons wearing the Fellowship badge or other official badge of the convention The public will not be admitted to the Scientific Exhibit.

## SPECIAL EXHIBITS

The Committee on Scientific Exhibit of the Board of Trustees is sponsoring two special exhibits—one on fractures and the other on physical medicine, including physical therapy, occupational therapy and rehabilitation Each exhibit is presented under the auspices of a special exhibit committee. (These exhibits are not open to awards)

### Special Exhibit on Fractures

The special exhibit on fractures is presented for the fifteenth time under the auspices of the following committee

Kellogg Speed, Chicago, chairman
Frank D Dickson, Kansas City, Mo
Walter Estell Lee, Philadelphia

Drs F C Bost and Carleton Mathewson are the San Francisco representatives for the exhibit.

The exhibit will be accompanied by continuous demonstrations throughout the week on the following subjects

Fractures of the Radius—Lower End.
Fractures of the Ankle
Compression Fracture of the Spine.
Fractures of the Carpal Navicular
Fractures of the Shaft of the Femur
Fractures into the Knee Joint

A pamphlet giving some of the essential features of the exhibit will be distributed

The following demonstrators will assist the committee in the presentation of the exhibit

Rodney F Atsatt Santa Barbara Calif
Donald T Babcock Los Angeles
C Glenn Barber, Cleveland
David M Bosworth New York
W J Carson Milwaukee
Arthur H Conley Chicago
Lloyd W Fisher Oakland Calif
Alfred E Gallant Los Angeles
George J Garceau Indianapolis, Ohio
Cerold G Gill Oakland Calif
John L Lindquist Chicago
Robert F Legge Great Lakes Ill
F M Lyle, Spokane Wash
Paul E McMaster, Los Angeles.
Gilbert J McKelvey Portland
James W Martin Omaha
H P Muller Berkeley Calif
Frank G Murphy Chicago
Lawrence Noall Portland Ore
Sheppard Remington Chicago
S L Robbins Cleveland
M John Rowe Jr Long Beach Calif
Fred Shapiro Chicago
M B Shaw Boise Ida
L. D Smith Milwaukee.
C Splithoff Oakland Calif
G Mosser Taylor Los Angeles
J R Tillotson Lima Ohio
Herbert W Virgin Jr, Miami Fla

### Special Exhibit on Physical Medicine

The special exhibit on physical medicine includes physical therapy, occupational therapy and rehabilitation It is presented for the first time under the auspices of the following committee

Frank H Krusen Rochester Minn chairman
Winfred Overholser, Washington D C
Howard A Rusk, New York

The following committees have been appointed to assist the general committee

*Advisory Committee*

Raymond B Allen Chicago
John S Coulter Chicago
Robert W Johnson Jr Baltimore
William D Stroud Philadelphia
Francis B Trudeau Saranac Lake N Y

*Local Committee*

Captain Herman L Rudolph M C U S Army San Francisco chairman
Frances Baker University of California Hospital San Francisco
William H Northway Stanford University Hospital San Francisco

The subjects covered in the exhibit, with the demonstrators in charge, are as follows

Recent Developments in Physical Medicine. Frank H Krusen, Barach Committee on Physical Medicine

This exhibit will outline recent developments in teaching and research as related to physical medicine. New training centers will be described

The Community Rehabilitation Center Howard A Rusk, Barach Committee on Physical Medicine.

This exhibit will present flow charts, organizational charts, floor plans and other data on an ideal community rehabilitation center

Education in Physical Medicine. Frances Hellebrandt, Medical College of Virginia, Richmond.

This exhibit will include data concerning agencies employing physical medicine, undergraduate and graduate education in physical medicine, education of technicians and objective criteria for evaluating departments of physical medicine

Technology and Medicine. Kurt Lion, Massachusetts Institute of Technology, Boston

This exhibit will deal with methods of teaching the fundamentals of technology and biophysics to physicians

Physical Medicine in Military Hospitals Capt Herman L Rudolph, M C, U S Army, San Francisco

This exhibit will present a pictorial review of physical medicine in military hospitals, and certain forms of physical therapy and occupational therapy will be demonstrated.

Reconditioning in Chest Diseases Lieut Col O Leonard Huddleston M C, U S Army, Washington, D C

This exhibit will present methods of physical reconditioning in diseases of the chest.

Heavy Resistance Exercise Therapy Capt. Thomas L. DeLorme Jr, M C U S Army Chicago

This exhibit will present a method of providing heavy resistance exercises in the management of certain orthopedic diseases

Physical Rehabilitation of Amputees Comdr Harry Etter, Bureau of Medicine and Surgery, U S Navy, Washington, D C

This exhibit will demonstrate methods of employing physical therapy and occupational therapy in the rehabilitation of amputees

Restoring Injured Workers Frances Baker and William H Northway, University of California Hospital and Stanford University Hospitals, San Francisco

This exhibit will demonstrate physical and occupational therapy as employed in restoring injured workers

Physical Rehabilitation of Paraplegics George Deaver, Major A B C Knudson and P R. Hawley, U S Veterans Administration, Washington, D C

This exhibit will demonstrate physical therapeutic methods employed in rehabilitation of patients with injuries of the spinal cord.

Vocational Placement of the Handicapped Worker Carl M Peterson, Council on Industrial Health, American Medical Association assisted by Clark D Bridges, Industrial Welfare Department, Zurich Insurance Company, Chicago

This exhibit will demonstrate exact technics for the satisfactory placement of handicapped persons in industry

The following demonstrators will assist in the presentation of the exhibit

Robert L Bennett Warm Springs Ga
Hollis H Buckelew Rogers, Ark.
Howard A Carter Chicago.
Harold Dinken New York
John S Hibben, Pasadena Calif
N Jerome Lee Nashville, Tenn
Lester H Lonergan Loma Linda, Calif
Comdr E L Lowman (MC) U S N Philadelphia.
W D Paul Iowa City
Capt G A Peters M C A U S White Sulphur Springs W Va
George D Wilson Chicago
Walter J Zeiter Cleveland

### Motion Pictures on Physical Medicine

The following motion pictures will be shown in a separate area adjoining the Special Exhibit on Physical Medicine

#### Technology and Medicine

*The Electron* (U S Office of Education) Sound Running time, 16 minutes

*The Diode* (U S Office of Education) Sound Running time, 17 minutes

*The Triode* Amplification. (U. S Office of Education) Sound Running time, 14 minutes

*Principles of Gas Filled Tubes* (U S Office of Education) Sound. Running time, 15 minutes

#### Clinical Applications of Physical Medicine

*Therapeutic Uses of Heat and Cold Part I Administering Hot Applications* (U S Office of Education) Sound Running time, 21 minutes

*Therapeutic Uses of Heat and Cold Part II, Administering Cold Applications* (U S Office of Education) Sound Running time, 22 minutes

*Hydrotherapy* (U S Office of Education) Sound Running time 22 minutes

*Recreational and Occupational Therapy* (U S Office of Education) Sound Running time 13 minutes

*Teaching Crutch Walking* (U S Office of Education) Sound. Running time, 13 minutes

#### Physical Rehabilitation of the Amputee

*Swinging into Step* (Army Service Forces) Sound Running time 44 minutes

*Life Begins Again* (British Information Services) Sound Running time, 21 minutes

*The Diary of a Sergeant* (Army Service Forces) Sound Running time, 20 minutes

#### Physical Rehabilitation of the Paraplegic

*Orthopedic Care of Spinal Cord Injuries* (Institute for the Crippled and Disabled) Sound Running time, 30 minutes

### Physical Rehabilitation in Chest Diseases

*Reconditioning in Chest Surgery* (Army Service Forces) Sound Running time 20 minutes

### Rehabilitation of Convalescent Patients

*Back to Normal* (British Information Services) Sound Running time, 16 minutes

*Reconditioning of the Convalescent* (Army Service Forces) Sound. Running time, 30 minutes

*Out of Bed—Into Action* (Army Service Forces) Sound Running time, 17 minutes

*Voyage to Recovery* (Bureau of Medicine and Surgery) Sound Running time, 30 minutes

*Back to Battle* (National Film Board of Canada) Sound Running time, 23 minutes

*Road to Recovery* (Army Air Forces) Sound. Running time, 40 minutes

### Physical Rehabilitation of the Crippled Child

*Hospital School* (British Information Services) Sound Running time, 11 minutes

### Physical Rehabilitation in Orthopedic Disabilities

*Accident Service* (British Information Services) Sound. Running time 40 minutes

## UNITED STATES ARMY

A group of exhibits is presented depicting the achievements of the Army Medical Department during World War II under the direction of the Surgeon General of the United States Army, Major Gen Norman T Kirk

*Evacuation of Casualties* A flow chart that shows graphically the Army's system of evacuating casualties

*The Preventive Medicine Service,* under the direction of Brig Gen James S Simmons, U S Army, presents the role that preventive medicine played in Medical Department activities in World War II, with special reference to the fields of tropical disease control, sanitation, army laboratories, epidemiology, nutrition, occupational health, civil public health, medical intelligence, typhus control and health education

*The Training Division,* under the direction of Col Floyd L Wergeland, M C, presents (1) a flow chart of the processing, training and assignment of enlisted men, (2) photographs of the step-by-step training given a civilian ordered to active duty, that he may become an adequately trained officer of the Medical Department, (3) the orientation measures for the medical soldier that keep him informed of current events in war and peace, and (4) the various Medical Department publications and visual aids prepared to facilitate the training of all officers and enlisted men

*The Army Nurse Corps,* under the direction of Colonel Florence A Blanchfield, A N C, presents by the use of diorama the story of how nurse power was conserved in army hospitals to compensate for the extreme nurse shortage that existed during World War II, and the effective and efficient use of enlisted technicians, both male and female, Red Cross Nurses' Aides and other nonprofessional people who work under the direct supervision of registered graduate nurses In addition, the conservation of nurse power is also shown by two lighted charts and a series of still pictures projected by a Selectoslide

*The Army Institute of Pathology* under the direction of Col James E. Ash, M C., presents (1) the history of the Institute in a graphic presentation of its past, present and future activities, (2) samples of material studies by the Department of Pathology, with a demonstration of important findings in the realms of general and special pathology, (3) specimens and material available for study by those who apply through the American Registry of Pathology, (4) color reproduction methods with a discussion of the benefits to be gained from each, a collection of illustrative material gathered in all theaters during World War II

*The Neuropsychiatry Consultants Division,* under the direction of Brig Gen William C Menninger, U S Army, presents Neuropsychiatry in World War II This exhibit shows (1) the incidence and magnitude of the neuropsychiatric problems, (2) the organization of the neuropsychiatric services in the Army, (3) the important aspects of preventive psychiatry, including causes of neuropsychiatric disorders, control of stress factors by education, motivation and manipulation of environment, (4) the advances in neuropsychiatric treatment through the use of the psychiatric team, forward area treatment, group psychotherapy, narcosynthesis, shock treatment and special neurologic therapeutic programs, and (5) the neuropsychiatric problems anticipated in the civilian practice of general medicine as a result of the war

*The Surgical Consultants Division,* under the direction of Col Frank L Cole, M C, presents the following group of displays

1 The program for the blind, showing how, through the social readjustment program, the loss of capacities inflicted by blindness are reestablished on a different basis by special technic and training, through proper orientation, instruction in braille and typing, recreation and sports vocational guidance, instruction in industrial skills and business, introduction to the professions and further education, and hobbies

2 The program for the deaf, showing the examination and treatment of the hard of hearing patient and the complete tests to determine hearing acuity, the process of evaluation and selection of hearing aids, auditory training in the use of hearing aids, lip reading instruction in individual and group classes, speech correction and conservation, and ancillary programs to complete the patient's adjustment to his handicap

3 Plastic surgery This illustrates the methods used in the reconstructive surgery of shell fragment wounds of the face, jaw and extremities and including studies of free skin grafts, local and remote flaps and bone, cartilage and fascial transplants There is also presented a recently described supraclavicular skin graft from the base of the neck and the composite graft of the skin and cartilage from the ear

4 Hand surgery This shows the importance of combined plastic and orthopedic surgery in preparing for surgery on tendons, nerves, joints and bones of the hand All stages of orthopedic surgery on these parts are presented

5 Thoracic surgery This shows the pertinent pathologic changes, diagnostic factors, indications for surgery and the technical procedures associated with pulmonary resections for tuberculosis, mediastinal tumors and surgery of the esophagus

6 Principles of the surgical management of the wounded. Here are shown the essential principles of surgical management of the wounded in the overseas theaters Particular emphasis is placed on the two most important phases, i e initial and reparative surgery

Initial surgery is concerned with accomplishing a state of complete resuscitation that permits surgery to be performed and with those surgical procedures which are designed to prevent or eradicate wound infection

Reparative surgery is designed to prevent or cut short wound infection either before it is established or at the time of its inception It is concerned with shortening the period of wound healing, and it seeks as its objective the early restoration of function and the return of the soldier to duty in a minimum number of days

7 Vascular surgery This illustrates the manifestations, diagnosis, pathology, physiology and treatment of vascular injuries, aneurysms and cold injuries (frostbite and trenchfoot)

8 Neurosurgery Essential factors associated with cranioplasty, peripheral nerve pathology, post-traumatic epilepsy and paraplegia are shown, and the accepted management of these conditions is described There is also a demonstration of tantalum plates and the methods used in their preparation.

9 Amputations and prostheses Various types of emergency and definitive amputations are demonstrated by drawings and photographs Developments in prosthetics concerning the cosmetic hand and the metal and plastic limb are presented.

10 Orthopedic advances This display includes kodachromes, translite x-ray reproductions and moulages to show the repair of skin and bone defects Utilization of acrylic implants is demonstrated.

*The Dental Division,* under the direction of Brig Gen Thomas L Smith, Medical Department (D C), presents (1) an exhibit of the materials, their fabrication and the procedures employed in the preparation, fitting and insertion of tantalum plates as used in the repair of cranial injuries, (2) models of the steps employed in the fabrication of artificial acrylic eyes and a pictorial series of completed cases, (3) the various steps used in the manufacture of the individual ear pieces required for the conduction of sound from hearing aid receiver to the patient's ear drum, (4) different types of splints used during World War II to reduce and retain in their proper position fractures of the mandible and maxilla, as well as the appliances used in the treatment of fractures of facial bones, and (5) the methods used in the production of artificial ears, noses and other lost tissues of the face and head

*The Medical Consultants Division* under the direction of Col Arden Freer, M C, presents

1 Malaria data on relapses and a study of the methods of treatment and the results obtained with various drugs

2 Leishmaniasis (kala-azar) diagnosis and treatment

3 Schistosomiasis early symptoms, clinical course and results of treatment.

4 Infectious hepatitis diagnosis course and treatment.

5 Skin diseases the importance of atypical lichen planus and diphtheria

6 Radiopaque angiocardiography

7 Pulmonary tuberculosis as seen in the United States Army

8 Medical statistics showing a comparison of main causes of physical rejection of selectees at induction stations and separation for physical disability of enlisted men from the military service, and a comparison of World War II disease mortality rates with those of previous wars, i e. Mexican, Civil, Spanish-American, Philippine Insurrection and World War I

*The Army Air Forces School of Aviation Medicine* Randolph Field, Texas under the direction of Brig Gen Eugene G Reinartz, U S Army, presents

1 Physiologic studies of respiration, asphyxia and resuscitation Wall charts describe a quantitative theory for chemical control of respiration and the rationale for carbon dioxide mixtures in resuscitation.

2 The effects of deceleration in animals Such effects are displayed by wall charts, kodachrome transparencies, photos and moving pictures in color and with sound

*The Air Evacuation Headquarters Air Transport Command,* Bolling Field Washington, D C, under the direction of Col M S White, M C, presents A T C long distance air evacuation of equipment, photographs, a panorama moving picture of ditching, forced landing in water and the air evacuation of wounded Special charts show evacuation of patients by campaign and cause, the chain of evacuation, the criteria for air evacuation immunizations required for personnel traveling by air, the priority by type of injury for evacuation of patients, classification of evacuation of patients by components air evacuation versus water evacuation by percentages aerial ports and the activities and duties associated with all the medical aspects of air evacuation

*The Aero Medical Research Laboratory,* Wright Field, Dayton, Ohio under the direction of Col Loyd E Griffis, M C presents equipment used in flight. This includes equipment used in flight, photographs transparencies, clothing, color vision tests and kodachrome photographs

*The Medical Department of the Army Ground Forces,* under the direction of Col F A Blesse M C. the Ground Surgeon, presents newly developed Medical Department field equipment. Equipment is shown which has been developed or is under development for use by field medical units of Army Ground Forces

*The Veterinary Service,* under the direction of Col James A McCallam V C, presents

1 Food inspection service of the United States Army Pictures of food inspection in the field and laboratory, pictures and slides of animal diseases transmissible through food to man, demonstrations of some of the common methods of chemical and bacteriologic analysis of food, charts and diagrams depicting the volume of food inspected at home and abroad, types of food inspection and causes of rejection are shown

2 Research activities of the Veterinary Corps Record of findings pertinent to equine influenza, periodic ophthalmia, canine leptospirosis and breeding diseases of horses are displayed

3 Animal service A showing of activities in connection with the care and treatment of animals, the research and development of protective agents and equipment against chemical warfare agents, and the production of some of the commonly used vaccines

4 This presentation will also include a display of equipment such as the improved horse and dog gas masks pictures, slides and demonstrations

*The Personnel Service* under the direction of Col Francis P Kintz, M C., presents officers and enlisted men of the Medical Department, United States Army This exhibit includes (1) a series of charts showing graphically the utilization, procurement, composition and rate of separation of Medical Department officers and (2) charts and illustrations of the contributions made by enlisted men of the Medical Department

*The Hospital and Domestic Operations Division,* under the direction of Lieut Col James T McGibony, M C., presents (1) the zone of interior World War II hospitalization scheme including animated maps depicting the location of army hospitals by type (i e station regional and general or convalescent), showing the regulating of movements of patients from various sources to the appropriate type of hospitals and identifying a few specialized treatment centers, (2) a model of a mobilization type general hospital (Kennedy General Hospital, Memphis, Tenn), (3) a model of a hospital car, showing the interior of the car, (4) a brochure depicting the establishment and operation of a convalescent hospital (Welch Convalescent Hospital, Daytona Beach Fla) (5) a chart illustrating the overall patient load in zone of interior hospitals from 1939 to 1946, with the total number of beds available, (6) photographs of various hospitals, illustrating different structural types (7) publications that prescribe hospital administration procedures, (8) a chart illustrating how prisoner of war hospitalization was accomplished in the zone of the interior during the war, and (9) an invitation to each visitor to inspect a hospital ship and a hospital train.

*The Physical Medicine Consultants Division* under the direction of Col Edward M DeYoung, M C, presents physical medicine in World War II This includes (1) pictures and charts to demonstrate physical therapy activities in various types of army hospitals located in the communications zone and the zone of the interior (2) pictures to demonstrate physical reconditioning by use of physical activities scientifically designed and medically prescribed emphasizing general conditioning exercises remedial activities and sports adapted to the needs of all types of military patients, (3) the methods of treatment and technic used in various phases of occupational therapy in the zone of interior hospitals, as illustrated by pictures, projects and a model of an orthopedic occupational therapy shop and (4) pictures and charts to demonstrate educational reconditioning and counseling activities

(Motion Pictures will be shown in the Veterans Building in the Civic Center See Motion Picture Program)

## UNITED STATES NAVY

A group of exhibits is presented under the auspices of the Bureau of Medicine and Surgery United States Navy showing many of the advances in medicine as encountered in the Navy

COMDR H R BIERMAN (MC), U S N R, Naval Medical Research Institute, Bethesda, Md.

*Studies on Linear Acceleration* Exhibit including some of the devices developed in the U S Navy for the investigation of the effects of accelerating forces (impacts) on human volunteers The study of these forces has led to the development of protective devices which measurably reduce the physical

damage incurred in aircraft crashes and in parachuting from planes traveling at speeds over 500 miles per hour or at altitudes above 35,000 feet

G J THOMPSON, Rochester, Minn., and U S Naval Hospital, Bethesda, Md

*The Management of the Urinary Bladder in Cases of Cord Injury* Exhibit presents a graphic presentation of a method by which a patient with cord injury can maintain a satisfactory control of the urinary bladder

COMDR E E BARKSDALE (MC), U S N, U S Naval Hospital, Bethesda, Md

*The Atabrine Dermatoses* Exhibit of colored pictures showing the chief characteristics of the dermatitis occasionally accompanying the long continued use of atabrine

COMDR. E E BARKSDALE (MC), U S N, U S Naval Hospital, Bethesda, Md

*Penicillin in Syphilis* Exhibit presenting the results of the treatment of primary, secondary and tertiary syphilis with penicillin

COMDR ROBERT LANGLEY (MC) U S N, U S Naval Hospital, Long Beach, Calif

*Bundle Branch Block* Exhibit of electrocardiographic tracings and statistics showing the means of diagnosis and the frequency of this condition in naval personnel

COMDR. W L JANUS (MC), U S N, U S Naval Hospital, Long Beach, Calif

*Skin Cancer in Naval Personnel in the Pacific* Exhibit showing, by means of color transparencies and statistics, the types and frequency of skin cancer particularly as it occurred in naval personnel exposed to the tropical sun in the Pacific

COMDR. JULIUS M AMBERSON (MC), U S N R, Naval Epidemiology Unit No 50

*Middle Eastern Schistosomiasis* Exhibit including the weeds, the snails, pictures of the miricidia and cercariae, and pictures of clinical cases of infection with Schistosoma hematobium and with Schistosoma mansoni

CAPTAIN SHIELDS WARREN (MC), U S N, National Naval Research Institute, Bethesda, Md

*The Pathologic Effects of the Atomic Bomb* Exhibit of pictures illustrating the five chief effects of the atomic bomb on its victims

COMDR. JULIUS M AMBERSON (MC), U S N R, Naval Epidemiology Unit No 50

*The Modern Management of Cholera* Exhibit of statistics and pictures demonstrating the spectacular results obtained on moribund patients with cholera by the use of blood plasma and sulfadiazine.

COMDR S A. BRITTEN (MC), U S N R, Preventive Medicine Division, Bureau of Medicine and Surgery and U S Public Health Service, Washington, D C

*The Results of Routine Chest Photofluorographic Examinations—Naval Personnel and Civilian Hospital Admissions* Exhibit of pictures and statistics showing the results obtained in the photofluorographic examination of the chests of approximately 3,000,000 naval personnel and several thousand civilian hospital admissions

(Motion Pictures will be shown in the Veterans Building in the Civic Center See Motion Picture Program)

## SECTION EXHIBITS

Each of the seventeen sections of the Scientific Assembly has arranged a group of exhibits dealing with the various branches of medicine

### Section on Internal Medicine

The representative to the Scientific Exhibit from the Section on Internal Medicine is Thomas C Garrett, Philadelphia.

JOSEPH HARKAVY, Mount Sinai Hospital, New York

*Cardiovascular Allergy* Exhibit demonstrating various manifestations in the heart and blood vessels due to allergy Part I deals with clinical syndromes resulting from hypersensitiveness to tobacco, foods, drugs, serums and inhalants (*a*) Peripheral vascular disease thromboangiitis obliterans, migrating phlebitis, intermittent claudication. (*b*) Heart arrhythmias, i e. premature contraction, paroxysmal tachycardia and auricular fibrillation, angina pectoris and coronary artery disease Part 2 deals with bacterial allergy evidenced by hyperergic vascular disease such as acute arteritis, necrotizing arteritis, endarteritis obliterans and periarteritis nodosa, giving rise to bronchial asthma, transitory pulmonary infiltrations with eosinophilia, cardiac and renal involvement, polyserositis, urticaria, purpura and angioneurotic edema.

IRVING TREIGER, University of Illinois School of Medicine and Presbyterian Hospital, Chicago

*Correlative Study of Cardiac Diseases* Exhibit of translite films for correlative study of roentgenograms, electrocardiograms and pathologic specimens of most common cardiac diseases to emphasize the clinical and diagnostic values of various methods of examination

BERTHOLD R COMEAU, A M LYLE and HENRY B KIRKLAND, Prudential Insurance Company, Newark, N J

*Diagnostic Advantages of Multiple Precordial Leads* Exhibit showing contribution of multiple precordial leads to electrocardiographic diagnosis The single chest lead being normal, other precordial leads demonstrate anteroseptal infarct, lateral infarct, T wave abnormalities, ST elevation and right bundle conduction defect Examples of anterior wall infarct complicating right bundle branch block and of right ventricular hypertrophy are shown Estimation of infarct size is demonstrated. Borderline apex leads are clarified by other precordials Characteristics of normal multiple precordial leads are outlined Some notes on technic are included

WALTER S PRIEST, CHAS J MCGEE, JACQUES M SMITH, Wesley Memorial Hospital and Northwestern University Medical School, Chicago, and EUGENE HILDEBRAND, Great Falls, Mont.

*Antibiotic Therapy of Subacute Bacterial Endocarditis A Clinical and Histologic Résumé* Exhibit showing failures with inadequate penicillin dosage, the unreliability of normal temperature, improved sense of well being and a negative blood culture as criteria for adequacy of therapy color transparencies of gross specimens and of microscopic slides showing various stages of healing and bacteria filled fibrin from patients inadequately treated, correlation of the clinical charts and negative blood cultures with the persistence of the active lesion, color transparencies showing invasion of the valves and subendocardial tissue by bacteria via capillaries as well as direct invasion of injured endothelial cells along the very margin of the valve, color transparencies showing myocardial lesions, charts of serum levels obtained with various doses of penicillin by different methods of administration, illustrating particularly the serum levels found necessary for cure in relation to the in vitro penicillin sensitivity of the organism, serial electrocardiograms made during treatment and correlation of changes, if any, with the myocardial lesions found at autopsy pathologic anatomy and histology of valves in relation to the value of the sedimentation rate and leukocyte count as criteria for adequacy of treatment, pathologic, anatomic and histologic evidence of the apparent unimportance of anticoagulants in the treatment of the disease. Chart of 3 patients treated with streptomycin, with anatomic and histologic specimens, will also be shown

GEORGE E. BURCH TRAVIS WINSOR and J LEROY KIMBALL, Tulane Medical School, New Orleans

*Clinical Applications of Venous Pressure Measurements* Exhibit of diagrams, illustrations, graphs and demonstrations of the methods, including a presentation of the underlying principles of pressures in the veins, venous hypertension and hypotension as related to normal venous blood flow and disturbances with flow in disease states generally and locally Normal venous

pressure values and studies on patients with disease states with values before and after therapy are indicated The diagnostic value of venous pressure studies is emphasized

BERT E STOFER, GORDON B MYERS and TOMIHARU HIRATZKA, Wayne University College of Medicine and City of Detroit Receiving Hospital, Detroit

*Correlation of Electrocardiographic Findings with Cardiac Pathologic Conditions* Exhibit dealing with a study based on a series of 290 cases all of which showed standard and multiple precordial leads (Wilson type) and most of which showed Goldberger extremity leads All hearts were injected with radiopaque material, appropriately sectioned, and roentgenograms made The hearts were subjected to careful gross dissection checked by multiple microscopic blocks to delineate areas of infarction and other abnormalities The exhibit consists of the electrocardiograms and the roentgenograms of injected hearts from cases which illustrate the normal findings and those in left ventricular hypertrophy, right ventricular hypertrophy, pericarditis and anterior, lateral posterior and septal infarction

CARROLL L BIRCH and LOUIS R LIMARZI, University of Illinois College of Medicine, Chicago

*Diseases of the Blood* Exhibit showing thirty kodachrome photomicrographs and enlargements of blood and bone marrow smears normal blood, pernicious anemia, iron deficiency anemia, leukemia and several other blood dyscrasias

PAUL M AGGELER and S P LUCIA, University of California Medical School, San Francisco

*Bleeding Tendency in Hemorrhagic and Systemic Diseases* Exhibit based on an original study of the bleeding tendency in over 500 patients suffering from various diseases, showing (1) the physiology of hemostasis, (2) the clinical pathology of abnormal bleeding and (3) the clinical manifestations of the hemorrhagic states Under the latter heading are considered the hemostatic defect, hemorrhagic manifestations, hemostatic tests and the treatment of hemophilia primary and secondary thrombocytopenic purpura, obstructive jaundice, diseases of the liver hypertension and renal disease, gastrointestinal diseases and other conditions in which abnormal bleeding is present.

K J HENRICHSEN and RICHARD DAVISON, Municipal Tuberculosis Sanitarium, Chicago

*Differential Diagnosis in Tuberculosis and Nontuberculous Conditions Encountered in the Sanitarium* Exhibit consisting of roentgenograms and pathologic specimens demonstrating diseases of the lungs, tuberculosis and nontuberculous conditions and their treatment

D B ARMSTRONG and G M WHEATLEY Metropolitan Life Insurance Company, New York

*Studies in Heart Disease* Exhibit of charts dealing with the increase in the death rate from heart disease and its explanation, the prevalence of heart disease, variations in etiology of heart disease by sex, age and region, socioeconomic and occupational differences in mortality from heart disease, and the longevity of persons with heart disease of various types

SHEPARD SHAPIRO New York University College of Medicine, New York

*Prothrombin Estimation Whole and Diluted (12.5 per cent) Plasma Prothrombin Clotting Time* Exhibit showing (1) demonstration of the technic, (2) charts illustrating advantages of procedure (*a*) increased sensitivity, (*b*) hyperprothrombinemia (*c*) excess anticoagulant effect, (3) clinical applications of the method (*a*) drug-induced hypoprothrombinemia, (*b*) demonstration of reactive hyperprothrombinemia (*c*) liver function test, (*d*) demonstration of vitamin K activity

J Q GRIFFITH JR. and M A LINDAUER, Hospital of the University of Pennsylvania Philadelphia R L SHANNO Forty Fort Pa and J F COUCH, U S Department of Agriculture Eastern Regional Laboratory

*Rutin Treatment for Arterial Hypertension Characterized by Increased Capillary Fragility* Exhibit of charts and photographs including (1) demonstration of the method for measuring capillary fragility in man, based on the method of Gothlin, (2) demonstration of rutin powder, rutin crystals under the microscope and description of the chemical properties of rutin (3) the incidence of increased capillary fragility in hypertension, effect of therapy with thiocyanate and relation to the hemorrhagic complications of apoplexy and retinal hemorrhage, (4) the result of treating such persons with rutin, including effect on blood pressure and symptoms and comparison of results with hesperidin, and (5) a method suitable for bioassay of rutin

ALBERT H ROWE and ALBERT P ROWE JR., P A Surg U S P H S (R), Oakland, Calif

*Bronchial Asthma—Its Diagnosis and Treatment* Exhibit presenting (1) the importance of a proper history, (2) the value of skin testing in inhalant allergy, (3) the fallibility of the skin test, especially in food allergy, (4) the value and use of the exhibitors' elimination tests for the study and control of food allergy, (5) the relative frequency of food, inhalant and infectant allergies as causes of bronchial asthma, (6) the infrequency of intrinsic and psychogenic asthma, (7) the seasonal and geographic influences on asthma due to food allergy, (8) the complications of bronchial asthma, (9) the control of mild or moderate symptoms, (10) the treatment of intractable asthma.

WILLIAM B KOUNTZ, LILLI HOFSTATTER and PHILIP ACKERMANN, St Louis Chronic Disease Hospital and Infirmary, St. Louis

*Degenerative Changes in Man Associated with Age* Exhibit of charts and data accumulated over period of eight years study of elderly people in the St. Louis Chronic Disease Hospital and Infirmary The studies were chiefly on such factors as the influence of age and degeneration on the known physiologic functions of the body Such studies as glucose tolerance exercise tolerance, vital capacity and renal function were made and records compiled Comparative health evaluation and age studies in different age groups are considered. Partial reestablishment of metabolic factors in older people will be demonstrated.

HOWARD F ROOT, ELLIOTT P JOSLIN PRISCILLA WHITE and C CABELL BAILEY, George F Baker Clinic and New England Deaconess Hospital, Boston

*Diabetes in the Clinic and Laboratory* Exhibit of charts with new statistics on the incidence and results of treatment, including a survey of children with twenty or more years duration, new data on alloxan diabetes, treatment of pregnancy in diabetes and coma, with differential diagnosis

### Section on Surgery, General and Abdominal

The representative to the Scientific Exhibit from the Section on Surgery, General and Abdominal, is Warren H Cole, Chicago

LEO LOEWE, EDWARD HIRSCH, DAVID M GRAYZEL, BERNARD S EPSTEIN and HAROLD B EIBER, Jewish Hospital of Brooklyn, Brooklyn

*Heparin in the Treatment of Thromboembolic Disease* Exhibit demonstrates the functional pathology of thombosis and the problems of thromboembolic disease. Experimental evidence is graphically presented elucidating the rationale of subcutaneous heparin in the Pitkin menstruum for the conservative management of thomboembolism The material exhibited portrays technics of administration, observations of its clinical deportment and results of treatment in various thrombotic conditions such as venous thromboembolism subacute bacterial endocarditis, peripheral vascular disease arterial embolization, retinal vein occlusion and experimental human frostbite.

WILLIAM T GREEN and DAVID S GRICE, Department of Orthopedic Surgery, the Children's Hospital, Boston

*Skeletal Manifestations in Neurofibromatosis* Exhibit presenting cases of neurofibromatosis with skeletal involvement correlation of clinical appearance, roentgenographic lesions and pathologic sections

ROBERT E. GROSS, Department of Surgery, the Children's Hospital, Boston

*Coarctation of the Aorta* Exhibit presenting technic of operation and postoperative results in coarctation of the aorta

ORVAR SWENSON, Department of Surgery, the Children's Hospital, Boston

*A Nonsuture Method of Vascular Anastomosis, Using an Absorbable Tube* Exhibit presenting experimental work on a nonsuture method of vascular anastomosis, using an absorbable tube

FRANC D. INGRAHAM and DONALD D. MATSON, Neurosurgical Service, the Children's Hospital, Boston

*Subdural Hematoma in Infancy* Subdural hematomas in infants under 2 years of age are much more common than generally recognized and require a careful program of both conservative and surgical treatment. The experience of 150 cases is used to demonstrate (1) the important symptoms and signs witnessed, (2) the indications and exact technics for diagnostic and therapeutic subdural punctures, (3) the plan of operative treatment used, (4) the pathologic types seen and (5) the follow-up results which have been obtained.

GORDON B. NEW and JOHN B. ERICH, Mayo Clinic, Rochester, Minn.

*Partial and Total Loss of the Nose. Plastic Reconstruction by Pedicle Skin Grafts* Exhibit showing the technic employed for the plastic repair of partial and total loss of the nose by means of pedicle skin grafts, illustrated by means of moulages and photographs to show the end results.

HILGER PERRY JENKINS, RUDOLPH JANDA, JAMES CLARKE, EDWARD H. SENZ and HOWARD W. OWEN, University of Chicago Department of Surgery, Chicago

*Gelatin Sponge—Absorbability and Hemostatic Action* Exhibit showing studies on the absorbability and hemostatic action of gelatin sponge, demonstrated by a series of photographs and photomicrographs. Gelatin sponge undergoes absorption within a period of about five weeks, but the rate of absorption may be considerably accelerated by leukocytes. Bleeding from wounds of the liver, kidneys and spleen can be controlled by gelatin sponge in experimental animals without the use of sutures or the addition of thrombin. In addition, good hemostasis has been obtained in experimental liver resections and in injuries to large veins. Data are also presented on the use of gelatin sponge in clinical surgery, with studies of specimens removed at subsequent operation or autopsy.

VIRGINIA KNEELAND FRANTZ, Columbia University College of Physicians and Surgeons, New York.

*Oxidized Cellulose in Surgery* Exhibit showing comparative studies in animals of various absorbable hemostatic agents, with particular emphasis on oxidized cellulose, experimental studies of the use of this material in reconstructive surgery, particularly joint surgery, charts and illustrations of the use of the material in clinical surgery. The gross animal specimens and the clinical illustrations are shown in kodachrome transparencies.

EDGAR J. POTH, University of Texas Medical Branch, Galveston, F. L. KNOTTS, Washington University Medical School, St. Louis, and C. A. ROSS, University of Illinois School of Medicine, Chicago

*Succinylsulfathiazole and Phthalylsulfathiazole* Exhibit presenting experimental data and evidence demonstrating the bacteriostatic action of succinylsulfathiazole and phthalylsulfathiazole in the gastrointestinal tract. The application of the drugs in the treatment of the dysenteries, ulcerative colitis, regional enteritis, chronic coliform infections of the urinary tract, and in the preoperative preparation and postoperative care of patients subjected to operations on the bowel is demonstrated. Specimens of segments of bowel which have had various forms of ligations of the blood supply performed, showing the control specimens in which almost complete dissolution of the wall of the viscus occurred and the specimens taken at various intervals showing the protection afforded following the administration of succinylsulfathiazole and phthalylsulfathiazole. Plates showing the characteristic growth of coliform organisms on desoxycholate plates and a simplified streak technic will be demonstrated.

HARRY E. BACON and LOWRAIN E. MCCREA, Temple University Hospital, Philadelphia

*Surgical Treatment of Rectal Cancer and Management of Associated Vesical Dysfunction* Exhibit showing series of models disclosing various premalignant and malignant lesions. Preoperative and postoperative management is presented and technic of surgical removal eliminating the abdominal colostomy and means of preserving the sphincter musculature shown. In spite of the high rate of resectability (88 per cent) and operability (91.1 per cent) the mortality is low (6.2 per cent), the period of hospitalization is short (13.7 days), return to work is early, the sphincter function is excellent, the survival rate as to three year cure is 58.6 per cent and five year cure is 50 per cent. Transparencies show normal distribution of nerve supply to bladder and the surgical disturbance of the hypogastric plexus during proctosigmoidectomy. Drawings depict cystometric readings prior to and immediately following the surgical procedure and following return to normal. Models show various bladder lesions in association with rectal cancer as viewed through the cystoscope.

RICHARD B. CATTELL, the Lahey Clinic, Department of Surgery, Boston

*Surgery of the Pancreas* Exhibit showing the clinical analysis of 100 patients with obstructive jaundice due to malignancy, operative methods, including pancreatoduodenal resection, colored photographs of specimens and results of treatment.

TIBOR DE CHOLNOKY, New York Postgraduate Hospital and Medical School, Columbia University, New York

*Cancer of the Head, Neck and Breast* Exhibit presenting photographs and transparencies of patients with tumor of the head, neck and breast selected to illustrate the surgical treatment of early, neglected and recurrent lesions. Emphasis is laid on radical excision regardless of defects and early reconstruction. Head and neck cancer responds favorably to radical surgery, however, in late and advanced cases the possibility of palliation and arrest still exists, which is demonstrated. The primary purpose is therefore the eradication of the disease, because surgical repair is not usually a limiting factor. Radical operation of early cancer of the breast and surgical handling of the recurrent and neglected advanced cancer of the breast are included.

## Section on Obstetrics and Gynecology

The representative to the Scientific Exhibit from the Section on Obstetrics and Gynecology is Frederick H. Falls, Chicago.

FREDERICK H. FALLS, University of Illinois College of Medicine, and CHARLOTTE S. HOLT, Illinois State Department of Public Health, Chicago

*Toxemias of Pregnancy* Exhibit presenting the main features of the pathology of eclamptogenic toxemia, nephritic toxemia, hyperemesis gravidarum and acute yellow atrophy. The correlation between the pathology and the symptomatology is pointed out. Different types of eclamptogenic toxemia are depicted, and the treatment is outlined. The differences in management of eclamptogenic and nephritic toxemias are indicated. The three groups of hyperemesis gravidarum are described and their treatment is outlined. The material consists of drawings and gross and microscopic materials, sculptured models, graphs and statistical charts, illustrating the etiology and pathology and giving the symptoms, diagnosis and treatment of these different types of toxemias.

CHARLES E. GALLOWAY, Northwestern University Medical School, Chicago, and Evanston Hospital, Evanston, Ill.

*Early Diagnosis of Cervical Carcinoma* Exhibit demonstrating (1) various methods of cervical examination, (2) detailed methods of cervical biopsy, both office and hospital, (3) kodachrome illustrations of cervical biopsies, carcinomas, leukoplakias, erosions, tuberculosis and other cervical lesions resembling carcinoma in which biopsy is necessary. The

general practitioner needs to be helped as to which cervix needs a biopsy and which does not and where the biopsy should be obtained and how it should be obtained He also needs to be shown that hospitalization is not necessary, demonstration of office technic is given

SHELDON A PAYNE, EDWARD T TYLER, Shelton Clinic, Los Angeles, and ALBERT TYLER, California Institute of Technology, Pasadena

*Electron Microscopic Studies of Normal and Abnormal Sperm* Exhibit showing the results of study of material obtained from patients under investigation for infertility and the response to treatment with some of the newer gonadotropic substances

JOE V MEIGS, HOWARD ULFELDER, HELEN M GILBERT RUTH M GRAHAM, MAURICE FREMONT-SMITH and SOMERS H STURGIS, Massachusetts General Hospital, Boston

*The Vaginal Smear in Diagnosis of Cancer of the Uterus Its Practical Application* Exhibit includes method of taking, staining and examining the vaginal smears, and photomicrographs of normal and malignant cells Abstracts of 25 cases of uterine cancer either unsuspected or primarily diagnosed by vaginal smear and the diagnostic cells found in these cases are demonstrated

ROBERT A WOODBURY, RICHARD TORPIN RAYMOND P AHLQUIST GEORGE P CHILD, WALTER G WATSON and LOUISE JARBOE, University of Georgia School of Medicine Augusta, Ga

*Electrouterograms and Pressures in the Human Uterus and Cervix as Related to Dysmenorrhea Hypermenorrhea and Pregnancy* Exhibit showing results when uterine and cervical pressures and electrouterograms were recorded from patients at various times of the menstrual cycle and of pregnancy In dysmenorrhea and in dystocia dystrophy records show that multiple origin of impulses frequently occurs and contractions are superimposed on one another They may remain as organized contractions and develop pressures as high as 300 mm. of mercury or become disorganized and develop various forms of uterine tetany In labor the highest recorded pressure developed by the uterus is 100 mm. of mercury Typical dysmenorrhea symptoms were produced in human beings and various forms of treatment were evaluated.

W L WILLIAMSON and L W KIBLER Postgraduate Committee in Gynecology, Tennessee State Medical Association Memphis

*Postgraduate Study in Gynecology* Exhibit of a map of the state of Tennessee showing instruction centers by circuit districts The centers are shown by stars Charts show the personnel of the State Medical Association Postgraduate Committee and the number of physicians participating in all courses for a period of nine years Outlines of all past courses, from the beginning, are available on the shelf Manuals containing the lectures of all courses offered to date are on display

I C. RUBIN and BERNARD BERGLAS Mount Sinai Hospital, New York

*Roentgen Ray Myography in the Female Pelvis* Exhibit showing clinical roentgen ray visualization of the levator ani muscle in relation to vagina and uterus under normal conditions and in uterine prolapse (*a*) transparencies showing levator ani injected with contrast medium in relation to uterus and vagina in living subjects (*b*) diagrams and drawings of cadaver specimens showing difference in dynamic functional relations

## Section on Ophthalmology

The section exhibit committee of the Section on Ophthalmology consists of Georgiana D Theobald Oak Park, Ill, chairman Derrick Vail, Cincinnati, and A B Reese, New York.

HAROLD F FALLS, University Hospital, Ann Arbor, Mich

*Hereditary Ocular Anomalies* Exhibit consisting of three sections each presenting a type of hereditary ocular anomalies, including the pedigree of the family with the condition accompanied by several illustrations of the actual funduscopic and iris pictures The three conditions to be shown are (1) retinitis pigmentosa, (2) anterior segment developmental anomalies and (3) choroideremia

A D RUEDEMANN, Cleveland Clinic Foundation, Cleveland

*A Permanent Plastic Eye* Exhibit showing the technic of operation, orbital studies and end results

DONALD J LYLE, Cincinnati

*Neuro Ophthalmology* Exhibit consisting of (1) visual field charts demonstrating various locations and lesions in the visual pathways and centers, with illustrative case reports, (2) semidiagrammatic drawings showing syndromes associated with eye movements, with illustrative case reports, and (3) drawings of anatomic sections and preparations

K. W ASCHER, University of Cincinnati College of Medicine, Cincinnati

*Aqueous Veins* Exhibit showing that aqueous veins are blood-vessel-like structures containing a clear colorless fluid or diluted blood and intercalated, via Schlemm's canal, between intraocular fluid on one side and conjunctival and subconjunctival veins on the other side The qualities of the aqueous veins, their physiologic and clinical significance and the influence of experimental physiologic and pharmacologic factors are shown Backflow phenomena into the canal of Schlemm and responsiveness to miotics and to surgery are described. In the aqueous veins, intraocular fluid, clear or mixed with blood, is accessible to biomicroscopic observation

LORAND V JOHNSON, University Hospital, Cleveland

*Ocular Toxoplasmosis* Exhibit showing drawings of fundus appearance of human toxoplasmosis and charts concerning incidence and details of Sabine test for neutralizing antibodies

## Section on Laryngology, Otology and Rhinology

The representative to the Scientific Exhibit from the Section on Laryngology, Otology and Rhinology is Paul H. Holinger, Chicago

J M ROBISON University of Texas School of Medicine, Houston

*Pressure Treatment of Maxillary Sinusitis* Exhibit of roentgenograms and charts showing the theory and practice of the application of local pressure to the mucosa of the maxillary sinus

PAUL H HOLINGER, TOBI JONES and ALBERT H ANDREWS JR, University of Illinois College of Medicine, Chicago

*Endoscopic Photography in Otolaryngology and Bronchoesophagology* Exhibit consisting of kodachrome photographs of the ear, nose and throat tracheobronchial tree and esophagus The normal endoscopic fields are shown as well as examples of the common pathologic conditions seen through the otoscope, laryngoscope, bronchoscope and esophagoscope The camera devised for this photography will be illustrated

ROMEO A LUONGO, Philadelphia

*Rhinoplasty* Exhibit showing all the steps of the technic for rhinoplasty, given in detail by means of drawings casts, masks and anatomic specimens A series of casts with instruments in place illustrate the most important steps, and the drawings show the minutest details Physiologic aspects of rhinoplasty will be demonstrated also

GEORGE E SHAMBAUGH JR., Northwestern University Medical School Chicago

*Factors That Influence the Results of the Fenestration Operation for Otosclerosis* Exhibit showing how clinical experience in 1,000 consecutive fenestration operations indicates that bony closure and postoperative labyrinthitis are the chief causes for failure to obtain a permanent hearing improvement Experimental fenestration operations on the monkey have demonstrated certain of the factors that influence bony closure and labyrinthitis A new improved fenestration technic to take advantage of these

factors has reduced bony closures to less than 5 per cent of operations done on the human ear and has reduced the incidence of labyrinthitis Photomicrographs are shown to demonstrate these factors, specimens and apparatus used in the improved fenestration operation are demonstrated also

### Section on Pediatrics

The representative to the Scientific Exhibit from the Section on Pediatrics is W Ambrose McGee, Richmond, Va

THEODORE O ELTERICH, University of Pittsburgh and Allegheny General Hospital, Pittsburgh

*Origin of Certain Pediatric Names and Phrases—Original Conception—Present Day Interpretation* Exhibit explaining and illustrating the origin of certain phrases commonly used in pediatrics, such as St Vitus's dance murmur deRoger, rachitic rosary, Harrison's groove Chvostek's sign, Trousseau's sign, hutchinsonian triad and identifying certain personalities who have had diseases named after them such as Froehlich Still, Little, Gaucher and Banti It is the author's thesis that as the years have passed the original conception of a given disease has been lost and a somewhat modified and often erroneous, present day interpretation has gradually evolved An attempt to correct this misinterpretation is made—to link the historical past with present day scientific advances

KATHERINE BAIN Children's Bureau U S Department of Labor, Washington

*Pediatric Unit for Hospitals* Exhibit showing a model designed by the Children's Bureau, U S Department of Labor, and U S Public Health Service, Federal Security Agency

JOHN P HUBBARD, American Academy of Pediatrics, Washington, D C

*Study of Child Health Services* Exhibit showing the organization and objectives of the study being made on child health services in the United States

MILTON B COHEN, the Asthma and Hay Fever Clinic and the Cleveland Health Museum, Cleveland

*Immunology of Allergy as Illustrated by Hay Fever* Exhibit showing the immunology of allergy, how allergy develops, specific treatment with pollen extract and immunization against H substance

### Section on Experimental Medicine and Therapeutics

The representative to the Scientific Exhibit from the Section on Experimental Medicine and Therapeutics is Robert W Wilkins, Boston

AUSTIN SMITH and WALTON VAN WINKLE JR, Council on Pharmacy and Chemistry, American Medical Association, Chicago

*Endocrine Products Actions and Uses* Exhibit showing the actions and uses of endocrine products known to be of worth while therapeutic value in the control of endocrine disorders and other diseases Information to help clarify the present confusing nomenclature situation and the confusion that exists concerning units and weight measures is included

DAVID SCHWIMMER, THOMAS H MCGAVACK and I J DREKTER, New York Medical College, Metropolitan Hospital Research Unit Welfare Island, New York

*Metabolic Studies in Human Volunteers on Limited Food and Water Intake* Exhibit of charts, graphs and tables describing over twenty-five experimental survival rations tested on 85 human subjects for the Office of the Quartermaster General Results of studies of various phases of nitrogen metabolism, carbohydrate metabolism, electrolytic shifts, water balance and changes in circulation are demonstrated.

KURT LANGE, LINN J BOYD and DAVID WEINER, New York Medical College, New York

*Frostbite—Functional and Morphologic Pathology and the Prevention of Subsequent Gangrene* Exhibit showing how, by means of the fluorescein test, the sequence of events in frostbite as far as the vascular tree is concerned was investigated The initial stage of severe vasoconstriction is always followed by a state of complete restoration of circulation during which the capillary permeability is much increased During this stage silting of red cells, probably due to loss of plasma, takes place. These red cells are finally transformed into organized clots leading to subsequent gangrene If heparin is given early and long enough, this clot formation can be prevented Experiments on human volunteers, actual cases and pathologic specimens prove this fact Kodachromes, photomicrographs, drawings and charts illustrate the findings

EUGENE B FERRIS, GEORGE L ENGEL, MRS GEORGE L ENGEL, JOSEPH P WEBB, CHARLES D STEVENS and M A BLANKENHORN, University of Cincinnati and Cincinnati General Hospital, Cincinnati

*Nature of Decompression Sickness* Exhibit of charts and graphs illustrating the various clinical syndromes which make up the disease—decompression sickness, explaining the mechanism of each These syndromes include "bends," "chokes," skin lesion focal neurologic manifestations and syncope Evidence is presented to indicate that decompression sickness is due to distortion of tissue spaces by the formation of nitrogen bubbles It is shown that the symptoms are due to bubble formation in the tissue spaces and not in blood vessels The effect of preflight denitrogenation (100 per cent oxygen inhalation) in preventing decompression sickness is demonstrated

HAMILTON H ANDERSON, EDER LINDSAY HANSEN and HERBERT G JOHNSTONE, University of California Medical School, San Francisco

*Amebiasis Pathology Diagnosis and Chemotherapy* Exhibit stressing the pathology of amebiasis, with special reference to chronic, resistant cases and to frequent complications of the disease The differential diagnosis of amebiasis, especially from bacillary dysentery and other dysenteries due to animal parasites, is emphasized Complications, which are diagnostic problems requiring special awareness, such as abscess of the liver and other organs, are shown For control, the use of detergents in water and the usefulness of the traditional chemical types in therapy—emetine, arsenicals and the halogenated hydroxyquinolines plus new agents, now under trial, such as the arsine oxides, antibiotics, acridines and plant extractives—are featured

ARTHUR E MAHLE and HELEN M PATTON, Northwestern University Medical School and Wesley Memorial Hospital, Chicago

*Excretion of Vitamin A and Carotene as Influenced by Emollient and Hydrophilic Colloid Cathartics* Exhibit showing how blood and fecal vitamin A and carotene levels were estimated on 5 normal adult male medical students who were on a standard daily diet containing 4,000 international units of vitamin A for a period of fourteen months A gradual drop in the blood vitamin A was noted with a gradual increase in the blood carotene level When liquid petrolatum was given, the excretion of vitamin A and carotene increased When metamucil was given, no change was noted in the fecal vitamin A or carotene excretion

STANLEY C HARRIS and A C IVY, Northwestern University Medical School, Chicago

*Amphetamine Induced Weight Loss* Exhibit dealing with consideration of the several mechanisms which might act to cause weight loss (1) increased metabolism, (2) diuresis, (3) anorexia (*a*) peripheral (gastrointestinal) and (*b*) central

KARL H BEYER and WILLIAM P BOGER, Medical Research Division, Sharp and Dohme Inc, Glenolden, Pa

*Use of Sodium P-Aminohippurate and Mannitol in Renal Function* Exhibit showing a full color, diagrammatic representation of the nephron unit and its blood supply, so lighted as to simulate tubular function Charts describing the measurement of glomerular filtration and a description of the measurement of tubular excretion and renal blood flow Normal values for these functions are for men, women and children together

with an indication of the variation of these values in disease. Charts illustrating the clinical use and pharmacologic properties of mannitol and sodium p aminohippurate Graphic illustrations of the efficacy of sodium p aminohippurate in elevating penicillin plasma concentration by decreasing its renal tubular excretion and also the recent work on the use of mannitol as a diuretic agent are shown.

BERT R BOONE, FRED G GILLICK GEORGE C HENNY, MORTON J OPPENHEIMER and W EDWARD CHAMBERLAIN, U S Public Health Service and Temple University Medical School, Philadelphia

*The Electrokymograph A Recorder of Cardiovascular Motions* Exhibit presenting the electrokymograph, consisting of a photomultiplier tube which views heart border and great vessel motions appearing on a fluoroscopic screen and records them on an electrocardiographic string galvanometer For demonstration, a chest film placed on a special 14 by 17 inch illuminator is shown A pulsating phantom heart within the box superimposes its silhouette on the heart shadow of the film A photocell placed over the moving heart border is connected to the electrocardiographic string galvanometer In this way the phantom heart motion and the corresponding string movements may be viewed continuously during the exhibit. Charts, photographs and actual records of ventricular, auricular and great vessel motions are shown

### Section on Pathology and Physiology

The representative to the Scientific Exhibit from the Section on Pathology and Physiology is Frank W Konzelmann, Atlantic City, N J

H SIDNEY NEWCOMER and J C BURKE, E R Squibb and Sons New York and SCOTT M SMITH, HUGH O BROWN JAMES E P TOMAN and LOUIS S GOODMAN, University of Utah School of Medicine Salt Lake City

*Curare and Its Graded Pharmacologic Action* Exhibit showing source material for curare photomicrograph s and other data on active ingredients pharmaceutic forms, assay procedure, graded and progressively rising blood levels at which different muscle groups and nervous system units are affected with time elements of the rising and falling cycle together with outline and summary of the supporting data

W C HUEPER Warner Institute for Therapeutic Research, New York

*Etiology and Morphology of Arteriosclerosis* Exhibit of charts showing the various types of causes and causative mechanisms involved in the production of degenerative and proliferative vascular lesions of sclerotic and atheromatous character The different types of anatomic reaction products are presented in transparencies of photomicrographs prepared from lesions in man and experimental animals

S E GOULD Wayne County General Hospital and Infirmary, Eloise, Mich

*Control of Trichinosis in the United States* Exhibit presenting the principal features of the methods now used in the control of trichinosis and of a method advocated for adoption in the United States which is regarded as the simplest and most effective means for the control of this disease.

O B PRATT Institute of Experimental Medicine College of Medical Evangelists, Los Angeles

*The Rh Antigen Its Occurrence and Demonstration in Man and Animals* Exhibit of charts tables and photographs summarize the occurrence, genetic distribution and methods for recognizing the Rh group of antigens The information presented surveys the existing literature and presents original observations

HERBERT M EVANS and Associates Institute of Experimental Biology, University of California, Berkeley

*Hormones of the Anterior Hypophysis* Exhibit illustrating the chief results of some twenty years of pituitary research on the part of one group of investigators

CON FENNING C R MOTT and V E FENNING University of Utah School of Medicine, Salt Lake City

*Selective Physiologic Action of High Frequency Electrostatic Fields* Exhibit showing (1) oscillator audio-oscillator, modulating amplifier and accessory tuned circuit (2) the characteristics of the radio frequency current employed, the modulating signal the modulated wave form and the percentage of modulation, (3) typical results obtained from various preparations subjected to the field (4) the actual use of the equipment in securing 'selective results

E B POTTER JOEL W BAKER and THOMAS B CARLILE JR. Virginia Mason Hospital, Seattle

*The Cancer Clinic of the Virginia Mason Hospital Seattle* Exhibit of (1) charts showing the formation and the functions of a cancer clinic and its usefulness to a practitioner (2) illustrative photographs of a variety of cancers as visualized by roentgenograms gross pathologic changes and a few pertinent photomicrographs, (3) pictures of cancer cases before and after treatment, and data regarding the choice of treatment

### Section on Nervous and Mental Diseases

The representative to the Scientific Exhibit from the Section on Nervous and Mental Diseases is Frederick P Moersch, Rochester, Minn.

A E BENNETT A R. MCINTYRE and PAUL T CASH University of Nebraska College of Medicine, Omaha

*Comparison of Curarization with Myasthenia Gravis* Exhibit showing how with in vitro and in vivo experiments on muscle nerve preparation with curare, physostigmine (eserine), prostigmine and acetylcholine, the mechanism of curarization has been critically examined and new data obtained indicating the inadequacy of previous views concerning curarization Many striking parallels between curarization and myasthenia gravis have been established Clinical application includes a new diagnostic test and prognostic aid in the disease

A. L SAHS and CLARK H MILLIKAN State University of Iowa College of Medicine and University Hospital Iowa City

*Ruptured Intracranial Aneurysms* Exhibit of gross photographs, photomicrographs and drawings of the developmental anomalies of the circle of Willis and the production of congenital aneurysms of the circle incidence of aneurysms seen at University Hospital Iowa City gross and microscopic pathologic changes clinical features, diagnosis and differential diagnosis prognosis treatment and arteriography

GEORGE S BAKER and ARTHUR H BULBULIAN Mayo Clinic Rochester Minn.

*New Method for Molding of Tantalum Plate in Cranioplastics* Exhibit demonstrating the method by the use of a series of plaster masks and moulages accompanied by photographs and roentgenograms of patients on whom cranioplastics have been performed

C WILBUR RUCKER Mayo Clinic, Rochester Minn

*The Fundus of the Eye in Disorders of the Central Nervous System* Exhibit of enlarged transparencies of the fundus oculi illustrating the manifestations in the eye of various disorders of interest to the neurologist and stressing especially the differential diagnosis of abnormal fulness of the optic disk.

J M NIELSEN KARL O VON HAGEN and GEORGE N THOMPSON University of Southern California, Los Angeles

*Focal Cerebral Lesions with Mental Symptoms* Exhibit of preserved specimens of brain in addition to photographs, showing focal cerebral lesions

WALTER L BRUETSCH and MAY A BAHR Central State Hospital, Indianapolis, WALTER CLARKE American Social Hygiene Association, New York and CONRAD BERENS, National Society for the Prevention of Blindness, New York

*Syphilitic Optic Atrophy—Pathogenesis and Treatment* Exhibit of photographs and sections of optic nerves chiasm and optic tracts showing the tissue changes which lead to optic

atrophy Demonstration of syphilitic optochiasmatic arachnoiditis and its relation to atrophy of the optic nerves The successes and failures of present day treatment of syphilitic optic atrophy become more clearly understood on the basis of the underlying pathologic condition as presented in the exhibit.

HENRY W NEWMAN, Stanford University School of Medicine, San Francisco

*Methods of Electrical Testing in Peripheral Nerve Injuries* Exhibit demonstrating an apparatus suitable for determination of strength duration curves, chronaxia and tetanus-twitch ratio There is graphic representation of the findings in cases of peripheral nerve injuries, both spontaneously recovered and recovered after suture, with an evaluation of the different tests in diagnosis and prognosis

EDWIN B BOLDREY and EARL R MILLER, University of California Medical School, San Francisco

*Carotid Arteriography* Exhibit of roentgenograms showing external and internal carotid vessels, their branches and venous connections in some normals, saccular aneurysms, arteriovenous aneurysms, congenital malformations and tumors

J JAY KEEGAN and FREDERIC D GARRETT, University of Nebraska College of Medicine Omaha

*Cutaneous Distribution of Segmental Nerves in Man* Exhibit based on clinical and experimental outlining of dermatome areas of reduced pain sensation or hypalgesia produced by compression, stretching section and procaine injection of single nerve roots of the leg and arm From this a new conception and chart of cutaneous distribution of segmental nerves in the extremities is presented, with comparison with dermatome charts of previous investigators The clinical application of this knowledge is shown in two sections one with portrayal of anatomic and pathologic factors involved in single nerve root compression by herniation of an intervertebral disk and the other showing radiologic factors involved in localization of a nerve root compression syndrome.

## Section on Dermatology and Syphilology

The representative to the Scientific Exhibit from the Section on Dermatology and Syphilology is Hamilton Montgomery, Rochester, Minn, and Francis W Lynch, St Paul, Minn, is assistant representative

LOUIS SCHWARTZ, SAMUEL M PECK ISADORE BOTVINICK and A L LEIBOVITZ, U S Public Health Service, Bethesda Md

*Control of Epidemic Ringworm of the Scalp* Exhibit showing the incidence of ringworm of the scalp in the United States and in the schools of Hagerstown, Md Charts describe the methods used for controlling epidemics, including sanitation of barber shops, setting up of treatment clinics in the schools, method of identifying cases by means of Wood's light method of sterilizing electric clippers and other barbers instruments, evaluation of various topical applications for treatment and cultures of Microsporon audouini Photographs of actual cases are shown

BENJAMIN S KLINE, Mount Sinai Hospital, Cleveland

*New Development Toward a Single Standard Blood Test for Syphilis Cardiolipin-Lecithin Antigen* Exhibit showing the steps in the simplification of technic of tests for syphilis from complex, time consuming complement fixation type (five ingredients) to rapid tube and slide flocculation types (two ingredients) Furthermore, it shows the steps in the improvement of the antigen from saline extracts to crude alcoholic extracts to purified alcoholic extracts and most recently to essentially chemically pure lecithin and cardiolipin first isolated by Pangborn in 1941 Outlines of desirable future studies are included.

FRANCESCO RONCHESE, Providence, R I

*Occupation Marks as Aids to Personal Identification* Exhibit of photographs and drawings of calluses, cicatrices and other marks produced by various occupations or remnants of operation or disease The drawing shows the worker handling the tool or in the position producing the mark The marks are grouped according to their usefulness as an aid to personal identification, the very useful because found only in one occupation or one disease, the moderately useful because shared by more than one occupation or disease, and the rare or obsolete interesting only for their peculiarities

JOHN H LAMB and EVERETT S LAIN, Oklahoma City

*Actinomycosis of the Face and Neck* Exhibit of colored photographs of 14 cases of the anaerobic type of cervicofacial actinomycosis and 1 case from which an aerobic actinomycete was isolated The various clinical types are described, with charts showing the most successful type of treatment. A large map of the United States demonstrates the distribution of cases of actinomycosis from 1920 to 1940 Photomicrographs of various types of granules will be shown The various species of actinomycetes are described and the oral cavity as a focus of infection, particularly chronic actinomycetic periodontitis, is stressed.

THOMAS W NISBET, Pasadena, Calif

*Atabrine Dermatitis* Kodachrome transparencies showing the characteristic types of eruption occurring in patients following the chronic administration of atabrine

## Section on Preventive and Industrial Medicine and Public Health

The representative to the Scientific Exhibit from the Section on Preventive and Industrial Medicine and Public Health is Paul A Davis, Akron, Ohio

VICTOR ROSS, College of Physicians and Surgeons, Columbia University, New York

*Immunization with Protamine-Diphtheria Toxoid* Exhibit showing the results of immunization of 4,000 children with protamine-diphtheria toxoid Charts showing (1) results of Schick test on groups of children at different intervals following the injection, (2) antitoxin titers produced (3) data obtained on the areas of erythema produced following simultaneous intradermal injection of equivalent quantities of protamine, alum and "fluid" toxoid in adults, (4) nitrogen content per Lf unit of the new preparation compared with that of alum and 'fluid" toxoids

W W BAUER and WILLIAM W BOLTON Bureau of Health Education, American Medical Association, Chicago

*Electrically Transcribed Radio Programs for County Medical Societies* Exhibit from the Bureau of Health Education, with a map showing the distribution of its electrically transcribed radio broadcasts for county medical societies plus sample copies of the scripts, and charts and posters showing how county medical societies can get the records for local use. Pamphlet listings of available transcriptions will be distributed Sample transcriptions will be available for listeners Headphones are included, so that persons can listen to the programs

## Section on Urology

The representative to the Scientific Exhibit from the Section on Urology is John H Morrissey, New York

THOMAS L GIBSON, San Francisco

*Hydronephrosis—Classification and Plastic Repair of Ureteropelvic Obstructions* Exhibit demonstrating types of hydronephroses and pyeloplastic procedures for their correction combined with methods of ureteral splinting together with nephrostomy and pyelostomy drainage

ROGER W BARNES and MALCOLM R HILL, College of Medical Evangelists School of Medicine, Los Angeles

*Intestinovesical Fistula* Exhibit of drawings and posters illustrating the causes, diagnostic procedures and treatment of intestinovesical fistulas The difficulties and importance of diagnosis are illustrated

JOHN O RAO, Mercy Hall Hospital for Cancer, Detroit

*Urologic Complications in Carcinoma of Cervix* Exhibit of moulages showing relations of ureters to cervix and para

metrium and the way in which the spread of carcinoma produces urinary obstruction, moulage illustrating mechanism of fistula formation drawings illustrating roentgen ray findings and path findings at postmortem in the same case, drawings illustrating paths of extension and amount of disease at necropsy survival period after onset of urinary obstruction and fistula formation, charts indicating in what cases urinary complication resulted from carcinoma, adhesions or radiation necrosis

ROBERT H HERBST and JAMES W MERRICKS, University of Illinois (Rush) College of Medicine and Presbyterian Hospital, Chicago

*Transurethral Drainage of Seminal Vesicles* Exhibit of roentgenograms showing the seminal tract in health and disease with case histories also drawings illustrating technic Transparent cleared specimens of seminal tract, bladder neck and bladder are shown.

FREDERIC E B FOLEY, St. Paul

*An Artificial Sphincter A New Operation and Device for Control of Urinary Incontinence* Exhibit of drawings illustrating technic of operation display of samples of the artificial sphincter and inflating device, and a mannequin demonstrating operation of the device.

### Section on Orthopedic Surgery

The representative to the Scientific Exhibit from the Section on Orthopedic Surgery is David M Bosworth, New York.

S L HAAS, Stanford Medical School San Francisco

*Fusion of Vertebral Bodies After Resection of the Intervertebral Disk* Exhibit showing series of experiments performed on dogs at various ages in which the intervertebral disk was removed as thoroughly as possible, first, by a transabdominal approach, second, by laminectomy, and, third, by lateral extraperitoneal approach Various degrees of fusion were obtained depending possibly on age and thoroughness of the operations Studies include the second changes on the articular facets degree of fixation, deformity and injury to the cord and nerve tissue.

WILLIS C BEASLEY, United States Public Health Service, Bethesda, Md.

*Electronic Myodynemetry* Exhibit showing new method for measuring muscular strength using specially designed electronic instruments The technic is adapted particularly to force measurement (in pounds) in testing procedures typically employed by physical therapists on infantile paralysis patients Procedures utilized in calibrating the test instruments are demonstrated. Data showing typical measurements obtained for various muscle action on normal and clinical patients are displayed The method is of interest to those concerned with muscular dysfunction and rehabilitation. Special demonstrations daily at 10 00 a m and 3 00 p m

GUY A CALDWELL, FRANCIS M MCKEEVER and A R SHANDS JR American Board of Orthopedic Surgery and Joint Committee on Graduate Training New Orleans

*The American Board of Orthopedic Surgery and the Joint Committee on Graduate Education* Exhibit of maps indicating location of hospitals with approved resident training in orthopedic surgery tables showing the numbers of applicants and vacant positions and posters relative to board requirements for parts I and II of the examinations Essential requirements for approval of resident training and practice by the Council on Medical Education and Hospitals are shown Pamphlets and booklets, both pertinent information relative to these subjects, will be distributed.

JOHN LYFORD III, ROBERT W JOHNSON JR. and ROGER B SCOTT, Johns Hopkins Hospital, Baltimore

*The Donovan Body,' An Organism Causing (1) Generalized Granuloma Inguinale (2) Osteomyelitis and (3) Polyarticular Arthritis* Exhibit showing that granuloma inguinale is a systemic as well as a local disease and that the 'Donovan body" as the causative organism of one form of polyarticular arthritis and osteomyelitis has been demonstrated in pathologic sections and "continuous tissue cultures" of material from the involved bones and joints Microscopic sections photographs and transparencies, roentgenograms, charts and photomicrographs demonstrate these findings

H H YOUNG and R K GHORMLEY, Mayo Clinic, Rochester, Minn

*Accidents on the Farm and How They Happen* Exhibit presents a statistical analysis of 575 typical fatal and nonfatal farm accidents seen at the Mayo Clinic from 1934 to 1944 It emphasizes the common causes of these accidents and stresses the means of preventing them

LAURENCE JONES, Beverly Hills Calif

*Sciatic Neuritis and Low Back Pain—A Different Cause and Treatment The Pronation Syndrome* Exhibit showing that faulty foot posture is the primary cause of sciatic neuritis An individual method of correction brings prompt and consistent relief from pain In a large series of cases, disk protrusion was of little or no clinical importance.

NICHOLAS S RANSOHOFF, Monmouth Memorial Hospital, Long Branch N J

*Purified Curare in the Treatment of Acute Anterior Poliomyelitis* Exhibit showing central black and white poster on which the electromyographic stories of the treatment of poliomyelitis are reviewed photographs of action currents of muscles showing the effects of purified curare and physical therapy Muscles are traced from a complete paralysis through recovery on to complete function. Mounted silhouettes show the physical therapy technics involved. A large number of myographs in book form are included as well as a two channel electromyograph to demonstrate action currents

COMMITTEE ON PROSTHETIC DEVICES National Research Council, Northwestern Technological Institute, Evanston Ill

*New Developments in Artificial Limbs* Exhibit presenting the results of the program of the Committee on Prosthetic Devices of the National Research Council, which has had an extensive research and development program under way for over a year It contains varied illustrative material examples of new devices and mechanisms results of basic studies on human locomotion and new developments in methods of fitting artificial limbs

### Section on Gastro-Enterology and Proctology

The representative to the Scientific Exhibit from the Section on Gastro Enterology and Proctology is Grant H Laing Chicago

LEO L HARDT, JOHN S COULTER FREDERICK STEIGMANN and JACK I RABENS Cook County Hospital, Cook County Graduate School the Loyola University Medical School Northwestern University Medical School University of Illinois College of Medicine the Illinois Central Hospital and the Chicago Municipal Tuberculosis Sanitarium, Chicago

*Gastroscopic Studies in the Diagnosis and Treatment of Gastric Diseases* Exhibit presenting slides, roentgenograms and artist s drawings through the gastroscope showing the value of gastroscopy in the diagnosis of gastric diseases and also exhibiting various pathologic conditions as found in a large group of patients (3 600) examined during six years The appearance of the gastric mucosa after various medications is demonstrated by several colored plates (artist s drawings)

HAROLD LINCOLN THOMPSON, JOSEPH M OYSTER, JOHN B HEID and FRANK M MORGAN, Los Angeles

*Hematemesis—An Analysis of Underlying Pathologic Changes* Exhibit of charts photographs, roentgenograms and drawings resulting from a study of 300 cases of hematemesis

LESTER M MORRISON Los Angeles

*Improved Methods in the Treatment of Cirrhosis of the Liver* Exhibit dealing with small but carefully controlled series of 62 patients with chronic hepatitis treated by three

separate methods over a period of eight years One group of 23 patients was treated by the methods commonly in use in 1938, a second group of 19 was treated by a "modified Patek" regimen, a third group of 20 patients was treated by a method using choline and methionine in combination, a special protein diet, a new liver extract and various vitamin adjuncts An analysis is presented of the sharp reduction in mortality and morbidity rate in the third therapeutic group, using new and improved methods of treatment for cirrhosis of the liver applied by the exhibitor

BENJAMIN M BERNSTEIN, Brooklyn Jewish Hospital, Brooklyn

*Histamine in the Therapy of Peptic Ulcer* Exhibit describing the study of more than 60 cases treated by injection of histamine No other medication, except belladonna in a few cases, was used. Relief from pain was rapid in most cases, symptoms were aggravated in none It would seem that the continuance of acidity does not interfere with the relief from the symptoms of the ulcer syndrome but permits the recurrence to abate quickly and in some instances permits the ulcer deformity to modify its appearance and even disappear

### Section on Radiology

The representative to the Scientific Exhibit from the Section on Radiology is S W Donaldson, Ann Arbor, Mich

SAMUEL BROWN, Jewish Hospital, Cincinnati

*Roentgen Study of Duodenum* Exhibit showing illustrations of the normal duodenum as revealed in the ventral and right lateral projections with its relationship to the stomach, pancreas liver, gallbladder, extrabiliary ducts, right kidney and spine Illustrations showing the frequent advantage of the lateral projection over the ventral in demonstrating intrinsic lesions of the duodenum. Illustrations of alterations in the position, shape and contour of the duodenum produced by abnormal changes in the adjacent structures which are often characteristic for the organs involved, enabling one to arrive at a more accurate diagnosis

WILBUR BAILEY, University of Southern California Medical School, Los Angeles

*Spondylolisthesis—A Congenital Anomaly Frequently Unaccompanied by Symptoms* Exhibit of roentgenograms, posters and placards showing the main points of spondylolisthesis and its precursors Special attention is directed to the congenital origin of this disease and the fact that it is frequently discovered in the absence of symptoms

CALVIN L STEWART and FREDERICK B WAGNER JR, Jefferson Hospital, Philadelphia

*Abdominal Aortography* Exhibit describing the technic of introducing suitable contrast mediums into the abdominal aorta by the translumbar route, with photographs and illustrations Several cases are exhibited by showing reproductions of the actual films exposed with the contrast medium in place, the diagnostic problem involved in each case is stated to show the indication for the examination, the conclusions of each examination are enumerated.

L H GARLAND, H A HILL and M E MOTTRAM, San Francisco

*Pancreatic Calcifications* Exhibit illustrating the diagnostic features of the various types of pancreatic calcification and the differential diagnostic points between calculous and parenchymal calcification

### Section on Anesthesiology

The representative to the Scientific Exhibit from the Section on Anesthesiology is Urban H Eversole, Boston.

URBAN H EVERSOLE, MORRIS J NICHOLSON and LEO V HAND, the Lahey Clinic, Boston

*Anesthesia for Thyroid Surgery* Exhibit showing the importance of the preoperative visit by the anesthesiologist, premedication ordinarily used and an evaluation of the various anesthetic agents The indications for and technic of endotracheal anesthesia are presented The explosion hazard associated with inhalation anesthesia is mentioned and a means of safeguarding against it is presented Attention is focused on the management of such complications as excess mucus in the tracheobronchial tree, hyperactive carotid sinus reflex and severe exophthalmos A safe method of controlling the anesthesia for tracheotomy is demonstrated

HUGH O BROWN, University of Utah Medical School, Salt Lake City and JAMES M THOMSON, Minneapolis

*Continuous Caudal Technics* Exhibit of plaster models depicting steps in continuous caudal catheter technic. Charts show the history, classification of technics, indications, contra indications, drugs and concentrations in use, preparation of solution and tabulated results in 500 cases employing pontocaine epinephrine solution Skeletal model, sagittal section and equipment are included

ELMER C BARTELS and GEORGE O BELL, the Lahey Clinic, Boston

*Use of Thiouracil in Preparation of Patients with Severe Hyperthyroidism for Thyroidectomy* Exhibit reviewing the experience obtained from the use of thiouracil as a preoperative drug on 400 patients with severe hyperthyroidism. A practical demonstration of the value of thiouracil with indications as to its use and dangers is shown

H C SLOCUM, E A HOEFLICH and C R. ALLEN, Texas University School of Medicine, Galveston

*Malpositions on the Operating Table* Exhibit of photographs, charts and demonstrations to show the effects on anesthetized patients of malpositions on the operating table as recorded by respiratory, circulatory and nervous system changes

JOHN ADRIANI and RAY T PARMLEY, Charity Hospital and Louisiana State University School of Medicine, New Orleans

*Saddle Block Anesthesia* Exhibit describing a new technic with details and results Saddle block anesthesia is a form of low spinal anesthesia confined to the perineal area. When nupercaine is used, prolonged analgesia is obtainable. This has been used for relief of pain of labor and for deliveries in obstetrics Exhibit emphasizes this aspect but also describes its value for general surgery

WILLIAM B NEFF and RICHARD C GILL, Stanford University School of Medicine, San Francisco

*Curare in Anesthesiology* Exhibit showing the transition of curare from a drug of use only in the jungle to its present clinical importance in medicine, illustrated by photographs, charts, specimens and pictures taken in the curare country at the headwaters of the Amazon The method of primitive curare production and its ethnobotany is shown together with photographs illustrating its clinical application in anesthesiology

### Section on General Practice of Medicine

#### Miscellaneous Exhibits

The representative to the Scientific Exhibit from the Section on General Practice of Medicine is Wingate M Johnson Winston-Salem, N C A group of miscellaneous exhibits is included under this section

VICTOR JOHNSON, F H ARESTAD, M G WESTMORELAND and FRODE JENSEN, Council on Medical Education and Hospitals, American Medical Association, Chicago

*Medical Education and Hospital Service* Exhibit featuring educational facilities for physician veterans and giving information regarding medical schools, internships, residencies in specialties, schools for medical record librarians, occupational therapists, physical therapists and x-ray and laboratory technicians, annual census of hospitals for 1945, revised data on medical education and licensure, and lists of approved medical schools, internships, residencies and approved technical schools

CHARLES R REYNOLDS and BOWMAN C CROWELL, American College of Surgeons, Chicago

*Graduate Training for Surgery, Cancer Clinics* Exhibit of posters and charts demonstrating aims, scope and function of

graduate training program Progress of cancer clinic program is shown also

LOUIS I DUBLIN, Metropolitan Life Insurance Company, New York

*Cancer Facts* Exhibit of charts showing (1) the facts behind the increasing death rate from cancer in the United States—effects of aging population and advances in medical diagnosis (2) current cancer facts—relative importance of cancer as a cause of death as compared with other numerically important diseases, share of cancer of all deaths in various age groups, comparison of urban and rural cancer mortality rates, the chief sites of cancer in men and women cancer mortality by age, men and women compared, and (3) recent progress in cancer control, with special emphasis on the decreases in mortality from cancer among women since 1931-1935

P R HAWLEY, Veterans Administration, Washington

*Activities of the Veterans Administration Department of Medicine and Surgery* Exhibit of charts and pictographs showing the organization, plans and policies of the Veterans Administration

WILLIS S KNIGHTON and VIRGINIA M SMITH, Committee on Glaucoma, National Society for Prevention of Blindness, New York

*The Physician Saves Sight Through Early Recognition of Glaucoma* Exhibit consisting of charts, posters and graphic devices illustrating signs and symptoms easily recognizable during a general physical checkup Testing equipment and technic will be included.

GEORGE W COOLEY, Council on Medical Service and Public Relations, and CHARLES E. NYBERG Bureau of Medical Economics, American Medical Association, Chicago

*Prepayment Medical Care Plans* Exhibit of maps showing areas covered by prepayment medical care plans, types of plans in operation, and extent of cooperation with Blue Cross Plans, together with charts showing growth in the number of plans and in enrolment, and the various types of benefits, premiums, waiting periods exceptions and the like. Prepayment plan pamphlets and sample copies of operative forms and promotional material will be available.

M VIRGINIA SHULER, Bureau of Information, American Medical Association, Chicago

*Rural Medical Service* Exhibit showing a map of the United States with the physician population ratio by counties, charts and posters giving the relations between the Bureau of Information and other organizations, such as hospitals, the Farm Bureau and the Farm Foundation. Pamphlets on rural medical service will be available.

J LOUIS NEFF, American Cancer Society, New York, and THEODORE CURPHEY, American Society of Clinical Pathologists, Garden City, N Y

*Teamwork In Cancer Diagnosis* Exhibit of transparencies and diagrammatic sketches presenting problems of differential diagnosis. Early cancer cannot be diagnosed by clinical evidence alone but requires the teamwork of the pathologist, the surgeon and the roentgenologist as well as the original clinician The efficacy of teamwork in the diagnosis of such common lesions as cancer of the skin, cervix and breast is demonstrated Since the one fundamental and essential approach to the correct treatment of cancer is the pathologic diagnosis, the method of taking adequate and correct biopsy material is graphically illustrated Emphasis is given to selection of the site, method of removal and correct handling of the material

## INFANTILE PARALYSIS—1946

The following group of exhibits show the results of some of the research studies supported by the National Foundation for Infantile Paralysis

HUBERT S LORING, Stanford University Medical School, San Francisco

*Virus Research* Methods of purification and determination of characteristics of the poliomyelitis virus

VERNE T INMAN, JOHN B SAUNDERS and LEROY C ABBOTT, University of California Medical School, San Francisco

*Body Mechanics* A graphic visualization of the rhythm of action of muscles of the shoulder joint

KARL F MEYER, W McD HAMMOND, W C. REEVES and WALTER N MACK, University of California and the George Williams Hooper Foundation, San Francisco

*Epidemiology* A visual demonstration of the host factors and transmission in poliomyelitis, the epidemiology and the differential diagnoses of the St. Louis and western equine encephalitides

HAROLD K FABER, Stanford University Medical School, San Francisco, KENNETH F MAXCY, HOWARD A HOWE and DAVID BODIAN, Johns Hopkins University, Baltimore

*Pathology* The distribution of poliomyelitis lesions and sources of virus recovery in the human being, also the chromatolysis of the nerve cells

ROBERT S SCHWAB MARY A B BRAZIER and ARTHUR L WATKINS, Massachusetts General Hospital, Boston

*Muscle Function* Electromyograph and ergograph studies of muscle function in normal and in paralyzed muscles

LUCILLE DANIELS WILLIAM H NORTHWAY and E. B SHAW, Stanford University Medical School, San Francisco

*Treatment* The acute diagnostic signs of infantile paralysis, the phases of treatment and the technic of muscle testing

CHARLES L LOWMAN, Orthopedic Hospital, Los Angeles

*Orthopedic Surgery Rehabilitation* Visual evidence of correction of orthopedic deformities through orthopedic surgery consisting of a series of translights showing "before and after" views of actual cases

## MOTION PICTURE PROGRAM

SIX motion picture theaters will be in operation continuously throughout the week. One of these will be in the Civic Auditorium in connection with the Special Exhibit on Physical Medicine. (For titles see Special Exhibit on Physical Medicine.)

FIVE motion picture theaters will be located in the Veteran's Building, Civic Center, where the following films will be shown once each day on a prearranged schedule

### Motion Pictures on Internal Medicine

CARROLL L BIRCH and LOUIS R LIMARZI, University of Illinois College of Medicine, Chicago

*Animated Hematology* Motion picture on physiology and pathology of hemopoietic principle. This includes clinical cases, kodachrome photomicrographs of blood and bone marrow and outlines the treatment of pernicious anemia, sprue, cirrhosis of the liver and aplastic anemia Silent, color, 50 minutes

CLAYTON J LUNDY, Presbyterian Hospital, Chicago

*The Electrocardiogram and Heart Sound Records in Rheumatic Heart Disease* Motion picture showing the formation of early and late electrocardiographic changes which take place in rheumatic heart disease. Electrocardiogram formation is depicted simultaneously with heart action. The abnormal heart sounds heard in rheumatic heart disease are demonstrated as they occur simultaneously with electrocardiogram formation and heart action The relationships of normal heart sounds are shown first, then various types of systolic and diastolic murmurs The differentiation of the diastolic murmurs heard in aortic and mitral valve disease is emphasized Silent, 50 minutes.

K. J HENRICHSEN and RICHARD DAVISON, Municipal Tuberculosis Sanitarium, Chicago

*Collapse Therapy in Pulmonary Tuberculosis* Motion picture demonstrating pneumothorax, phrenicectomy, extra pleural pneumothorax, pneumolysis and thoracoplasty Silent, color, 20 minutes

## Motion Pictures on Surgery

JAMES BARRETT BROWN and FRANK McDOWELL, Washington University School of Medicine, St Louis

*Support of the Paralyzed Face by Fascia* Motion picture showing how in cases of facial paralysis which are not amenable to nerve operations a worth while result can be obtained by connecting the face to the temporalis muscle with strips of fascia lata This maintains the face in a good level position in repose and permits a small amount of movement which is of definite value in facial expression Good control of the mouth is obtained, permitting the patient to smoke, eat and drink in public without embarrassment. Silent, color, 15 minutes

CONARD R LAM, Henry Ford Hospital, Detroit

*Repair of Congenital Tracheoesophageal Fistula with Atresia* Motion picture consisting of a pictorial case history of an infant born with atresia of the esophagus and tracheoesophageal fistula. The chief points in the establishment of the diagnosis are outlined. The preferred operation of ligation of the fistula and direct anastomosis of the segments of the esophagus within the mediastinum is demonstrated Postoperative care and outpatient follow-up are depicted Silent, color, 12 minutes

A. H WHITTAKER, Harper Hospital, Detroit

*Inter-Innomino-Abdominal Amputation* Motion picture presents indications for 'hind quarter amputation" It shows by animated drawing the anatomic landmarks and the technic of the operation. Roentgenograms are reproduced, and the end result is illustrated Silent, color, 11 minutes

THOMAS A SHALLOW, Jefferson Medical College Hospital, Philadelphia

*Extraperitoneal Closure of Colostomy* Motion picture showing both diagrammatically and actually how the spur of a double barrel colostomy is crushed by means of a specially devised clamp, followed by the various steps in closure of the colostomy by the extraperitoneal method Silent, color, 16 minutes

RALPH HERZ, Cleveland

*Subfascial Fat Herniation* Motion picture of dissection on cadavers showing basic fat pattern in the gluteal and lumbar regions of the back. Clinical diagnosis locating hernia, injection of hernia with local anesthetic and effect of injection on patients are portrayed. Technic of operation, demonstration of postoperative results, summary and conclusions are given. Silent, color, 15 minutes

VIRGINIA KNEELAND FRANTZ, Columbia University College of Physicians and Surgeons, New York

*Hemostasis with Oxidized Cellulose (Absorbable Gauze and Cotton)* Motion picture showing a few simple chemical tests of oxidized cellulose in the form of surgical gauze, i e. solubility, and combination with hemoglobin and with whole blood The technic of testing absorbable materials in subcutaneous tissue of rats is shown, followed by operative procedures in dogs and human beings in which bleeding is controlled by the hemostatic sponge Autopsy of the dog four and one-half weeks postoperative is shown Silent, color, 25 minutes

HILGER PERRY JENKINS, RUDOLPH JANDA, HOWARD OWENS and EDWARD SENZ, University of Chicago, Billings Hospital, Chicago

*Gelatin Sponge Studies on Hemostatic Action* In experimental resection of segment of liver the gelatin sponge was used to control the bleeding without the addition of thrombin or the use of any suture material In addition studies have been conducted on injuries of large veins the hemorrhage from which was controlled by the application of gelatin sponge alone. Silent, color, 10 minutes

RICHARD B CATTELL, Lahey Clinic, Boston

*Pancreatoduodenal Resection for Carcinoma* Motion picture showing two stage operation. The operative findings and technic of cholecystojejunostomy are portrayed, together with the steps of removal of the pyloric end of the stomach, lower end of the common duct, head of the pancreas and the duodenum. The procedure emphasizes implantation of the duct of Wirsung into the jejunum Silent, 50 minutes

ARKELL M VAUGHN, Loyola University School of Medicine and Mercy Hospital, Chicago

*Partial Resection of the Stomach (Gastrectomy), with Antecolic Terminolateral Gastrojejunostomy* Motion picture reviewing the history of gastric resection Symptoms of carcinoma of the stomach are discussed and roentgenographic diagnosis of the carcinoma of the stomach to be removed is shown. Detailed preoperative preparation and postoperative care are discussed. The technic of nupercaine spinal anesthesia is shown. Silent, color, 30 minutes

HARRY E BACON, Temple University Medical School and Hospital, Philadelphia

*Abdominoperineal Proctosigmoidectomy Without Colostomy and With Preservation of Sphincter Musculature* Motion picture showing the technic of operation, with the rates of operability, resectability mortality, morbidity and survival It is based on 460 cases of cancer of the sigmoid and rectum. Silent, color, 30 minutes

JEROME M LYNCH and G JOHNSON HAMILTON, New York Polyclinic School and Hospital, New York

*The Lynch Operation for Carcinoma of the Rectosigmoid* Motion picture depicting the technic of the operation and permitting exaggeration of the salient points Selected pictures taken during various operations present each maneuver There are also shown a series of pictures of the various stages of healing and stoma formation from twenty-four hours to ten years after operation, together with Broders and Duke's classification of the tumor, its distance from the anal verge and the length of the specimen removed. Silent, 23 minutes

TIBOR DE CHOLNOKY, New York Postgraduate Hospital and Medical School, Columbia University, New York

*Surgery in Facial Cancer* Motion picture of an operation consisting of a radical excision of a post radiational recurrent carcinoma of the nose with immediate reconstruction of the resected and recurrent cancer of the nose. The second series of pictures shows a recurrent advanced cancer of the orbit, paranasal sinuses and cheek. The preoperative condition and the resulting defects after electrocoagulation are shown, with steps of reconstruction and follow-up Silent, color, 12 minutes

*Electrocoagulation in Advanced Cancer of the Rectum* Motion picture showing electrocoagulation for an advanced recurrent cancer of the rectum, with operative procedure and palliative result Silent, color, 10 minutes

## Motion Pictures on Obstetrics

A HERBERT MARBACH, Jewish Hospital, Philadelphia

*Vaginal Flora During Pregnancy* Motion picture showing normal and abnormal flora during pregnancy with associated *pn* changes and showing gross changes of vagina. Silent, 20 minutes

## Motion Pictures on Ophthalmology

LOUIS LEHRFELD, Wills Eye Hospital, Philadelphia

*Herbert Operation for Glaucoma* Motion picture of an old operation under modern conditions of surgery, with slight modification of technic, is reviewed pictorially in color The simplicity of the operation and freedom of complications make it an important contribution to the treatment of glaucoma. Silent, color, 20 minutes

RUDOLPH JAEGER, Jefferson Medical College and Hospital, Philadelphia

*Intracranial Removal of Intraorbital Tumor* Motion picture showing a dermoid cyst of the orbit causing proptosis and *double vision which could not be safely removed* by anterior approach to it. The tumor is shown being removed by means of a craniotomy opening above the orbit and removal of the top of this structure. Through this opening exposure was adequate to remove completely the circumscribed cystic tumor Silent, 15 minutes

JACK S GUYTON, Wilmer Institute, Johns Hopkins Hospital, Baltimore

*Ptosis Operations* Motion picture showing three different types of ptosis operations, including a Blascovicz operation, a Dickey operation and a Friedenwald operation Indications for these different types of operations are noted Silent, color, 39 minutes

### Motion Pictures on Laryngology, Otology and Rhinology

PAUL H HOLINGER and ALBERT H ANDREWS JR, University of Illinois College of Medicine, Chicago

*Endoscopic Photography in Otolaryngology and Bronchoesophagology* Motion picture showing the areas visualized by the otolaryngologist in routine examination of the ear, nose and throat. Pictures of the ear drum, the anterior nasal chamber and the postnasal space, the hypopharynx and the larynx are shown as they are seen through the ear speculum and the nasal speculum or with postnasal or laryngeal mirrors Direct views of the larynx, the tracheobronchial tree and the esophagus are shown taken through the laryngoscope, bronchoscope and esophagoscope The normal anatomy and commoner pathologic entities are shown Silent, color, 48 minutes

IRVING REHMAN and PAUL R PATEK, University of Southern California School of Medicine, Los Angeles

*High-Speed X-Ray Motion Pictures of Swallowing and Joint Actions* Motion picture presenting an analysis of swallowing in normal and pathologic states, and bizarre types resulting from partial bulbar palsy or stricture of the esophagus, and a preliminary study of normal joint actions of the upper and lower extremities Silent, 20 minutes

### Motion Pictures on Experimental Medicine and Therapeutics

H SIDNEY NEWCOMER, E R Squibb and Sons, New York, HARRISON FLIPPIN, Philadelphia General Hospital, Philadelphia, T R HELLER U S Public Health Service, Bethesda, Md., and FRANK L. MELENEY, Presbyterian Hospital, New York

*Penicillin Therapy* Motion picture presenting the therapy with penicillin in internal medicine, venereal disease and surgery The principles of penicillin therapy are demonstrated by example and precept both in medicine and in surgery Sound, color, 40 minutes

MICHAEL HENRY STREICHER, University of Illinois College of Medicine Chicago

*The Use of Phthalylsulfathiazole in Chronic Ulcerative Colitis* Motion picture presenting in brief form the pharmacologic aspects of the new intestinal bacteriostatic agent phthalylsulfathiazole. It outlines the toxicology and indicates the dosage of the drug, it presents the clinical indications and presents the results obtained following treatment. It also shows the studies made on the bacteriology of the stools, the blood level concentrations and also stool concentrations Sound, color, 15 minutes

### Motion Pictures on Nervous and Mental Diseases

L M EATON and O T CLAGETT, Mayo Clinic, Rochester, Minn

*Myasthenia Gravis* Motion pictures of patients undergoing tests are presented to illustrate the three general groups of myasthenic symptoms (1) ocular symptoms, (2) bulbar symptoms and (3) generalized weakness with only minimal symptoms of groups 1 and 2 The therapeutic tests with neostigmine, quinine and curare are illustrated The relationship of myasthenia gravis and the thymic tumor is portrayed by pictures of roentgenograms and operative findings Silent, 20 minutes

A E BENNETT and C. B WILBUR, Bishop Clarkson Memorial Hospital, Omaha

*Narcosynthesis Use of Drugs as an Aid in Psychotherapy* Motion picture demonstrating a psychiatric technic which consists in injecting ultra-short acting barbiturates to the point of very light narcosis Patients under the influence of these drugs reproduce and reexperience emotions which are associated with psychic trauma and are more amenable to suggestion. Silent, 20 minutes

S PHILIP GOODHART and BENJAMIN HARRIS BALSER, New York

*Psychoneuroses* Motion picture showing relationship of organic and psychogenic conditions Silent, 10 minutes

*Dystonia Musculorum Deformans* Motion picture showing apparent transition from functional to organic disease Silent, 10 minutes

*Neuro-Ophthalmologic Conditions* Motion picture showing ocular manifestations with pathologic changes in the nervous system Silent, 10 minutes

### Motion Pictures on Orthopedic Surgery

BECKETT HOWORTH, New York

*Dynamic Posture* Motion picture showing that posture is more than the static standing and sitting positions The picture shows the basic dynamic posture and its relationship to the various positions and activities, including studies of the transitions between the positions in walking, running, jumping, dancing, climbing, including steps, and so on with examples of poor and of good dynamic posture. A new concept of posture presenting material not previously presented to a medical audience. Silent, 30 minutes

LAURENCE JONES, Beverly Hills, Calif

*Complete Rupture of Supraspinatus* Motion picture demonstrating basic anatomy of the capsule of the shoulder joint and its relationship to the capsular or 'short rotator" muscles Demonstration of relation between the various structures about the shoulder joint, with diagrammatic representation of supraspinatus rupture and its various sequelae (subdeltoid bursitis and other conditions) Cadaver and actual operative demonstration of simplified surgical reconstructive procedure using a fascial suture. Silent, color, 20 minutes

DONALD T IMRIE and GUY A. CALDWELL, Ochsner Clinic, New Orleans

*Analysis of Muscle Function in Poliomyelitis* (For description see Motion Pictures on Infantile Paralysis)

NICHOLAS S RANSOHOFF, Monmouth Memorial Hospital, Long Branch, N J

*Curare (Intocostrin) in the Treatment of Acute Anterior Poliomyelitis*
(For description, see Motion Pictures on Infantile Paralysis)

### Motion Pictures on Urology

FREDERIC E B FOLEY, St. Paul

*An Artificial Sphincter A New Operation and Device for Control of Urinary Incontinence* Motion picture showing cutaneous tunnel operation, design and construction of the artificial sphincter (pneumatic incontinence clamp) and inflating device for the pneumatic incontinence clamp demonstration of incontinent patients use of the artificial sphincter Silent, 20 minutes

ROGER W BARNES and R. THEODORE BERGMAN, College of Medical Evangelists, Los Angeles

*Surgical Treatment of Vesical Diverticula* Motion picture of preoperative cystogram of large vesical diverticulum which does not drain Operative technic for removal of large vesical diverticula, indicating how the mucosa of the diverticulum only is removed through a wide exposure of the interior of the diverticulum The entire diverticular sac is not removed This greatly simplifies the procedure and reduces shock, infection and operative risk. Silent, color, 12 minutes

### Motion Pictures on Gastro-Enterology and Proctology

LEO L HARDT FREDERICK STEIGMANN, MORRIS WEISSMAN and ERNEST C OLSON, Loyola University School of Medicine, Municipal Tuberculosis Sanitarium, Cook County Hospital, Illinois Central Hospital and Henrotin Hospital, Chicago

*Gastroscopic Studies in the Diagnosis and Treatment of Gastric Diseases* Motion picture of a typical gastroscopy clinic, showing technic and passing the gastroscope, also pictures as seen through the gastroscope. Silent, color, 20 minutes

ASHER WINKELSTEIN, FRANKLIN HOLLANDER, JOSEPH BANDES and ALBERT CORNELL, Mount Sinai Hospital, New York

*Intragastric Drip Therapy for Peptic Ulcer* Motion picture showing the modern physiologic interpretation of ulcer therapy and describing in detail the technic and results of intragastric drip therapy Sound, color, 40 minutes

### Motion Pictures on Anesthesiology

RALPH T KNIGHT, University of Minnesota, Minneapolis

*The Use of Curare in Anesthesia with Cyclopropane* Motion picture showing the effects of the administration of curare on 4 patients a patient without operation showing the effect of relaxation of the abdominal musculature and of the muscles of respiration, a gynecologic case showing opening of the abdomen, a resection of the colon and a gallbladder operation Silent, color, 30 minutes

PHYLLIS HARROUN and FREDERICK E BECKERT, University of California Hospital, San Francisco

*The Use of Curare with Nitrous Oxide Anesthesia for Thoracic Surgery* Motion picture showing the progress of an intrathoracic operation under nitrous oxide anesthesia with curare It includes the equipment used for this type of anesthesia, the patient properly medicated, induction, administration of curare, intubation and the setup for maintenance Record of pulse, blood pressure and respiration during anesthesia and electrocardiograms before and after administration of curare are shown Silent, color, 39 minutes

### Motion Pictures—United States Army

*Removal of Magnetic Foreign Bodies from the Eye*
*Trench Foot*
*Neurosurgery in an Overseas General Hospital*
*Convalescent Care and Rehabilitation of Patients with Spinal Cord Injuries*
*Thoracic Surgery Part I Hemothorax, with a Consideration of Specific Remedial Breathing Exercises*
*Thoracic Surgery Part II Foreign Bodies in the Lung and Mediastinum*
*Thoracic Surgery Part III Foreign Bodies in the Pericardium and Heart*
*Meet McGonegal*
*Anterior Acrylic Bridgework*
*Dental Health*
*Demonstration of the Effects of the Invisible Force Which Can Prevent Man's Escape from Spinning Aircraft*
*Construction and Use of Provisional Prostheses Part I Upper Extremity Part II Lower Extremity*
*Half a Chance (Athletic Capabilities of an Amputee)*
*Diary of a Sergeant*
*The Evacuation Hospital*
*Medical Service in the Invasion of Normandy*
*The Human Centrifuge*
*Explosive Decompression*
*The Hospital Train*
*The General Hospital*
*The Army Nurse*
*Schistosomiasis*
*Let There Be Light* (NP)
*Strictly Personal* (WAC)
*Control of Louse-Borne Diseases*
*Easy to Get*
*Ward Care of Psychotic Patients*
*Personal Health in The Jungle*
*Figures Don't Lie (WAC)*
*Pick Up*
*DDT—Weapon Against Disease*
*Avon Farms Program or Amputation of the Lower Extremities*
*Development of the Human Pick-Up*
*G Facts*
*Medical Service in the Jungle*
*Personal Health in the Jungle*
*Explosive Decompression*

### Motion Pictures—United States Navy

*Hemolytic Streptococcus Control* Motion picture stressing the need for more careful diagnosis of streptococcus cases in sick bay and use of better control measures in barracks and dispensaries, especially during epidemics Sound, 12 minutes.

*Tsutsugamushi—Prevention* Motion picture describing the work of the Medical Department in combating scrub typhus It explains methods for impregnation of clothing, clearing of camp sites, use of repellents and other preventive measures. Sound, 46 minutes

*Eye Surgery—Removal of Intraocular Foreign Bodies* Motion picture giving complete technical details for locating and removing both metallic and nonmagnetic bodies from the eye Sound, color, 15 minutes

*Eye Surgery—Field Management of Eye Injuries* Motion picture demonstrating the removal of pterygium using local anesthesia, the removal of chalazions, the treatment of wounds lacerating the cornea or penetrating it, the removal of intra ocular foreign bodies and enucleation of a badly injured eye. Sound, color, 20 minutes

*Early Care of Plastic Surgical Cases* (a) *Wounds of the Hand* Sound, color, 20 minutes (b) *Wounds of the Face and Jaw* Sound, color, 20 minutes Two motion pictures illustrating the basic theme that good end results of plastic surgery must be based on the proper handling of plastic surgical cases in the combat zones Surgical work on casualties during the battle for Germany provide realistic examples

*Plastic Surgery of the Hand* Motion picture illustrating the basic principles of traumatic surgery of the hand and the complexities of elective surgery in hand construction. The restoration of function is underlined as the primary goal Sound, color, 20 minutes

*Plastic and Reconstruction Surgery of the Hand* Motion picture showing early traumatic wounds of the hands, methods of elective surgery of the hands and, finally, cases showing late reconstructive hand surgery Basic rules and principles for hand surgery are demonstrated. Sound, color, 35 minutes.

*Plague Control* Motion picture presenting the chief clinical types of plague, the type of environment in which plague tends to flourish and rat control measures Methods for combating the spread of plague both in rats and in man are emphasized. Sound, color, 25 minutes

### Motion Pictures on Infantile Paralysis

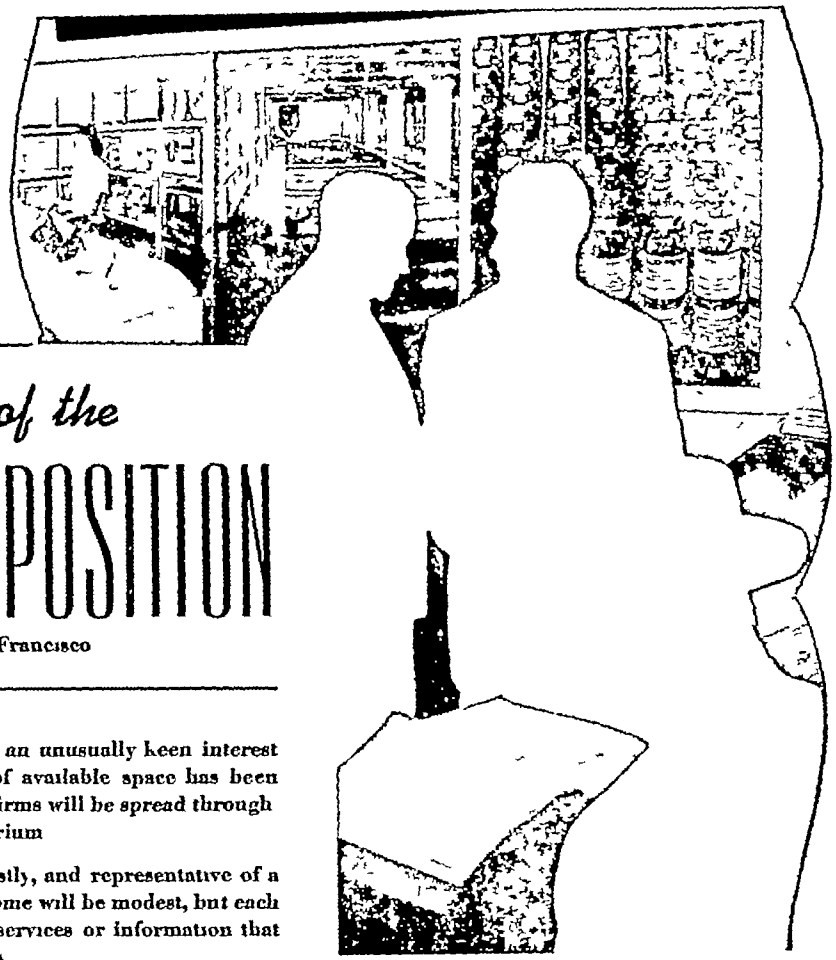
NATIONAL FOUNDATION FOR INFANTILE PARALYSIS, New York

*Physical Testing* 25 minutes

*Muscle Testing* 10 minutes

*Electromyographic and Ergographic Studies on Muscle Action* 10 minutes

*Treatment of Infantile Paralysis* 20 minutes



DONALD T IMRIE and GUY A. CALDWELL, Ochsner Clinic, New Orleans

*Analysis of Muscle Function in Poliomyelitis* Motion picture showing a case of severe paralysis The muscle function test is demonstrated The patient's gait is analyzed and correlated with the pattern of paralysis Crutches and braces are used and again the gait is studied Silent, color, 25 minutes

NICHOLAS S RANSOHOFF, Monmouth Memorial Hospital, Long Branch, N J

*Curare (Intocostrin) in the Treatment of Acute Anterior Poliomyelitis*

Motion picture showing the progress of the disease in the 25 cases of acute anterior poliomyelitis Method of giving Intocostrin, myographic studies showing spasm in acute anterior poliomyelitis and its control, and the physical therapy technics used in the treatment with the end results are included Sound, color, 40 minutes

# *Highlights of the* TECHNICAL EXPOSITION

Civic Auditorium, San Francisco

This year, manufacturers have shown an unusually keen interest in the Technical Exposition Every bit of available space has been taken and the exhibits of more than 200 firms will be spread through out three floors of the great Civic Auditorium

Some of the exhibits will be large, costly, and representative of a vast amount of work and investigation, some will be modest, but each and every one will feature products or services or information that has a live interest for the profession today

To indicate the vast amount of information available to the visiting physician, it may be pointed out that, from the pharmaceutical industry alone, more than 50 manufacturers will bring exhibits of important products. Leading manufacturers of apparatus, instruments, and x ray machines will have big showings of new and standard items Special dietary products and infant feeding materials will be presented in the light of today's knowledge. And publishers will make it possible for you to see at first hand almost any or all books of interest.

Plan to visit the exhibits, not merely one day, but every day In the Exposition Hall will be found general registration, alumni registration, post office, information bureau, lounge, transportation desk and other convenient services, adjacent (in the west end of the auditorium, 1st and 2nd floors), are the Scientific Exhibits.

Following are brief, advance notices which tell what to expect when visiting the Technical Exposition The Exposition will run from Monday, July 1 to noon Friday, July 5, daily hours, from 8.30 A.M to 6·00 P M

THOS R GARDINER

- *Surgical Supplies*
- *Toilet Preparations*
- *X-Ray and Radium*
- *Miscellaneous*

## *Apparatus and Instruments*

### ADEL PRECISION PRODUCTS CORPORATION

The Adel Clinical Color Camera and Surgiscope are solutions to the problems of taking proper color photos of clinical and operative techniques. The Adel Camera with the surgiscope provides sterile method for taking a series of precise color reproductions of the surgical field See the exhibit in booth 2

### A S ALOE COMPANY

In booth H-17 will be shown a representative cross section of a complete line of surgical instruments equipment and supplies Featured will be Aloe STEELINE treatment room equipment In addition, a wide selection of American made chrome and stainless steel instruments will be on display so that the surgeon may "browse" among them at his leisure

### AMERICAN CYSTOSCOPE MAKERS INC

The American Cystoscope Makers Inc exhibit will feature a complete line of electrically lighted telescopic diagnostic and operative instruments such as Cystoscopes Resectoscopes, Thoracoscopes Buddock Peritoneoscopes Decker Culdoscopes, as well as electro-surgical and electromedical equipment A special display will feature A.C.M.I woven and rubber catheters and the 1946 model A C M I diagnostic set Visit booth LL-24

### AMERICAN STERILIZER COMPANY

An entirely new model of the MacEachern Obstetrical Table will be featured at booth G 1 Demonstrations with a live model on this new Obstetrical Table the American Operating Table Model 1075 and the Albee-Comper Fracture Table will clearly show all that can be accomplished on this superior line of surgical equipment. Your attendance is cordially invited

*(Continued on next page)*

### C R BARD INC

If you ever have occasion to use Catheters of any description you cannot afford to miss the Bard exhibit at booth LL-7 It demonstrates that American manufacturers have succeeded in producing urological instruments superior to those made abroad The exhibit displays a complete line of woven Catheters manufactured in this country including new types designed for continuous caudal and spinal analgesia

### BARNETT OPTICAL LABORATORIES

The new Copeland Super-Viewer designed to accept photo-transparencies in sizes ranging from the standard 2" x 2" to 3¼" x 4¼" will be on display in booth H-26 This viewer will be of special interest to biological photographers who specialize in the standard lantern slide—size 3¼" x 4"

### BAUSCH AND LOMB OPTICAL COMPANY

The Bausch and Lomb exhibit will include, among other things modern diagnostic instruments, the Poiser Slit Lamp and the Ortho-Lite operating lamp Also information about the Bausch and Lomb Industrial Vision Service which includes every facility for determining the visual performance of employees Visit booth 12

### BECTON DICKINSON & CO

Featured in Becton Dickinson s booths H-5 and H-7 will be the complete line of Vacutainer equipment Representatives will demonstrate this new method of taking blood specimens for all purposes With the regular line of hypodermic equipment will be shown recently developed outfits for administering continuous caudal and continuous spinal anesthesia

### THE CALIFORNIA DARLINGTON COMPANY

The new electrically operated Beem *Hospital Bed is equipped with a standard* flush toilet lavatory with hot and cold water and drain retractable trapeze lights and many other functions all of which are concealed Stop and see it in booth I-22 \

### CAMERON SURGICAL SPECIALTY COMPANY

See the new Cameron Electro-Surgical Units, Coagulair-Sigmoidoscope Electro-Diagnostosets Flexible Gastroscopes, Bronchoscopes - Esophagoscopes - Laryngoscopes, Mirrolite, Binocular Spectacle Loupe Magniscope and other specialties developed for your postwar diagnosis, treatment and *surgery in booth H-13 All products avail*able for prompt delivery

### WILMOT CASTLE COMPANY

Most all of the Sterilizers and Operating Lights which the Castle Company is now *manufacturing will be on exhibit in their* 30 foot space booths A-26 and A 28 Equipment which will interest both the practitioner for his office and for the surgeon and specialist for institutional work will be displayed

### WARREN E COLLINS INC

You are cordially invited to visit booth I-38 where the first postwar showing of respiration apparatus will be on display The exhibit features the Drinker-Collins Respirator the Collins Oxyflo Oxygen Tent, the Drinker-Collins Infant Respirator the Benedict-Roth Water Metabolism Apparatus and the Collins Vitalometer

### CONTINENTAL HOSPITAL SERVICE

This exhibit will feature the Continental-air iceless oxygen tent with automatic temperature control, indicated for individual air-conditioning for bedside as an air therapy chamber for the removal of airborne irritants Visit booth LL-11 on the lower level

### THE DEVILBISS COMPANY

Modern instruments for spray application *oral inhalation, powder insufflation,* local application and steam inhalation will be on display at booth D-7 Representatives will welcome the opportunity to demonstrate and explain the outstanding features of the DeVilbiss line

### E & J MANUFACTURING COMPANY

The E & J Manufacturing Company will exhibit the latest developments in the F & J Resuscitator Inhalator and Aspirator You are cordially invited to witness interesting demonstrations of resuscitation by both mask and intratracheal catheter in booth I-9

### J H EMERSON COMPANY

In booth I-19 will be shown the latest models of the Emerson Resuscitator, including units for use by small hospitals and physicians the Emerson Respirator with late features including two attachments for carrying on breathing while the respirator is open for hot pack application or other physical therapy the Hot Pack Apparatus which heats moistens and wrings them out in two minutes

### THE FOREGGER COMPANY INC

The Foregger Company booth 10 will exhibit some new developments in Endotracheal equipment including a new type interchangeable folding Laryngoscope Bronchoscope-Catheter with Light and Oxygen Tube for open-chest surgery A new development in Anesthesia Apparatus containing some unique features will be shown as well

### HANOVIA CHEMICAL & MFG CO

This exhibit will feature self-lighting type Ultraviolet Quartz Lamps for orificial and general body irradiation Safe-T-Aire Quartz Lamps for the destruction of air-borne bacteria will also be displayed Ask for details about this new source of application Competent and courteous representatives will be in booth C-13 to demonstrate and explain these items

### ILLE ELECTRIC CORPORATION

The demonstration in booth C-30 will show how the care of infantile-paralysis arthritis and other disabling conditions can be greatly improved by hydromassage subaqua therapy tanks An improved 'Mobile Whirlpool Bath Mobile Sitz Bath Chair, Paraffin Bath and Folding Thermostatic Bed Tent will also be displayed

### KEYSTONE VIEW COMPANY

The exhibit at booth 4 will show latest technics in visual training Of a special interest will be the new Colordepth Trainer giving stereoprojection with the *Keystone Overhead Projector and a standard* screen New innovations in home training material will also be on display

### KIDDE MANUFACTURNIG CO INC

The Kidde exhibit in booth C-22 consists *of the plastic $CO_2$ Snow Maker plastic* applicators for applying the Snow and $CO_2$ Refill Cartridges for the Apparatus The Kidde Dry Ice Apparatus makes cryotherapy safe simple and easy to apply thus eliminating former objections to the use of this long recognized therapy

### THE LIEBEL FLARSHEIM COMPANY

It will be a privilege for the Liebel Flarsheim Company to exhibit their latest model BOVIE electrosurgical units and short wave diathermies The company and its representatives cordially invite you to visit booth H-15 for examination and demonstration of the latest developments in electrosurgical and diathermy apparatus

### THE LINDE AIR PRODUCTS COMPANY

The LINDE oxygen USP and LINDE oxygen therapy regulating equipment will be presented at booth G-9 Aspects of oxygen therapy of special interest to physicians will be a feature of the exhibit. The LINDE R-50 all-purpose oxygen therapy *regulator and the LINDE L-14 float type* flowmeter will be displayed

### MACALASTER BICKNELL COMPANY

This exhibit in booth LL-2o will feature the Fenwal System for the simplified prep*aration, storage and administration of* parenteral fluids reusable equipment for whole blood collection processing to plasma storage and administration a unique consolidated Tube and Needle Set featuring a single vent tube and expendable tubing. Your inspection is cordially invited

### THE MAICO COMPANY INC

The Maico Company will feature a new inverted tonal emphasis the Stethetron permitting selective amplification of body sounds Operating on a principle of inverted tonal emphasis the Stetheton permits emphasis of particular sounds while subduing extraneous sounds to convenient levels of comparison See it in booth F 26

### V MUELLER & COMPANY

The remarkable new Eder Gastroscopes both the Flexible and the Flexi Rigid models will have a prominent place in the V Mueller & Company exhibit in booth G-14 You are invited to examine these *greatly improved diagnostic instruments* The display will also include a large selection of new developments in instruments for special surgery of all types

### ORTHOPEDIC FRAME COMPANY

*The Stryker Cast Cutter will be demon*strated in booth LL-3 This electric saw does not rotate but oscillates thus cutting the cast which is rigid but not the padding and skin beneath which gives with the oscillations The Stryker Turning Frames now available for civilian use will also be demonstrated

### THE PELTON & CRANE COMPANY

You are invited to visit display booth C-19 At this showing Pelton offers no *startling innovations as all available* facilities and materials are being devoted to one end—a desperate effort to meet your overwhelming demands for our already established items of professional equipment

### THE PROMETHEUS ELECTRIC CORP

New developments in Food Conveyors Tray Trucks Sterilizers and Operating Lights are featured at the Prometheus Electric Corporation exhibit in booth E 9 *Materials such as stainless steel bronze* and live rubber which have long been unobtainable for use in this type of equipment make a welcome *reappearance*

### THE PYRAMID RUBBER COMPANY

See the Modern Evenflo Nursers in booth C 18 which embody one of the most important improvements in nursing equipment in years Their valve action nipple enables normal and subnormal babies to nurse better and get more benefit from their food And the modern self-contained Evenflo with its nipple bottle cap all-in-one unit sanitarily seals both the formula and the nipple

### RITTER COMPANY INC

On exhibition in booths 7 and 9 are the Ritter shockproof x-ray Ritter compress with instruments Ritter Motor Chair the Ritter Shockproof x-ray Ritter compressor Ritter Rest and Relief Stool Ritter Mobilrest Stool Ritter Fluorescent Light Ritter Sterilizer and Ritter Bone Surgery Engine

### SAFETY GAS MACHINE CO INC

In booth F-36 the Safety Gas Machine Co Inc is showing for the first time their new Cabinet Gas Apparatus which has some novel features They will also display their well known Augustana Models Representatives invite you to discuss your anaesthetic problems with them

### SHAMPAINE COMPANY

The Shampaine Company manufacturers of physicians and hospitals surgical furniture will feature their Steelux Examining and Treatment Tables Steelux Instrument Cabinets the well known Martin All-Purpose Hydraulic Chair-Table as well as the celebrated Perfection Major Operating Table in booth F-16 Factory representatives qualified to discuss all equipment problems will be on hand

### J SKLAR MANUFACTURING COMPANY

The exhibit in booth C 5 will feature an extensive display of American made stainless steel surgical instruments with particular emphasis given to various interesting special instruments produced exclusively by Sklar Hospital models of suction and pressure apparatus will also be shown

### C M SORENSEN CO., INC

The latest models of Ear Nose and Throat Equipment (treatment as well as surgical units) will be displayed in booth H 34 The DeLuxe will be furnished with coagulator and cutting current. Operating-room equipment has explosion-proof features Also on display will be the recently acquired Syfogen Naso-Therapy Units

### TAYLOR INSTRUMENT COMPANIES

See the animated Jumbo Tycos in booth H-12 which shows the internal construction of this blood pressure instrument and tells you why the Tycos remains accurate after years of continuous service Try out the popular Tycos hook type cuff on the model arm display to convince yourself how much faster and easier it is to use

### THE TECHNICON COMPANY

The Autotechnicon and Scopicon will be featured in booth F-23 The Autotechnicon is a machine for the automatic processing and staining of tissues The Scopicon is a microslide and transparency projector of uncommon versatility and efficiency Also on display will be a new cardiograph

## Diagnostic Equipment

### W A BAUM COMPANY INC

The finest Baumanometers ever made are now available in all their pre-war perfection All of the well-known models of the Lifetime Baumanometer will be on display A cordial invitation is extended to all doctors in attendance to inspect these master intruments at booth C-15

### BECK LEE CORPORATION

Keynoting fundamental accuracy in cardiac diagnosis the Beck-Lee Electrocardiograph exhibit will dramatize the essential criteria by which these scientific instruments must be judged Fundamental requirements including the quartz-string Einthoven galvanometer and independent timing by light will be graphically demonstrated at booth F-9

### CAMBRIDGE INSTRUMENT COMPANY INC

At booth A-13 will be exhibited the Cambridge Simplitrol Portable Electrocardiograph Cambridge Simplitrol Portable Electrocardiograph - Stethograph - Pulse Recorder also the Cambridge Plethysmograph which pneumatically records graphically the varying size of an extremity as determined by the state of fulness of its blood vessels

### THE MALTINE COMPANY

Thromboplastin Maltine the newest product to be released from the research laboratories of The Maltine Company will be displayed in booth A-11 Thromboplastin-Maltine was developed for use in clinical laboratories to determine the prothrombin clotting time of blood Prepared for diagnostic use only it is more potent and stable than thromboplastins formerly available

### SANBORN COMPANY

A complete demonstration of the new Sanborn "direct-writing electrocardiograph the Viso-Cardiette will be provided for visitors at booth E-2 You may experience the simplicity of this instrument s operation You will see the recording of the heart impulse on the instant it occurs and will be able to take with you the finished and permanent cardiogram

## Dietetic Products

### AMERICAN CAN COMPANY

You are cordially invited to visit the American Can Company s exhibit in booth F-11 where information will be available concerning those aspects of commercially canned foods which are of particular interest to the Medical Profession The American Can Company s new composite fibre-metal can for frozen foods will be featured in this exhibit.

### AMERICAN SEAL KAP CORPORATION

Booth H-9 will have a display explaining Enzylac a milk of low curd tension its methods of production and dietary significance

### THE BAKER LABORATORIES

Representatives will be in attendance in booth E-12 to welcome you and to discuss with you the merit of Baker s Modified Milk and Melodex The former is a completely prepared milk formula while Melodex (maltose and dextrin) is a low-cost carbohydrate in dry form made especially for use in the preparation of evaporated and fresh milk formulas

### THE BEST FOODS INC

In booth F-15 The Best Foods Inc will exhibit Nucoa the wholesome nutritious vegetable margarine which contains 15 000 units of Vitamin A to the pound Also on exhibit will be the famous Best Foods and Hellmann s Real Mayonnaise Representatives will welcome questions about the products

### CARNATION COMPANY

Be sure to visit the Carnation Company booth I-19 where you will see an attractive display presenting some interesting information on the various uses of Carnation Vitamin D Evaporated Milk for infant feeding child feeding and general diet purposes The method by which Carnation Milk is generously fortified with Vitamin D—400 U S P Units per reconstituted quart—will be explained Valuable literature will also be available for distribution

### CEREAL INSTITUTE INC

In booth H-25 the Cereal Institute Inc will present three factual topics of timely interest (1) An evaluation of cereal proteins in the national dietary demonstrating the importance of the grains as protein sources (2) The nutritional composition of breakfast cereals (3) A basic breakfast pattern as a step toward re-educating the public to the eating of an adequate morning meal

### THE DIETENE COMPANY

Completely new diets for use with Dietene s Accessory Feeding and Dietene Reducing Supplement will be on display in Booth G-16 These new diets are up to-date from a nutritional standpoint and are arranged to make it simple for patients to follow their diet with the least amount of special food preparation

### EVAPORATED MILK ASSOCIATION

You are cordially invited to register for a free copy of the new manual for physicians on the use of evaporated milk in infant feeding This booklet includes discussions of the significance of vitamin D fortification in pediatrics construction of infant feeding formulas feeding of newborns and of infants under special conditions supplementary foods complementary feedings and other phases of infant feeding Other material on the dietary uses of evaporated milk is available in booth C-10

### GENERAL FOODS CORPORATION

At long last Sanka the famous decaffeinated coffee is being introduced in instant form Not yet marketed Instant Sanka will be previewed at the A M A Convention You are cordially invited to be one of the first to try it. Just step over to Booth C-35 and enjoy a cup of delicious Instant Sanka the coffee that lets you sleep

### GERBER PRODUCTS COMPANY

You are cordially invited to visit the Gerber Baby exhibit This will include two ready-to-serve highly nutritious baby cereals a wide variety of Strained Foods for the infant Chopped Junior Foods for the toddler and Gerber s professionally

### SCHENLEY LABORATORIES INC

This exhibit will be devoted entirely to penicillin and penicillin products and features clinical illustrations of treated patients The complete apparatus for penicillin aerosol treatment of respiratory infections by inhalation will be demonstrated to interested physicians by well informed attendants in booth A-1 Descriptive literature concerning this treatment method and various Schenley Laboratories products will be supplied on request

### SCHERING CORPORATION

The Schering exhibit will feature Estinyl (Ethinyl estradiol) one of the most potent oral estrogens Priodax, a new oral cholecystographic aid for better gallbladder visualization and Neo-Iopax a safe urographic medium for clear detailed visualization in pyelography Members of the Schering professional service division will be in booth 8 to answer any pertinent inquiry

### G D SEARLE & COMPANY

You are cordially invited to visit the Searle booths G 5 and G-7 representatives will be happy to answer questions pertaining to Searle Products of Research Featured will be Searle Aminophyllin Metamucil and Diodoquin

### SHARP & DOHME

You are cordially invited to visit the Sharp and Dohme booths D-2 and D-4 This year's display will feature Lyovac Normal Human Plasma Sulfasuxidine, Delvinal Sodium, Ivyol Poison Ivy Extract Sulfamerazine Tyrothricin Concentrate and a complete line of immunization biologicals Capable informed representatives will be present at all times

### THE SMITH DORSEY COMPANY

This exhibit will feature a large photograph of the new research and manufacturing laboratory now being constructed The latest developments in estrogen therapy will be one of the principal parts of the display and liver therapy will be discussed by representatives at booth G-13

### SMITH KLINE & FRENCH LABORATORIES

Benzedrine Inhaler, N.N.R., Benzedrine Sulfate Tablets and Elixir N.N.R., and Pentnucleotide, N.N.R. are featured at this exhibit in booth D-9 Specially trained professional representatives will answer questions concerning the uses of these products in your practice

### E R SQUIBB & COMPANY

A portable exhibit on "Therapy with Penicillin" will be presented in booths C-2 and C-4 This exhibit shows in photographs and cartoons with descriptive captions an outline of the underlying principles of penicillin therapy Designed for the guidance of the busy physician and for use in medical schools Twenty panels each forty inches long with removable aluminum standards can be set up anywhere available on loan

### FREDERICK STEARNS & COMPANY

You are cordially invited to visit the exhibit of Frederick Stearns & Company Division in booth H-4 Neo-Synephrine Hydrochloride products for intranasal parenteral and ophthalmic use will be featured Parenamine (Amino Acids Stearns)—a complete mixture of amino acids derived from the acid hydrolysate of casein fortified with pure dl-tryptophane to the extent of 1% of the total amino acids A professional staff will be in attendance to discuss these products with you

### VARICK PHARMACAL COMPANY INC

The theme of this exhibit will be the use of DIGITALINE NATIVELLE the original digitoxin in single dose oral digitalization The panel in booth F-30, will portray graphically by means of a clock-like figure the 3 to 6 hours required for digitalization A miniature showcase will contain specimens of the product

### WILLIAM R WARNER & COMPANY

The comparative action of various chemotherapeutic agents (penicillin tyrothricin sulfonamides and the methylene dyes) on local infections in animals will be included in the exhibit in booth F-14

### THE WARREN TEED PRODUCTS COMPANY

Council accepted products will be on display in booth A-18 The entire display will be illuminated by indirect lighting Two of the units will contain translite pictures of scenes in the Warren-Teed laboratories and manufacturing departments

### WHITE LABORATORIES INC

An entirely new exhibit displaying White's Cod Liver Oil Concentrate products and other Council-Accepted vitamins, will be shown in booths H-1 and H-3 White Laboratories will display clinical material depicting interesting facts in vitamin research The exhibit is in charge of representatives who will endeavor to serve you in every way possible

### WINTHROP CHEMICAL COMPANY INC

You are cordially invited to visit the exhibit of Winthrop Chemical Company Inc in booths D 6, D-8, D-10 and D-12 where colored models showing the causative agents of all the principal tropical diseases will be on display Your attention is particularly invited to that portion of the exhibit devoted to malaria where all forms of the malaria parasite including the exoerythrocytic will be shown

### WISCONSIN ALUMNI RESEARCH FOUNDATION

This exhibit in booth H-22 will be of a graphic scientific nature showing effects of different substances on blood clotting time Of interest too will be the showing of methods for assay of Vitamin D and other vitamins

### WYETH INC

Visit booth D-14 and get acquainted with a few of the new outstanding additions to the line of Wyeth Pharmaceutical Biological and Nutritional products

## Special Apparel

### S H CAMP & COMPANY

A series of illuminated transparencies, depicting various anatomical conditions before and after application of Camp Scientific Supports will be displayed The complete line of merchandise for prenatal postnatal visceroptosis sacroiliac hernia and other specific conditions will be shown Experts from the Camp staff will be in attendance to answer questions in booth E-13

### THE CONFORMAL SHOE COMPANY

The exhibit display will illustrate how the Conformal shoe achieves snug custom fit and balanced support for each individual foot with its special patented plastic insole Visit booth F-34

### MRS DAY'S IDEAL BABY SHOES

Doctors are cordially invited to booth F-7 to inspect Mrs Day's Ideal Baby Shoes and to discuss their problems in this field A representative display of new Ideal Baby Shoes in the crib soft intermediate and walking shoes covering the four stages of Babyhood will be exhibited

### J EDWARDS AND COMPANY

A very interesting exhibit of children's shoes for all age groups will be displayed in booth LL-5 in the lower level These shoes are the production of J Edwards & Co manufacturers of childrens shoes since 1900 and feature regular as well as corrective type shoes from tots to teen age children

### SPENCER INCORPORATED

The standard AAF G-Suit will be on display in booth E-4—successfully used in combat to minimize pilot blackout—developed by Spencer designers cooperating with Army Navy and scientific agencies Also to be displayed Spencer individually designed supports for spinal conditions visceroptosis and nephroptosis with symptoms antepartum postpartum and postoperative needs inoperable hernia and breast conditions

### THE VANTA COMPANY

VANTA garments for infants offer layette items without pins or buttons and for toddlers, Self-Help garments all of which will be exhibited in booth LL-21 Originator of the Tie Vest Sun Suit K-band Baby Bess hose and other important features, Vanta will show No-Fas-ning shirts and the latest advancements in proper clothing

## Surgical Supplies

### AMERICAN SAFETY RAZOR COMPANY

ASR Sanitary Bed Pan Covers are made of paper easily disposable, guarantee improved sanitary technique See this new item at booth LL-15 Also on view will be ASR Surgeon's Blades and Handles made by craftsmen who are lifelong specialists in the art of edge making

### BAUER & BLACK

Booth C-44 features Curity Hospital Dressings and Curity Sutures New Ostic Bandages and Splints developed to give prompt, controlled setting anatomical molding greater initial and final strength save professional time An outstanding feature of Curity Suture Laboratories is free medical literature extract service with complete bibliography taken from past five years literature on variable conditions of surgical patient

# MEDICINE AND THE WAR

## ARMY

### NUMBER OF MEDICAL OFFICERS RELEASED

The Office of the Surgeon General recently stated that, up to May 1, 1946, 32,100 medical officers and 41,700 nurses had been released from service

### BRIGADIER GENERAL SIMMONS HONORED

The honorary degree of Doctor of Science was conferred on Brig Gen James S Simmons U S Army, chief of the preventive medicine service Office of the Surgeon General and dean-elect of the Harvard School of Public Health, on April 13 at the sesquicentennial commemoration of the founding of the University of North Carolina

### STUDY PREVENTIVE MEASURE FOR RESPIRATORY DISEASES

Experiments are being conducted by the Army Medical Department in treating GI blankets with a light oil solution in an attempt to offset the prevalence of respiratory diseases

In selected barracks at Fort Belvoir, Virginia, and Aberdeen Proving Ground, Maryland, the preventive measure is being tested now Previous experiments were made in Camp Carson, Colorado and Fort Bragg North Carolina, from 1943 to 1945, under the direction of the Army Epidemiological Board

The treatment calls for the spreading on the barracks floors of a light oil which has a paraffin base. The liquid resembles cylinder oil and is odorless and colorless It spreads evenly and is readily absorbed The theory behind the treatment is that the oil will trap dust and other respiratory germs by absorbing them Once a soldier coughs the expelled germs will settle on his blanket or on the floor and be anchored instead of drifting about the room to infect others

### ARMY AWARDS AND COMMENDATIONS

#### Colonel Arthur S W Touroff

Col Arthur S W Touroff, New York, was recently awarded the Legion of Merit 'for exceptionally meritorious conduct in the performance of outstanding services as thoracic consultant to the 12th (U S) Hospital Center and thoracic surgeon in charge of the thoracic surgery section, 155th General Hospital from June 6, 1944 to June 7, 1945 Colonel Touroff's outstanding skill, untiring effort and devotion to duty resulted in the saving of many lives, the prevention of permanent disability in many cases and the shortening of the period of incapacity among the wounded. His judgment and skill far beyond the average, resulted in the rendering of highly superior treatment to the many hundreds of battle casualties coming under his care. Colonel Touroff made an outstanding contribution to the successful Allied operations and served to reflect great credit on himself and the United States Army" Dr Touroff graduated from Columbia University College of Physicians and Surgeons, New York, in 1925 and entered the service Sept. 23 1942

## VETERANS

Work will start immediately on plans and specifications for eight hospitals for the Veterans Administration, which were recently completed. A survey for a new 1 000 bed hospital at Albany N Y, was also started and for additions or conversions at five other hospitals The location size, type and estimated cost of the eight hospitals for which plans are authorized are

Iron Mountain, Mich., 250 bed general medical $2,555 037, Seattle, 300 bed general medical, $3 351,216, Wilkes-Barre, Pa., 475 bed general medical, $3,703,463, Decatur Ill, 250 bed general medical $2,768 258, Shreveport, La. 450 bed general medical, $3,715 361, Big Spring, Texas 250 bed general medical $2,570 753, Miles City, Mont. 100 bed general medical, $1 052,312, Fresno, Calif., 250 bed general medical $2 634 676

Field survey for the new hospital at Albany N Y, will include making soil bearing tests and borings to determine the type of underlying structure among other engineering data. The hospital, estimated cost of which is $10,423 706, will have 800 beds for general medical patients and 200 beds for neuropsychiatric cases

The field surveys to be made on conversions and additions to established hospitals with the estimated costs of making such changes, are as follows

Montgomery, Ala. conversion of a 268 bed hospital to a tuberculosis hospital, $711,215, Tuskegee, Ala, addition to the hospital there of 164 beds for neuropsychiatric cases, $3 729 768, Columbia, S C, addition of 200 beds for general medical purposes $2,466 062 Brecksville, Ohio conversion of a 269 bed hospital and addition of 131 beds all for tuberculous patients, $1,376,193, Gulfport, Miss, conversion of a 164 bed hospital for neuropsychiatric cases, $2 003 722

All contracts for this work will be let to civilian architects, engineers and constructors through the district and division engineers in charge of territory in which the hospital is located.

### HOSPITALIZED VETERANS OFFERED U S ARMED FORCES INSTITUTE COURSES

Arrangements were recently completed to provide educational opportunities through the USAFI for personnel in veterans hospitals Some ninety odd correspondence and self-teaching courses prepared by the USAFI will be made available to hospitalized veterans in accordance with arrangements made with the Veterans Administration. The courses will be followed up by corresponding end of-course tests such as are regularly given to personnel on active duty

The Veterans Administration has planned that lessons and tests submitted will be graded by the University of Wisconsin, which now grades lessons submitted by military personnel Registration of courses, grading of lessons, administration and grading of tests and the recording of course completions for possible accreditation purposes will be the complete responsibility of the Medical Rehabilitation Service of the Veterans Administration. The Army supplies at one time bulk shipments to named veterans' hospitals

Generally, personnel in veterans' hospitals have been unable to participate in educational programs Such personnel could not enroll for services of the United States Armed Forces Institute. (USAFI services are limited to military personnel on active duty Veterans who had enrolled for courses prior to discharge may, under circumstances, complete such courses) As veterans could not take advantage of educational programs provided for them until they had been separated from the veterans' hospitals, this arrangement is limited to hospitalized veterans

### APPOINTED CONSULTANT TO VETERANS ADMINISTRATION

Dr Lewis J Moorman, Oklahoma City, was recently appointed consultant by the Veterans Administration in line with its policy to bring civilian medical consultant service into the Veterans Medical Program

# ORGANIZATION SECTION

## THE TAFT-SMITH-BALL NATIONAL HEALTH BILL

### Analysis of S 2143

*Prepared by the Bureau of Legal Medicine and Legislation, American Medical Association*

On May 3, 1946 Senator Taft, Ohio, for himself and Senator Smith, New Jersey, and Senator Ball, Minnesota, introduced S 2143, a bill to "coordinate the health functions of the federal government in a single agency, to amend the Public Health Service Act for the following purposes to expand the activities of the Public Health Service, to promote and encourage medical and dental research in the National Institute of Health and through grants-in aid to the states, to construct in the National Institute of Health a dental research institute and a neuropsychiatric institute, and for other purposes" The bill was referred to the Senate Committee on Education and Labor, before which is pending the current version of the Wagner-Murray-Dingell bill

S 2143, forty-six pages in length, contains three titles Title I would create a National Health Agency to which would be transferred designated health activities now carried on by the federal government Title II proposes amendments to the Public Health Service Act to provide for (1) general medical service for families and individuals with low income, (2) dental health services for school children and families and individuals with low income and (3) medical, dental and neuropsychiatric research The third title proposes amendments to existing laws made necessary by the bill and would permit payroll deductions from the salaries of government employees to facilitate their participation in nonprofit medical, hospital and dental care plans

#### BILL AS VIEWED BY SENATOR TAFT AND SENATOR SMITH

In introducing S 2143, Senator Taft said that it represented a completely and entirely different philosophy of approach from the plan proposing universal federal compulsory health insurance. Under that plan, Senator Taft contended,

> every person in the United States—not only those unable to pay but every one—must contribute a percentage of his payroll or otherwise to a compulsory federal fund for which he is supposed to receive medical service. That means that between $3 000 000 000 and $5 000 000 000 would pour into the federal treasury in Washington and would then be expended by a vast administrative organization in paying all the doctors in the United States The doctors would be directed as to what they could do in the way of furnishing medical service how often they could call for what kind of diseases they could call what kind of medicine they could prescribe if it were an expensive medicine and all the details of medical service In effect all the doctors in the United States would become employees of the federal government That is not only socialization of medicine but it is a complete nationalization of the medical profession

By contrast, Senator Taft described the operation of his bill as follows

> The proposal I submit would fill up the gaps in the service performed by the present system So under the existing system with its freedom of doctors and the freedom of medicine which we have enjoyed and which has made this country almost outstanding in the progress of medical science we would retain those characteristics and enable every person in the United States to receive adequate medical services
>
> Mr President the bill proposes therefore fundamental differences from the other plan First it would place the entire responsibility on the states and on the *local governments where it now rests. Instead* of federalizing the whole undertaking and turning over this tremendous field to bureaucrats in Washington it would place as I have said the responsibility under the state and local governments. In the second place it attempts to provide only for those who are unable to pay for essential medical service leaving those who are able to pay free to do as they choose with reference to obtaining medical service The bill would encourage the development of health insurance funds for persons who may wish to take advantage of such insurance and protect themselves against the future occurrence of some form of catastrophic illnesses

Senator Smith also emphasized the point of view that S 2143 puts the responsibility directly up to the states to determine their own health programs with aid from the federal government and in justification of this method of approach said

> All through our history we have profited by the fact that we had forty eight states which were in a sense, laboratories in which new programs and methods could be put into effect In carrying out the proposed program we will not be required to go to the federal government for a centralized control We will ask the states to show us the way and thereby enable all our people to be protected through a medical and health program Those who are proposing this bill wish to obtain the best health system which can be obtained for the people of this country We are thinking particularly in terms of those in the lower income brackets I submit that the method of trial and error the method of evolution in our progress in difficult and complicated subjects such as this and our desire to have wholehearted support of the medical profession represents the proper approach to a blueprint for the future.

#### NATIONAL HEALTH AGENCY

Title I of the bill would create in the executive branch of the government an independent agency to be known as the National Health Agency, to be administered by a national health administrator appointed by the President by and with the advice and consent of the Senate His salary will be $15,000 a year

*Qualifications of Administrator*—The administrator may not engage in any other business, vocation or employment. He must be a citizen and must either be a doctor of medicine with at least eight years of experience in the commissioned corps of the United States Public Health Service or a doctor of medicine licensed to practice in one or more states who has had at least five years of active practice and three years of experience in a responsible position in medical research, teaching or administration

*Purposes and Duties of Agency*—The purpose of the agency will be to promote the general welfare of the people by aiding and fostering progress in the field of health and by centralizing in the agency the activities of the federal government relating to health It will be required to (1) encourage the development throughout the nation of health services and facilities, (2) advise and cooperate with other agencies and departments of the federal government and with state governments and agencies, and with private agencies functioning in the field of health, (3) collect and analyze statistics and make studies, investigations and reports on conditions, problems and needs in the field of health in the United States and in other countries, and to disseminate and make available information in this field, (4) make reports and recommendations with respect to the most efficient policies and methods for the promotion of health and related services, including recommendations with respect to legislation and matters of administrative policy, and (5) carry out the specific duties entrusted to it by the Congress

The agency will have responsibility for governmental activities having to do with (1) the administration of funds appropriated as grants to states for medical care, dental care, hospital facilities and other health activities, (2) the prevention of disease through water purification, sewage treatment and elimination of lake and stream pollution, (3) the promotion of maternal, antepartum and child care, and the study and dissemination of information on child growth, development and nutrition, (4) the protection of health by promoting purity standard potency and truthful and informative labeling of foods, drugs and cosmetics, (5) the training and rehabilitation of persons vocationally handicapped, and (6) such related mat

ters as shall aid the states and the people in the maintenance of adequate and efficient health facilities and otherwise promoting the national health

*Transfer of Functions to Agency*—The following existing agencies and their functions powers and duties will be transferred to the National Health Agency the United States Public Health Service, St Elizabeths Hospital, the Food and Drug Administration, the Office of Vocational Rehabilitation, the functions and duties of the Children's Bureau concerned with the administration of title V, parts 1 and 2, of the Social Security Act, and the functions and duties of the Division of Health Studies in the Bureau of Research and Statistics of the Social Security Board

The director of the Bureau of the Budget will be directed to make a study of the activities of other departments and agencies of the federal government to determine whether any of their activities relating to health should be transferred to the agency The study is to be completed by June 30, 1947 and a report of its results submitted to the Congress

Nothing in the title would effect a transfer to the agency of any powers, functions or duties exercised by the Army, the Navy or the Veterans Administration

*Units of Agency*—In the agency there will be the following units (1) the Office of the administrator, (2) the Public Health Service, which in turn will assume the jurisdiction of St Elizabeths Hospital and Freedman's Hospital, (3) the Food and Drug Administration, (4) the Office of Vocational Rehabilitation, (5) the Office of Maternal and Child Health, (6) the Office of Health Statistics, and (7) such other constituent units as the administrator finds necessary

The Surgeon General of the Public Health Service will be appointed as provided in section 204 of the Public Health Service Act. The heads of other constituent units of the agency will be appointed by the administrator

*Surgeon General to Act in Absence of Administrator*—In the absence of the administrator or in case of vacancy in the office, the Surgeon General of the Public Health Service will act as administrator until that official returns to duty or until the vacancy is otherwise filled When the Surgeon General does so act, the Deputy Surgeon General will act as Surgeon General in accordance with the provisions of the Public Health Service Act.

*Advisory Council on Maternal and Child Care*—Within the Office of Maternal and Child Health there will be an Advisory Council on Maternal and Child Care to be appointed by the administrator This council will advise and consult with the head of the Office of Maternal and Child Health in the formulation and administration of the medical and technical activities of the office. It will be composed of eight members, at least three of whom must be doctors of medicine who are specialists in obstetrics or pediatrics The term of office of a member will be four years with the exception of those initially appointed, whose terms of office will be staggered. The administrator will designate one member to be chairman. Each member will receive compensation at a rate fixed by the administrator but not in excess of $25 a day and will be entitled to an allowance for necessary traveling and subsistence expenses while serving away from his place of residence

*Reports by Administrator*—The administrator will be required to submit to the Congress and to the President a report in writing annually giving an account of all moneys received and disbursed, describing the work done by the agency and making such recommendations as he may deem necessary

*Appropriations*—There will be authorized to be appropriated for the administrative expenses of the agency for each fiscal year such sums as may be necessary

*Effective Date of Title*—This title will take effect on July 1, 1946 The administrator, however, may be appointed by the President, and his appointment confirmed by the Senate, at any time after the enactment of the title, but such appointment will not become effective until the effective date of the title.

### MEDICAL SERVICES FOR LOW INCOME GROUPS

Title II of the bill would add a new title to the Public Health Service Act, title VII, to assist the states to provide general health, hospital and medical services for families and individuals with low income. An appropriation of $200,000,000 for each of five fiscal years would be authorized for making payments to states which have submitted and had approved by the Surgeon General state plans for providing these services During and after this five year period the Congress will, it is contemplated, review the program and determine the amount to be authorized thereafter

*State Plans*—Any state desiring to participate in this program may submit a plan to the Surgeon General Such a plan must

1 Designate a single state administrative agency which, after 1948, must be the state health agency

2 Provide for the designation of a state health advisory council which must include representatives of nongovernmental organizations or groups, and of state agencies concerned with health, medical or hospital services, including representatives of state medical associations, voluntary nonprofit medical and hospital associations or other groups interested in the improvement and better distribution of health and medical services

3 Contain satisfactory evidence that the state agency will have authority to carry out the plan

4 Set forth a statewide program designed and calculated to provide, within five years, hospital, surgical and medical services in hospitals, clinics or similar institutions for all families and individuals having insufficient income to pay the whole cost of such services and health inspection services for children in elementary or secondary schools A plan may also, at the option of the state, provide medical care in the home or physicians' offices for such families and individuals and may also provide for the furnishing of services by means of payment of premiums or partial premiums by the state on behalf of families and individuals unable to pay the whole cost of such insurance to any voluntary health, medical or hospital insurance fund operated not for profit. Such plan must provide for the collection of proper charges of less than the total cost of such services from persons able to pay in part. The plan may include and take account of services to be rendered by governmental subdivisions of the state and by private organizations operating not for profit and may provide for the payment to such institutions by the state or subdivision for services so rendered A plan may also include annual payments to physicians practicing in areas which, without such payments, would be unable to provide sufficient income to attract a physician A plan so submitted must be based on a statewide survey of existing medical, surgical and hospital care and must describe in detail the extension of such services to the end that they be furnished without discrimination on account of race, creed or color to all persons unable to pay in full for the services

5 Describe the financial participation required from the state and its governmental subdivisions to put the plan into effect for a five year period Such financial participation shall be at least twice the amount of federal money to be made available to the state under the legislation

6 Set forth the relative need of the various proposals contained in the plan and provide for the proper priority between such proposals

7 Provide the method of administration of the plan, including the establishment and maintenance of personnel standards on a merit basis, but the Surgeon General will have no authority with respect to the selection, tenure of office or compensation of any individual employee.

8 Provide for the making of reports by the state agency to the Surgeon General and for the accessibility of state records

9 Provide that the state agency will review its plan from time to time and submit to the Surgeon General any necessary modifications

*Approval of State Plans*—If a state plan fulfils the conditions specified in the preceding paragraphs, it must be approved by the Surgeon General If a plan is disapproved for failure to comply with the conditions named the National Health Council must on request of the state agency afford it an opportunity for hearing If the council decides that the plan does comply with the conditions, the Surgeon General must approve it.

The bill specifically prohibits the Surgeon General from disapproving any plan because he may disapprove of the *methods*

proposed, if the program is designed and calculated to provide, at the end of the five year period, hospital, surgical and medical services in hospitals, clinics or medical or similar institutions for all persons having insufficient income to pay the whole cost of such services and if it provides health inspection services for all children in elementary or secondary schools at a cost within the probable financial resources of the state with federal aid The intent is expressed in the bill that the state shall devise in each case the *methods* by which the desired end is to be attained

*Allotments to States*—Each state with an approved plan will be entitled to an allotment for each fiscal year of a sum bearing the same ratio to $200,000 000 as the product of (*a*) the population of such state and (*b*) its percentage of tax-paying ability bears to the sum of the corresponding products of all the states having approved plans The percentage of tax-paying ability of a state will be that percentage which bears the same ratio to 50 per cent as the per capita income of the continental United States, exclusive of Alaska, bears to the per capita income of the state, except that it will in no case be more than 66⅔ per cent or less than 25 per cent. Sums allotted to a state for a fiscal year and remaining unencumbered at the end of the year will remain available to the state for the next fiscal year

*Withholding of Allotments*—Allotments to states may be discontinued with the approval of the administrator if the Surgeon General, after reasonable notice and opportunity for hearing to the state agency, finds (1) that the agency is not complying substantially with the provisions of its plan, (2) that any federal funds have been diverted or (3) that the state and its governmental subdivisions have failed to provide toward the carrying out of the plan at least twice as much money as received from the federal government. A dissatisfied state whose allotments have been discontinued may appeal to the United States circuit court of appeals for the circuit in which the state is located.

*Regulations, National Health Council*—The Surgeon General is authorized to make such administrative regulations as he finds necessary and in administering the program will be required to consult with the National Health Council consisting of the Surgeon General ex officio as chairman and eight members appointed by the administrator Five of the appointed members must be persons who are outstanding in fields pertaining to health activities, at least three of whom shall be doctors of medicine. The other three appointed members must be persons familiar with the needs for medical care in urban or rural areas Each appointed member will hold office for a term of four years except the members first taking office, whose terms will be staggered Appointed members will be ineligible to serve continuously for more than two terms but may be reappointed if they have not served two consecutive terms immediately preceding reappointment. Special and technical committees may be appointed by the council Appointed council members and members of special committees will receive compensation at rates fixed by the administrator but not to exceed $25 a day plus an allowance for actual and necessary travel and subsistence expenses The council will meet as frequently as the administrator deems necessary, but not less than once each quarter If three or more members so request, the administrator will be required to call a meeting of the council

*Miscellaneous*—If the Surgeon General believes that the purposes of this title would be promoted by a conference of representatives from state health agencies, he may call such a conference as provided in the Public Health Service Act

Except as otherwise specifically provided, nothing in the title may be construed as conferring on any federal officer or employee the right to exercise any supervision or control over the administration, personnel, maintenance or operation of any health services with respect to which any federal funds are expended

### DENTAL HEALTH SERVICES

Another new title to be added to the Public Health Service Act, title *VIII*, proposes federal funds to assist the states to provide dental inspection for school children and necessary dental care for those school children and other individuals and families unable to pay the whole cost of such care. For the fiscal year ending June 30, 1947 the sum of $8,000 000 will be authorized, for the fiscal year ending June 30 1948, $12,000 000, for the fiscal year ending June 30, 1949, $16 000,000 and for the next two fiscal years the sum of $20,000,000 each.

*State Plans*—For a state to take advantage of this title, it must submit a plan to the Surgeon General for his approval The requirements with respect to such a plan parallel closely the requirements specified for a plan for general medical services in that it must designate a single state administrative agency, provide for a dental advisory council, describe the financial participation required from the state and its governmental subdivisions, and so on One requirement is that the plan must set forth a statewide program designed and calculated within five years to provide for the annual inspection of the teeth of all children in the elementary and secondary grades of public and private schools and must provide for the care and treatment, including prophylaxis, filling, x-ray, extraction and related care, other than straightening, of the teeth of those children in the elementary and secondary schools whose family or guardian has insufficient income to pay for the whole cost of such services, as certified to the state agency by the principal or other head of the school at which the child is in attendance A state plan may, at the option of the state, provide dental care for those families and individuals in the state having insufficient income to pay the cost of such service

*Miscellaneous*—The other sections of this title follow in the main comparable sections in the title having relation to general medical services

### RESEARCH

Title II contains three parts relating to research in the fields of general medical health, neuropsychiatry and dentistry

*General Medical Health Research*—The following appropriations will be authorized for researches, demonstrations and training in the field of general medical health for each of five years beginning with the fiscal year ending June 30, 1947 for grants-in-aid through the National Institute of Health to universities and similar institutions for general medical research, not to exceed $2,000,000, and for medical research in, and operation of, the National Institute of Health, not to exceed $2,500,000

*Neuropsychiatric Research*—There will be authorized to be appropriated the following sums for research and scholarships in the field of neuropsychiatric health for the fiscal year ending June 30, 1947 for grants-in-aid for research and scholarships in neuropsychiatric health not to exceed $150 000 and for research and scholarships in neuropsychiatric health within the Institute of Neuropsychiatric Research not to exceed $300 000 For the following fiscal year these appropriations will be increased by $150,000 and $400,000 respectively and for each fiscal year thereafter the appropriation for grants in aid may not exceed $500,000 and for research and scholarships in neuropsychiatric health within the institute not in excess of $700 000.

There will be established in the National Institute of Health a division to be known as the National Institute of Neuropsychiatric Research, and there will be created a National Advisory Council on Mental Research consisting of the Surgeon General ex officio as chairman and six additional members to be appointed without regard to civil service laws by the Surgeon General with the approval of the administration The six appointed members will be selected from leading medical or scientific authorities who are outstanding in the study, diagnosis or treatment of mental or neuropsychiatric disorders, at least three of whom must be doctors of medicine and the others thoroughly familiar with neuropsychiatric conditions and problems in the United States Each appointed member will hold office for a term of three years except the original members, whose terms of office will be staggered Each appointed member will receive not in excess of $25 a day while attending conferences or meetings of the council or while otherwise serving at the request of the Surgeon General and an allowance for traveling and subsistence expenses

The National Institute of Neuropsychiatric Research, in cooperation with the National Council on Mental Research, will be specifically authorized to

1 Conduct, assist and foster research, investigation, experiments, demonstrations and studies relating to the causes, diagnosis, treatment and prevention of neuropsychiatric diseases and disorders

2. Promote the coordination of research conducted by other public and private agencies and make grants-in-aid to such public or private agencies

3 Provide scholarships in the institute and in other institutions receiving grants-in-aid

The National Advisory Council on Mental Research will have the following functions

1 To review research projects or programs submitted to or initiated by it relating to the study of the causes, diagnosis, treatment and prevention of neuropsychiatric diseases and disorders and to certify approval to the Surgeon General of any such projects which show promise of making valuable contributions to human knowledge in this field

2 To collect information as to studies which are being carried on and with the approval of the Surgeon General to make available such information through appropriate publication

3. To review applications from universities, hospitals, neuropsychiatric or similar institutions, whether public or private, or from individuals, for grants-in-aid

4 To recommend to the Surgeon General for acceptance conditional gifts and to make other recommendations to the Surgeon General with respect to carrying out the provisions of this part of the bill

The surgeon general may recommend to the administrator acceptance of conditional gifts for study, investigation or research, and donations of $50,000 or over may be acknowledged by the establishment within the National Institute of Neuropsychiatric Research of suitable memorials to donors

An appropriation not in excess of $4,500 000 will be authorized for the erection and equipment of suitable and adequate hospital, laboratory and related facilities for the use of the institute, the facilities to be constructed in or near the District of Columbia

*Dental Research*.—The provisions of the bill relating to dental research parallel those relating to neuropsychiatric research A National Institute of Dental Research will be established as a division in the National Institute of Health, which will function in cooperation with the National Dental Health Council in a comparable manner to that in which the National Advisory Council on Mental Research will cooperate with the National Institute of Neuropsychiatric Research An appropriation of $1,000,000 will be authorized for the erection and equipment of a suitable and adequate building and other facilities in or near the District of Columbia, for the use of the National Institute of Dental Research.

It is contemplated that for the year ending June 30, 1947 there will be appropriated a sum not to exceed $75,000 for grants in aid for dental research and training and not to exceed $175,000 for research and scholarships within the National Institute of Dental Research For the next year the appropriation for grants-in-aid may not exceed $150,000, and for research and scholarships $250,000 Thereafter the appropriation may not exceed $300,000 annually each for grants-in-aid and for research and scholarships

PAYROLL DEDUCTIONS

Title III provides that on the direction of any officer or employee of the government of the United States, requesting the government to deduct from the salary of such employee a fixed sum or percentage to be paid to any public or private health insurance fund, such sum or percentage shall be deducted and paid as directed by the employee or officer The term United States' is defined to include all departments, bureaus, agencies and other divisions of the government and also corporations the stock of which is wholly owned by the government. The term "public or private health insurance fund' will include any nonprofit organization undertaking to insure persons against the expense of hospital, medical or dental services or any other service connected with health

# National Health Program

## PLATFORM ADOPTED BY THE AMERICAN MEDICAL ASSOCIATION

*One of the ten points in this platform will be published each week*

**7 A program for national health should include the administration of medical care, including hospitalization, to all veterans, such medical care to be provided preferably by a physician of the veteran's choice, with payment by the Veterans Administration through a plan mutually agreed on between the state medical association and the Veterans Administration**

# Medical Legislation

## MEDICAL BILLS IN CONGRESS

### U S Employees' Compensation Act

The Senate Committee on Education and Labor has reported, with amendments, S 178, proposing to amend the United States Employees' Compensation Act to permit chiropractors to treat employees entitled to the benefits of that act.

### Optometry Corps

President Truman has vetoed H R 3755, proposing to establish an Optometry Corps in the Medical Department of the Army In the opinion of the President the creation of such a corps would be out of harmony not only with the present structure of the Medical Corps but also with the contemplated organization of the Medical Department of the postwar army

### Army Medical Department

H R 6175, introduced by Representative Lane Massachusetts, provides that for the purposes of promotion longevity pay and retirement there shall be credited to officers of the Medical Department of the Army all service as interns in army hospitals performed in a civilian-employee status

### Miscellaneous

H R 6369, introduced, by request by Representative McMillan, South Carolina, provides for the voluntary admission and treatment of mental patients at St. Elizabeths Hospital

H R 6385, introduced, by request by Representative McMillan South Carolina, proposes to regulate the manufacture, sale, distribution and use of barbiturates in the District of Columbia

President Truman has submitted to the Congress a supplemental estimate of appropriation for the fiscal year 1946 in the amount of $2,148 800 for use by the Department of Labor in making grants to states for continuation of the E. M I C program (H Doc. 554)

H R. 6305 has passed the House, proposing to make permanent the provisions of the act of July 11 1941 prohibiting prostitution in the vicinity of military and naval establishments

The Senate Committee on Education and Labor has reported with amendments, H R 4512, proposing to provide for research relating to psychiatric disorders and to aid in the development of more effective methods of prevention, diagnosis and treatment of such disorders

By request, Representative Rankin, Mississippi, has introduced H R. 6272, proposing that a veteran's pension compensation or retirement pay shall not be reduced during his hospitalization or domiciliary care.

H R 6089, introduced by Representative Hand New Jersey, would require the Veterans Administration to furnish to all honorably discharged veterans of World War II who are certified by the administration to be true paraplegic cases, specially designed automobiles to enable the veterans to engage in useful occupations

Hearings are being held by the House Committee on Foreign Affairs on H R 4502, a bill introduced by Representative Neely, West Virginia, proposing an appropriation of $100,000,000 for use in research to discover means of curing and preventing cancer

## STATE LEGISLATION

### Louisiana

*Bill Introduced*—H 87 proposes to authorize the department of institutions to construct, purchase or otherwise acquire, equip and maintain hospital facilities for the care of persons suffering from chronic illnesses (excepting mental illness and tuberculosis) and defines the term "chronic illness" as "a disabling illness of anticipated long duration requiring medical and/or nursing care." It also proposes an appropriation for the aforementioned purposes

### Missouri

*Bill Passed*—H 830 passed the senate May 13 It proposes that county courts be authorized to promulgate such rules, regulations or ordinances as will tend to enhance the public health and prevent the entrance of infectious, contagious, communicable or dangerous diseases into the county

## Coming Medical Meetings

## Washington Letter

*(From a Special Correspondent)*

May 20, 1946

### Public Reported to Be Unfamiliar With Wagner-Murray-Dingell Bill

George Gallup, director of the American Institute of Public Opinion, whose syndicated Gallup Poll is published daily in newspapers here and elsewhere throughout the country, reports that the general public has not yet become familiar with the Wagner-Murray-Dingell medical insurance bill Mr Gallup states that fewer than four in every ten persons polled had heard or read about it, and opinion was almost evenly divided on whether people would get better medical care if the government should take over a health insurance program The Washington chapter of the Physicians Forum has challenged the Medical Society of the District of Columbia to a June debate on the bill

### Veterans Administration Undertakes Program for Brain Injuries

Dr Pearce Bailey, chief neurologist during wartime of the Philadelphia Navy Hospital, will direct a special medical program for veterans suffering from brain, spinal cord or nerve injuries and from epilepsy which the Veterans Administration is launching About one third of the 45,000 patients in veterans hospitals are reported to be suffering from organic neurological disorders, and 20,000 servicemen are under treatment in army and navy hospitals The council of the American Neurological Association will serve as an advisory board, and the American Epilepsy League will assist the program

### Court Appointment of Medical Witnesses

Associate Justice James M Proctor of the District of Columbia court suggested at a meeting of the Medical Society of the District of Columbia that courts should appoint a group of physicians to serve as expert medical witnesses He said that such a panel "would lend public confidence in the administration of justice" and would "relieve members of the medical profession from embarrassment and from suspicion that their testimony was governed by the side that paid them" Justice Proctor spoke on a three man panel at the conclusion of a talk by Dr James M Gannon, Washington surgeon, on "The Expert Medical Witness"

### Health Plans Proposed for Interstate Industries

Outgrowth of John L Lewis's battle for a huge health fund to be administered solely by the union is a Senate proposal that every industry engaged in interstate commerce be required to inaugurate worker health programs Senator Pepper, Democrat of Florida, says that an argument for health plans is the fact that workers lost more time by illness than by strikes The idea of requiring industries to set up health programs is a counter proposal to the move by Senator Byrd, Democrat of Virginia, to outlaw union collection and control of any such health and welfare fund as Lewis has demanded from the soft coal mine operators

### Artificial Limb Trial Resumes Sessions

The eight remaining defendants in the antitrust trial of artificial limb manufacturers, three individuals and five companies, have waived jury trial Federal Judge Bower Broaddus of Oklahoma opened proceedings May 9 but recessed them to permit a defense lawyer to return to Minnesota to argue another case. Thirty firms and thirty three individuals pleaded nolo contendere, were found guilty and will be sentenced May 24 Earlier, charges against seven other defendants had been dismissed for various reasons

### Army Defends Delays in Discharge of Dentists

The Office of the Surgeon General of the Army has released a defense of its policy of holding discharge requirements for dentists to thirty-nine months' service while doctors are released in thirty months The disparity was criticized by dental officers as an injustice, but army officials explained that it had to be done because replacements were not available. Doctors can now be replaced Since V-E day 9,424 of about 15,000 dentists in service have been released

# THE WAGNER-MURRAY-DINGELL BILL

## Hearings on S 1606—To Provide for a National Health Program

(NOTE.—*This is a condensation of the verbatim report of the hearings*—ED.)

*(Continued from page 239)*

United States Senate, Committee on Education and Labor

APRIL 18 1946

HONORABLE JAMES E MURRAY Presiding

PRESENT Senators Murray, Pepper, Ellender and Donnell

### Statement of Dr Ernst P Boas, Chairman Of the Physicians Forum

DR. BOAS The Physicians Forum unequivocally supports the bill under consideration, S 1606 As practicing physicians we know better than any other group of fellow Americans the present deficiencies in medical care, the needless suffering and death constantly occurring throughout this land because of bad distribution and scarcity of doctors and hospitals in many communities We know that many persons cannot afford to buy ordinary medical care and that few can cope with the costs of catastrophic illness

No one challenges the principle of the use of public funds for the prevention of disease. But the prevention of disease today involves much more than the old line activities of the public health officer—sanitation and vaccination. Today the chronic, so-called degenerative diseases, such as the heart diseases high blood pressure, diabetes, cancer and chronic rheumatism, are the great hazards to life and health Today we can no longer say "This, on the one hand, is preventive medicine, a proper function of government, and this, on the other hand, is curative medicine, the function of the practitioner of medicine whose services must be bought in the open market." These two aspects of sickness control have become merged, preventive medicine begins with measures of personal hygiene and health examinations conducted by the medical practitioner So it is a logical and natural step to turn to government for funds to extend adequate medical care to all citizens of this country Because of the uneven distribution of wealth in the United States the federal government must assume responsibility The increasing mobility of our population also makes it necessary that health plans be national in scope, so that the worker will not lose his benefits when he moves from one state to another

The administrative and organizational features of the bill are well conceived. Quite properly the Surgeon General of the United States Public Health Service is the administrator The opponents of this legislation have raised the cry that the Surgeon General would become the "medical dictator' of the nation Nothing could be further from the truth

It is also falsely charged that all details of medical care would be run from Washington by a horde of bureaucrats Once more the provisions of the bill itself give the lie to this argument Actually all that the federal government would do is what is necessary to the success of any national plan—collect the money and set up minimum standards to be followed by all doctors and hospitals Decentralization of administration is assured by the instruction that the Surgeon General utilize as far as possible the services of state and local advisory and technical committees to advise in administration The bill does not affect the present setup of medical practice. Doctors may refuse patients, patients may choose doctors Unfortunately, even the fee-for-service system of payments to practitioners is allowed if practitioners so elect. We say 'unfortunately," because it is an accepted fact, based on experience, that no health insurance plan has been able to function with fullest efficiency under the fee-for-service system It creates a huge amount of paper work for physicians and the administration, and it leads to inevitable abuse by doctor and patient. We predict that physicians will be the first to repudiate this method of payment.

*(Dr Boas emphasized the virtues of group practice)*

Additional provisions are needed in the bill to safeguard the physicians rights and privileges There should be some specific provision assuring that the income of physicians will conform on the average to levels at present current in more prosperous communities of the United States, with due consideration to the fact that income levels should actually be somewhat higher than they are today, because the physician will be paid for much of the work he today does without compensation There should be provisions enabling the physician to pursue postgraduate study and to take appropriate vacations without loss of income

The essence of the arguments presented by the opponents of this bill is that it would bring about a system of "state medicine" or "socialized medicine." What is this great bugaboo we have been taught to fear? The terms as used today have an emotional, not a factual, connotation, they are catchwords employed to arouse emotional resistance to plans to improve or change the methods of distributing medical care. Chief among those opposed to national compulsory health insurance is the American Medical Association and its satellite the National Committee of Physicians The American Medical Association has always opposed public action in any field of medical care except in the case of the indigent It is common knowledge that it opposed the establishment of workmen s compensation insurance, of the Blue Cross hospital insurance plans and until recently it relentlessly fought plans for voluntary medical care insurance

The American Medical Association is in fact serving as a guild battling to retain the economic privileges of the medical profession In this campaign it has allied itself with businesses that are purveyors of commercial aspects of medical care—with pharmaceutical houses, makers of surgical instruments and appliances and certain insurance companies and through the agency of the National Physicians Committee it has obtained substantial funds from these sources to carry on its propaganda

While the American Medical Association accepts and encourages the business transformation that the modern industrial era has brought about in the practice of medicine, the Physicians Forum recognizes the evils that this change has entailed their destructiveness to the medical profession and their harm to the patients whom it serves Through such a national health program as is proposed in S 1606 most of the financial handicaps that have prevented the extension of good medical care to all citizens will be lifted and physicians will be free to rededicate themselves fully to the prevention of disease and the treatment of the sick.

SENATOR MURRAY Doctor you have mentioned the National Physicians Committee Will you tell us what the National Physicians Committee is and how it was set up?

DR BOAS The National Physicians Committee is an outgrowth of Mr Gannet s Committee on Constitutional Government. Originally, I have forgotten when I think in 1939 he called together a large number of physicians and urged them to establish such a committee to back his general policies, and out of this grew the National Physicians Committee

SENATOR MURRAY Are these physicians members of the American Medical Association?

DR BOAS Yes I think all of the officers of the National Physicians Committee are prominent members of the American Medical Association, ex-presidents and other officers, and the House of Delegates of the American Medical Association in repeated resolutions has approved of the activities of the National Physicians Committee.

*(Through questions by Senator Murray Dr Boas attacked the National Physicians Committee and voluntary insurance plans)*

SENATOR ELLENDER What is the membership of the Physicians Forum? DR. BOAS Approximately one thousand

SENATOR ELLENDER I notice that you say that all the members of that group belong to the American Medical Association or to the National Medical Association. DR BOAS That is right.

SENATOR ELLENDER How many belong to the American Medical Association of that group? DR BOAS I cannot tell you for certain, but I imagine that we have only about 40 or so who belong to the National Medical Association

SENATOR ELLENDER To the National Medical Association? DR. BOAS Yes, sir, that is the medical association of the Negroes The reason we have that provision in is that all doctors can join the American Medical Association only through their county societies In the North, Negroes are admitted to county societies, so they can join the American Medical Association, and in the South they cannot, and so they are unable to join the American Medical Association, so that is why we have that provision

SENATOR ELLENDER To what extent did your group help in perfecting the legislation we now have under consideration? DR BOAS Well, we presented analyses of the first Wagner-Murray-Dingell bill, criticizing various aspects of it, and sent them here to Washington to the Senators and to the Social Security Board, and we had a number of subsequent conferences with them about certain details, and some of our recommendations were accepted and some were not.

SENATOR ELLENDER As among the doctors of the country, the Physicians Forum has been the mainspring back of this legislation that we are now considering? DR. BOAS Really, this was a committee of physicians for the improvement of medical care I think the Physicians Forum and the Committee of Physicians have been the two physicians' organizations supporting this

SENATOR ELLENDER Which is this other? DR BOAS The Committee of Physicians

SENATOR ELLENDER What is that? DR BOAS The Committee of Physicians for the Improvement of Medical Care was established, I cannot tell you the exact date

SENATOR ELLENDER Before or after this? DR BOAS It was before

SENATOR ELLENDER What is the membership, do you know? DR BOAS They have only a relatively small committee, but then they have a large number—

SENATOR ELLENDER Of how many? DR BOAS About twenty-five, and then they have a large number of physicians who subscribe to their principles and proposals

SENATOR ELLENDER They, of course, also backing this legislation that we are now considering? DR BOAS Yes, sir

SENATOR ELLENDER To what extent did that committee aid in preparing or submitting data for the legislation we are now considering? DR BOAS They acted much as we did

SENATOR ELLENDER Where is your membership confined to, in what states? DR. BOAS About two thirds of them are in New York State, and the rest are scattered throughout the country from Maine to California.

SENATOR ELLENDER Two thirds from New York State so that you have about in the neighborhood of three hundred from the rest of the country? DR BOAS Yes

SENATOR ELLENDER When you say "Doctors may refuse patients" you mean all doctors that are qualified to practice in any state, or do you mean doctors that will submit to the plans that may be prepared through the Surgeon General? DR BOAS What I meant in that statement specifically was that an individual doctor has the privilege of refusing an individual patient. In other words, if a man elects to serve under the insurance fund and patient X says 'I want you" and the doctor does not like that, the doctor says "I prefer not to take you on," but in addition to that, of course, no doctor is compelled to serve under the insurance scheme That is quite voluntary

SENATOR ELLENDER I am glad that you admit that, doctor DR BOAS I think it is right in the bill

SENATOR ELLENDER So that if he does not desire to join, as it were or submit to the rules and regulations that may be agreed on at Washington, he cannot be used, as it were, by patients who pay in and who are entitled to the service? DR. BOAS A doctor who is not enrolled with the insurance fund cannot treat patients who are insured and receive payment from the insurance fund.

SENATOR ELLENDER So in order for a doctor to be able to serve, he will have to submit to this plan There is no alternative? DR. BOAS In order to be able to serve the insured people? SENATOR ELLENDER Yes DR. BOAS Unless they choose him voluntarily

SENATOR ELLENDER And also unless they pay extra? DR. BOAS Yes, sir

SENATOR ELLENDER So they would be paying into the fund a certain percentage of their salary and if they desired to obtain the services of a doctor of their own choosing who is not a member of the plan or who has not joined this plan, they will have to pay two ways? DR. BOAS That is right.

SENATOR ELLENDER So there is no question in your mind about that? DR. BOAS That is a fact

SENATOR ELLENDER Now, how do you say, or what did you mean when you said "Doctors may refuse patients and patients may choose doctors"? You limit that, of course, to the doctors who submit to the plan and to the patients who, by virtue of paying out of their salaries so much, are entitled to services? DR BOAS I would say limited to the doctors who voluntarily enroll in the plan But as a matter of fact we know I think of experience that, if this legislation was to go into effect, within a few years between 80 and 90 per cent of the doctors of this country would enroll

SENATOR ELLENDER They would be forced to, I grant you that I agree to that, if you put this thing over, if this law is enacted as it is now written, I am sure of that, but it will not be on a voluntary basis It will be a question of necessity, they will have no other alternative or else starve to death

SENATOR ELLENDER Well, Dr Boas, if a third of the doctors of the country refuse to join the plan, that means to say that the two thirds that do join are going to have the greater part of the work to do, will it not? DR BOAS No, they would have more work to do than they could handle.

SENATOR ELLANDER They would be paid in proportion to the amount of work they do, and therefore their rate of income would necessarily increase, would it not? DR BOAS Under such circumstances it would.

SENATOR ELLENDER Do you not think that that is possible unless all join? DR. BOAS Well, I am quite sure that the overwhelming majority of doctors would join

SENATOR DONNELL You are the chairman of the Physicians Forum? DR BOAS That is right

SENATOR DONNELL Is that the chief executive officer of the Forum, or is there a president also? DR. BOAS No, that is the chief executive officer of the Forum

SENATOR DONNELL And you have been occupying that office for how long? DR BOAS Six years

SENATOR DONNELL Do you know the number of members approximately that the Forum has, we will say in the Central West, in Missouri and Kansas and in Nebraska and states of that type? DR BOAS I do not think that we have very many, I think we just have a scattering in these particular states We have a fair number in Illinois

SENATOR DONNELL Your members are largely in states having the largest cities, is that right? DR. BOAS I suppose that that is correct, yes, sir

SENATOR DONNELL I believe you said about six hundred of them are in New York State? DR. BOAS Yes, sir

SENATOR DONNELL That would leave, as Senator Ellender pointed out, about three hundred scattered over the rest of the country? DR BOAS Yes, sir

SENATOR DONNELL You are also a member of the American Medical Association, are you not? DR. BOAS I am

SENATOR DONNELL In fact, I believe you stated in your testimony that all the members of the Physicians Forum are members either of the American Medical Association or of the National Medical Association? DR BOAS Yes, sir

SENATOR DONNELL And the National Medical Association is constituted of Negroes? DR BOAS That is correct

SENATOR DONNELL Now, Doctor, when the President issued his message of November 19, 1945 you sent him a telegram, did you not? DR. BOAS Yes, sir

SENATOR DONNELL In which you said right at the outset "Our membership, composed largely of practicing physicians throughout the country who belong to the American Medical Association most warmly commend you for your able and comprehensive message to the Congress on the state of the nation's health" You were not in any sense criticizing the American Medical Association in that statement, were you? DR. BOAS No

SENATOR DONNELL Were you using that sentence with respect to membership in the American Medical Association as indicating any hostility to the Association or as indicating any feeling that the Association was not an organization of high standing? DR. BOAS No

SENATOR DONNELL It does consist, does it not, Doctor, of approximately 125,000 of the physicians and surgeons of the country? DR. BOAS Certainly

SENATOR DONNELL And you have been a member of it and still are a member of it? DR. BOAS I am

SENATOR DONNELL Now, you say in your statement that the American Medical Association is in fact serving as a guild, battling to retain the economic privileges of the medical profession Do you regard it as inconsistent at all that ou should remain in that association if its purposes are to "serve as a guild,

battling to retain the economic privileges of the profession"? DR BOAS The American Medical Association has a good many functions Its educational and clinical functions have, on the whole, been excellently carried out and my only point of disagreement with the American Medical Association is in this field of medical economics, and I see no reason to withdraw from it but as a matter of fact, one of the reasons why the Forum was established was that many doctors were rather shocked by the public statements of the American Medical Association in this field and felt it necessary that a group of doctors should be established who could have their own avenues for expressing radically different opinions

SENATOR DONNELL And yet it remains true does it not, Doctor, to be a member of the American Medical Association is not regarded as a reproach against a physician but rather as an indication of his interest and standing in the profession? DR BOAS That is certainly correct

SENATOR DONNELL And, as you have said, along scientific and educational lines of medical nature and surgical nature you regard the work of the Association as eminently helpful to the nation, do you not? DR BOAS Absolutely

SENATOR DONNELL And you simply disagree with the Association on this particular policy with respect to compulsory health insurance and matters of that type? DR BOAS That is right.

(*Senator Donnell questioned Dr Boas on the Committee on the Costs of Medical Care*)

SENATOR DONNELL Now, Doctor, in your statement which you have given to us here you feel that the American Medical Association, as you say, is in fact serving as a guild battling to retain its economic privileges What do you mean by 'economic privileges" there? DR. BOAS Well today the practice of medicine is a highly individualistic activity I guess doctors are more independent and more dictatorial within their own little spheres than any other people, which arises out of the nature of their work and their relationship to patients If a doctor is successful in developing a special practice and gaining recognition in one way or another, he can have a very substantial income, as we know, and it is these successful doctors who to a large extent are the ones who are governing the policies of the American Medical Association, and there is no doubt that although the lot of the average doctor would be improved by a bill such as this the very large incomes of some surgeons and specialists would in the long run be deflated

SENATOR DONNELL Do you think, Doctor, that the average member of the American Medical Association with whom you have come in contact realizes that this bill S 1606 or a plan of that type would improve the average economic welfare of the practitioners? DR. BOAS No he does not, because he is given no opportunity to learn You see the medical press is closed to any discussion of this bill here The American Medical Association and the state journals and the county journals, with a very few exceptions, refuse to publish any opinions favoring this bill and they publish only destructive attacks on the bill, many of which are very inaccurate. So that the average doctor has very little opportunity to know what it is all about

(*Senator Donnell led Dr Boas to admit that the House of Delegates as a representative body speaks for the members of the American Medical Association*)

SENATOR DONNELL How is the Physicians Forum financed, Doctor? DR BOAS By voluntary contributions

SENATOR DONNELL Do you know what the annual budget is? DR. BOAS It has varied from year to year according to our income

SENATOR DONNELL Yes? DR BOAS For many years we relied almost exclusively on contributions from the doctor members In the past year we have been more successful in getting some large voluntary contributions

SENATOR DONNELL Do you recall approximately the total income of the Physicians Forum in the year 1945? DR. BOAS I should estimate it at approximately $12 000

SENATOR DONNELL About $12,000 and do you know what it has run so far this year, 1946? DR BOAS Well we just had an affair at which we raised money and which I imagine will have to carry us through most of the year

SENATOR DONNELL How much did you raise at that affair? DR. BOAS $6 000

SENATOR DONNELL $6 000 DR BOAS And otherwise we have got in maybe 2 or 3 thousand.

SENATOR DONNELL Is the affair to which you refer a Physicians Forum dinner at the Hotel Waldorf Astoria held on April 11? DR. BOAS Yes

SENATOR DONNELL There was an invitation sent out to that by you to the general effect as follows The Forum is holding a dinner at the Waldorf Astoria on Thursday, April 11 to honor Senator Wagner, Senator Murray and Representative Dingell Tickets, $7 50 Your formal invitation, with the names of other distinguished guests, will reach you in a few days Meanwhile, please file this note in your diary ' That went out to a list of gentlemen, did it not? DR BOAS It did

SENATOR DONNELL And at that meeting these funds were raised to which you refer Now, Doctor, in addition to your own organization there are numerous others giving expression of views favorable to S 1606 as, for illustration the Committee on Medical Care. Do you know that organization? I believe Mr Michael M Davis is chairman Do you know that organization? DR BOAS I think you have the title incorrect

SENATOR DONNELL Possibly I do DR. BOAS There is the Committee on the Nations Health, in which Dr Davis was active

SENATOR DONNELL There is also the Committee on Research and Medical Economics, that committee for which Mr Michael M Davis signs in some capacity on its letterhead You are familiar with that organization? DR BOAS As far as I know they are a research group They have not done any propaganda or public education at all

SENATOR DONNELL This particular group the Committee on Research and Medical Economics, is located at 1790 Broadway New York, and Mr Michael M Davis is the chairman? DR BOAS Either that or the executive secretary

SENATOR DONNELL And you are on the board yourself? DR BOAS Yes

SENATOR DONNELL And there is an editorial board of the *Quarterly Journal* and you are on that board? DR. BOAS Yes but the *Quarterly Journal* is a suspended publication

SENATOR DONNELL And I ask you Doctor, if this committee issued a booklet consisting of some thirty-four pages which I hold in my hand entitled "Principles of a Nationwide Health Program' Did it issue that booklet? DR BOAS Yes

SENATOR DONNELL Your name appears on the outside? DR BOAS As one of the participants

SENATOR DONNELL And among the others are Mr I S Falk, Mr Basil C MacLean Mr Michael M Davis and Dr John P Peters Was Dr Peters on that committee? DR. BOAS This was a temporary group to study these principles

SENATOR DONNELL But it did issue this report and it is stated 'This report, with its twenty-nine sponsors is published with the cooperation of the Committee on Research and Medical Economics ? DR BOAS That is true.

SENATOR DONNELL The expenses of the conference and this publication were met by gifts contributions for this purpose is that true? DR BOAS Yes

SENATOR DONNELL Do you know of a so-called organization called the Group Health Organization?

SENATOR MURRAY Senator before you leave that I would like to have the witness furnish the committee with a copy of this report for our records that the Senator has been examining

DR. BOAS Yes, sir I am sure we can

SENATOR DONNELL Do you recall, Doctor, who made the major gifts referred to in this foreword of the health program committee conference? DR. BOAS I do not know I had nothing to do with the financial end

SENATOR DONNELL I will ask you if you know also of an organization which had a telegram sent in here yesterday addressed to the Committee for the Nations Health Do you know that organization? DR BOAS Yes

SENATOR DONNELL Are you a member of that also? DR. BOAS I am

SENATOR DONNELL And Dr Peters is also in that organization is he not? DR. BOAS I believe so

SENATOR DONNELL Doctor I cite these as illustrative of the fact that not all of the information being given out with respect to this bill is coming from opponents There is likewise a very active campaign being made by numerous people who believe in the bill too That is right, is it not? DR ROAS That is right

SENATOR DONNELL Doctor, in your testimony you refer to the argument that the opponents of the legislation have raised as you stated that the Surgeon General would become the medical dictator of the nation and you state nothing could be further from the truth And then you say the bill provides that he is responsible to the Federal Security Administrator" Do you mean to imply by that that if there is any dictatorship it does not vest in the Surgeon General but rather in the federal security administrator? Is that what you mean? DR BOAS No My meaning was that that was one safeguard and the advisory council was a further safeguard, as well as the general setup of the bill

SENATOR DONNELL Now as a matter of fact, Doctor, even the appointment of the members of the advisory council is confined to persons who meet the approval of the federal security administrator, is it not? DR BOAS It is

SENATOR DONNELL Would you say, Doctor, that the quality of medical care that has been given, generally speaking, under the English compulsory insurance has been of as high a type as American physicians generally give to their patients? DR BOAS Probably not

SENATOR DONNELL Doctor, have you read *Barron's National Business and Financial Weekly* for April 8, 1946? DR. BOAS No

SENATOR DONNELL Are you acquainted with a lady by the name of Elizabeth W Wilson? DR. BOAS No

SENATOR DONNELL Who has written an article entitled "Hazards of Compulsory Health Insurance Enormous Prospective Costs of Political Medicine Not Well Understood"? Have you read that? DR BOAS I think I glanced through it the other day

SENATOR DONNELL Was Miss Wilson at one time with the Social Security Administration here in Washington? DR. BOAS I have no idea

SENATOR DONNELL I will read you the closing four sentences of that and ask you to state whether or not you are informed as to the correctness or incorrectness of the facts alleged therein. She says

> It is not surprising that the workers distrusted this type of medicine In 1936 about 600 000 British workers renounced their right to medical care under the insurance system by failing to register on the panel In the same year one third of the French workers who were eligible for insurance did not qualify for it These facts underscore the question as to the medical success of health insurance

Doctor I am not asking you to state whether you agree with the conclusion, but are her historical facts with respect to British and French workers as set forth in this excerpt of it correct or not? DR BOAS I have no idea on that.

(*Senator Donnell questioned Dr Boas on the right of free choice under the bill*)

SENATOR DONNELL So to that extent there is a restriction on the right and power of the people to get on that panel? That is true, is it not?

DR BOAS Yes But there is virtue in that restriction, because the only reason for that restriction is because we know if a doctor sees too many patients—and we have doctors who see 50 or 60 patients a day—they practice very sloppy medicine. Whether they do it under any system, it is not good for the patient

SENATOR DONNELL But the thought I was driving at is that there is a restriction, regardless of whether it is meritorious or justified, here is a restriction? DR BOAS There is a restriction

SENATOR MURRAY And that situation exists today That is to say, that a doctor who becomes quite famous cannot take everybody He cannot take the practice of the entire community even though he is sought by the entire community

DR. BOAS What actually happens, Senator Murray, is that when a doctor becomes so successful that he has more patients than he can handle he jacks up his fees and therefore he eliminates the free choice of physician, because the poorer people cannot come to him

SENATOR MURRAY We cannot adopt that system in this bill, so we adopt the other device of protecting the patients and giving them good service by this method? DR BOAS Yes

SENATOR DONNELL Now, regardless of the merit or demerit of the suggestion in the bill, doctor, the fact remains, does it not that today without this bill being in effect if you or I get sick and go to Dr Jones, if Dr Jones in his judgment thinks he can take us there is no legal restriction against his doing so? DR BOAS There is not

SENATOR DONNELL There is no legal restriction against our trying to get on his list? DR BOAS That is true

SENATOR DONNELL It is true that he may find that he cannot take us which after all, is his judgment rather than the Surgeon General's action, or his deputy's, to say whether he does or does not take a patient? DR BOAS Yes

SENATOR DONNELL Whereas under the bill S 1606 there is a restriction to the extent I have indicated? That is correct, is it not? DR BOAS That is correct.

SENATOR DONNELL So your statement, from which I quoted, "All people will have free choice of physicians," et cetera, will have to be interpreted with that exception I have mentioned, at least, would it not? DR. BOAS Yes

SENATOR DONNELL I want to inquire about something which I am free to say I do not know, and I am asking for enlightenment. I want to ask you whether or not you think that a person under this bill would have the right to select an osteopath to perform services for him or are osteopaths included within the term "physician" as mentioned in the bill? I might amplify that by asking you to tell us whether or not you think services in osteopathy would be included under the term "personal health service benefits" inasmuch as that is defined in section 214 as "includes general medical benefit, special medical benefit, general dental benefit, special dental benefit, home nursing benefit, laboratory benefit and hospitalization benefit." So that my question, which is entirely too long, resolves itself into two questions First, whether or not osteopaths are included in your opinion within the term "physician" and, in the second place, whether or not the services they render are "personal health service benefits" to which persons are entitled under this bill? DR BOAS I do not know that I can answer that categorically I believe they would be covered by the individual state laws, as I recall the section, and I cannot find it immediately

SENATOR MURRAY Is that section 205 (a)? page 45 DR. BOAS There is a statement that "any physician, dentist or nurse legally qualified by a state to furnish any services included as personal health service benefits under this bill shall be qualified to furnish such services as benefits"

SENATOR DONNELL May I interpolate this at that point, so that you may have the thought in my mind before you. I observe that language "any physician, dentist or nurse legally qualified by a state " That raises the question "Is an osteopath a "physician"? I assume that he is 'Any physician, dentist or nurse legally qualified by a state to furnish any services included as personal health service benefits " The term "personal health service benefits' is defined, as I indicated, to include "general medical benefit, special medical benefit, general dental benefit, special dental benefit home nursing benefit, laboratory benefit and hospitalization benefit.' The query in my mind is, even though a physician qualified by a state is within this bill, inasmuch as there is a further qualification that it is only those physicians who are qualified to furnish general medical benefits, or special medical benefits whether or not osteopaths are included in the term "physician in view of those remarks on the meaning of the term "personal health service benefits" That is the thought in my mind. DR BOAS All I can say is I hope not

SENATOR DONNELL You hope they are not. Your thought would be if they are included that the bill should be amended and exclude osteopaths, is that right? DR BOAS I think that would be preferable

SENATOR DONNELL Do you have any idea how many osteopaths there are or how many persons are patients? DR. BOAS I do not know, sir

SENATOR DONNELL I take it it runs into the millions, probably, of persons who are patients of osteopaths DR BOAS I really do not know

SENATOR DONNELL We will leave aside the number There are certainly quite a considerable number of people who believe in osteopathy and go to osteopaths? DR BOAS Yes

SENATOR DONNELL Doctor, may I ask you what you think of the fairness or unfairness of a bill which would require every person, whether he believes in not going to medical doctors but in going to osteopaths that requires him to contribute to a fund here which could only be used according to your hopes in the payment of medical doctors as distinguished from osteopaths? Do you think it fair, if you and I believe in osteopathy and want to go to an osteopath that we will have to pay into this fund and then go and spend our money separately for osteopathy?

DR BOAS I think two answers can be given to that. First of all you can make the analogy between education and recognize the fact that everybody believes in school taxes although they may send their children to private schools or parochial schools, and nobody contests the justice of that. I believe health is of just as fundamental interest to the nation and life as education and that therefore universal support of the health facilities is a justified general tax Now the trouble with the rest of the argument, if you accept osteopaths you might accept chiropractors and naturopaths and all that Medicine and the practice of medicine is a scientific proposition it is not a matter of belief It is a matter of fact. Anybody who has given scientific and objective study to the matter knows that these other systems of medicine are not based on fact but on fancy As a matter of fact, the few osteopathic schools remaining are adopting more and more of a general medical curriculum, and it is just a matter of time before they will be absorbed in medicine Every osteopath I have spoken to regrets that he is not an M D I do not think the exclusion of these special cults is objectionable at all

SENATOR ELLENDER At this point, Mr Chairman I would like to insert into the record a statement from the Louisiana State Medical Society on this matter

SENATOR MURRAY That may be done

*(To be continued)*

# Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS EDUCATION AND PUBLIC HEALTH)

## CALIFORNIA

### Maternity Service and the National Health Service Bill

The Royal College of Obstetricians and Gynecologists has submitted to members of Parliament a memorandum expressing with considerable concern its views as to the proposals in the National Health Service bill for the administration of the maternity service The memorandum states that it has long been recognized that one of the major defects in our existing services is the duality and, in some places, the multiplicity of control and responsibility that exists In a recent report on a national maternity service the college gave evidence for its conviction that the care of the pregnant woman, whether at home, at the clinic or in the hospital, is a responsibility that cannot be discharged with maximum safety to the two lives at stake if it is shared between different administrative bodies The argument that the uninterrupted continuity of control which is essential for safety can be achieved within a dual system by suitable administrative adjustments is opposed to the lessons of obstetric history The college notices with grave concern that the proposals in the bill will seriously endanger existing schemes in which unitary control prevails and which are being successfully operated by certain local authorities and voluntary agencies

The college is convinced that the special conditions which apply to maternity make it imperative that each administrative unit must embrace the various elements of the service It welcomes the proposals for the setting up of regional medical boards, for by regional planning alone can adequate provision and equitable distribution of maternity hospital accommodation and specialist service be secured But the advantages of this planning will be gravely reduced if it fails to weld together the hospital and the specialist, on the one hand, and the domiciliary and antepartum services, on the other hand In conclusion the memorandum states that the importance of complete coordination in reducing maternal and infant mortality is so great that the provision of a coordinated scheme for all aspects of maternity work must be placed unequivocally on one authority at regional level

### The Demographic Consequences of the War

It will probably be many years before the full consequences of the greatest war in history can be fully estimated An important report on the demographic consequences has been made by the international committee for the Study of the European Demographic Consequences of the War The loss of life to the Germans was 3½ million but to their opponents four times as great, nearly 15½ million Russia sustained the greatest loss, 7 million Poland lost nearly 4½ million, nearly all civilians, as the result of massacre or ill treatment The British losses of life amounted to 400 000 290,000 in armed forces, 62 000 among civilians and 45,000 in the merchant navy Like the Germans but unlike the rest of Europe, because the country was not occupied, the British military casualties far exceeded the civilian

Hitler had a definite demographic policy—to increase the German population and decrease the populations of other peoples This he carried out with the usual German ruthless efficiency Even before the war he did everything possible to stimulate the German marriage and birth rate During the war the mass exploitation of the millions of slave workers deported from other European countries allowed the industrial conscription of German women to be avoided so that they could be left to breed The deportation of foreign labor separated men from their wives and reduced the birth rate in the other countries The report estimates this separation at 11 to 12 million, which includes prisoners of war Hitler's population policy was pursued further on other lines by cutting to starvation level the food of peoples in occupied countries and by their mass massacre The final and astonishing conclusion of the committee is that while the population of the occupied countries has decreased the population of Germany has actually increased from 65 to 74 million as a consequence of the war This increase is explained by the postwar deportation of Germans on a large scale from Poland and Czechoslovakia

### Penicillin and Yellow Fever Vaccine by Flying Boat

The Ministry of Health has published new regulations which provide for an increased standard of purity for preparations of penicillin to be used for parenteral injection, by exclusion of the crude filtrates permitted previously Penicillin is to be issued only in the form of a dry salt or other dry substance, or *in some form approved by the Licensing Authority* The minimum potency of penicillin is increased to 300 units per milligram for preparations in a solid form and to 2,000 units per cubic centimeter for preparations in solution

Monthly consignments of penicillin and yellow fever vaccine are to be carried by British Overseas Airways Corporation to Bahrein on the Persian Gulf for the government hospital there. Instructions have been given to the staffs along the route with regard to the vaccine, which has to be maintained at the correct temperature during its passage through the tropics The officials will be responsible for adding ice at intervals of approximately sixteen hours The vaccine will be packed in England at the correct temperature in half gallon vacuum flasks

## ITALY

*(From Our Regular Correspondent)*

NAPLES, March 28, 1946

### Prices of Medicaments

American drugs are in great demand in Italy Unscrupulous people have profited by this by establishing a black market with enormous profits A fall in prices may be expected soon as the result of the production of Italian drugs which could not be produced during the war A secondary factor for the lowering of prices for American drugs is the fear of people in the black market of losing money This depends on the official monetary exchange as recently fixed by authorities of the Allied Forces and the Italian government Prior to February $1 was worth 100 Italian lire, since February the dollar has been worth 225 lire One sterling pound in paper could be purchased before February for 400 lire, whereas now it costs 900 lire. However before February the exchange of lire into dollars and sterling pounds was limited to those who could fulfil certain commercial requirements, which people in the black market lacked. As they needed money of the Allied Forces for illegal purposes they bought against the laws and at illegal prices, ranging from 300 to 400 lire for $1 and 13,000 lire for a sterling pound The black market now pays 250 lire for $1 and 5,500 lire for a sterling pound (gold) These lowering values may signify an improvement of economic conditions in Italy

American drugs are now more scanty than during the occupation of the Allied Forces Several pharmaceutic institutions are beginning to prepare Italian drugs to be put on the market soon During allied occupation drugs were provided to hospitals, university clinics and pharmacies of large cities Later the supply to pharmacies was stopped, and hospitals and clinics received minimal drug supplies At this time the black market in drugs grew For instance, hospitals and clinics for the poor obtained a bottle with 100,000 units of penicillin for 500 lire, whereas private patients paid from 5,000 to 8,000 lire through

the black market for the same amount. In Milan and Turin a bottle of 100,000 units of penicillin purchased through the black market cost 12 000 lire a few months ago, whereas now it costs about 6,000 lire (200,000 units of penicillin costs 8,000 lire)

Insulin was another substance exploited by the black market Insulin is supplied in necessary amounts for clinical use in diabetic clinics of the universities A bottle containing 200 units of American insulin may be obtained in these centers for 60 lire. When these centers are short of insulin, the black market price varies from 300 to 1,000 lire.

Tablets of multiple vitamins formerly were sold at 1,000 lire per bottle of 100 tablets A flask of thiamine hydrochloride solution containing 50 mg of vitamin B now costs 500 lire

National production of liver extracts fulfils the needs of the people Italians recently learned of the great therapeutic value of folic acid from the article by Dr Spies which appeared in the February 16 issue of the *Lancet* It will be available in Italy in the near future.

Synthetic hormones are widely used in Italy Twenty-five mg of testosterone propionate from America costs 500 lire through the black market Hormones, especially synthetic hormones of any class, should be imported to Italy, because national centers are not as yet prepared to carry on complete work in this field because of the conditions created by war The vitamins most needed in Italy are E, K and vitamins of the B group (especially pyridoxine) The following have not been used as yet in Italy extracts from fresh spleen for therapy of cutaneous allergy, thiouracil, radioactive phosphorus and Bogomolets' antirheumatic serum Experimental researches recently started in some Italian serotherapeutic institutions in which inoculation of horses by means of extracts of human organs is in progress

Pentothal, at first received without confidence is now very much liked The price through the black market (the only available place to obtain it) is 1,000 lire per flask.

### Penicillin

The Societa italiana di biologia sperimentale recently held a meeting to discuss penicillin Dr Davoli reported results of work on the effects of penicillin on bacteria Concentrated penicillin (Gerger's method) has a bacteriostatic effect on *Escherichia coli Eberthella typhosa, Salmonella paratyphi* A, Salmonella paratyphi B, Proteus OX19, Bacterium shigae, Vibrio cholerae, Brucella paramelitensis and Brucella paraabortus The bacteriostatic effect clearly shows in the culture plates of agar-bacteria by the inhibition of the growth The rate of action of penicillin is more clearly defined on Staphylococcus pyogenes than on Bacillus anthracis, Bacillus subtilis and Corynebacterium diphtheriae The effect of Penicillium notatum in the Czapek-Dox culture medium (without corn syrup) on B shigae and Proteus (gram negative bacteria) appears earlier than in those of Staphylococcus pyogenes in the same cultures However, the effect remains unchanged in the former, whereas it increases to high values in the latter In cultures of the fungus in a decoction of "alpha alpha" medical herb medium the effect of penicillin on Staphylococcus pyogenes appears earlier than on either B shigae or Proteus

Drs A Pardi and G Calamari reported negative results from the use of yellow penicillin on carriers of diphtheria. The therapy consisted in local application of the substance or else vaporizations with a penicillin solution containing from 2 to 10 Oxford units for each cubic centimeter of the solvent The treatment began shortly after disappearance of the local symptoms lasted for a long time and failed.

### Reestablishment of Mail for Medical Journals

Mailing of medical and scientific journals to Italy has been reestablished. Italian physicians received all the four January 1946 issues of THE JOURNAL early in February

### Medical Journals

*Il Policlinico, Riforma Medica* and several other medical journals which were discontinued during the war have reappeared since the beginning of the year They are published under auspices of the presidents of the Faculties of Medicine of Bologna, Naples, Milan, Pavia and Rome

## MEXICO CITY

*(From Our Regular Correspondent)*

April 13 1946

### Health Center and Tropical Medicine Training Station in Boca del Rio

On the immediate outskirts of the village of Boca del Rio in the state of Veracruz in full tropical country, a special field station of the School of Public Health and Hygiene and of the Institute of Tropical Diseases was built and equipped by the Direccion de Cooperación Interamericana de Salubridad (Office of Inter-American Cooperation in Public Health) supported by the Institute of Inter-American Affairs in Washington, D C, and the Secretaria de Salubridad y Asistencia in Mexico City The president of Mexico, accompanied by ministers and many distinguished guests, dedicated the building on February 21 Dr Pilar Hernández Lira, M P H, was appointed director of the center and station and Drs E Harold Hinman and Gustavo Baz were in charge of the addresses

The structure, which is C shaped, is located on a small beach about 7 miles from the city of Veracruz The building provides three types of activities (1) a full time health service for the inhabitants of Boca del Rio and surrounding villages and farms, (2) a center for research and study of tropical ailments and problems of warm climate and (3) an institution for the training of personnel in tropical medicine and in rural public health and welfare

Hospital space for 12 beds is available along with one student laboratory and two small fully equipped research laboratories A dental unit, outpatient clinic, pharmacy and offices are situated on the first floor of the building Dormitory space on the second floor will accommodate twenty physicians, who may attend the station either for research or as students Dining rooms, kitchen, laundry and other facilities are available. A working library, an animal house and a small serpentarium complete this field health station and research center, which undoubtedly will attract quite a number of investigators and students from all the Americas

### Resignation of Dr Manuel Martinez Baez, Undersecretary of Public Health and Welfare

Dr Manuel Martinez Baez, former director of the Institute of Public Health and Hygiene and professor of parasitology in the National University and the School of Public Health and Hygiene in Mexico resigned, February 28, as undersecretary of public health and welfare to assume a new position as special representative of Mexico in the U N O Section of Education, Culture and Science. Before his departure he was awarded the Dr Eduardo Liceaga medal for distinguished and meritorious services in the field of public health, especially of international character He has represented Mexico in several meetings and he is still an officer of the Pan American Sanitary Bureau Dr Baez was replaced by Dr Octavio S Mondragon, formerly "official mayor" in the Federal Department of Health and Welfare and private physician to President Avila Camacho

### Scientific Meetings for 1946 in Mexico

The Mexican Society of Hygiene, of which Dr Angel de la Garza Brito is president and Dr Manuel Marquez Escobedo executive secretary, is planning to meet during the third week of August. The election of new officers for the governing council and sections of the society will take place along with scientific sessions

The first National Congress on Public Health and Welfare will be held in Mexico City during the last week of August. The Institute of National Assemblies of Surgeons and the Mexican Society of Anesthetists will hold jointly the seventh meeting of the institute and the first National Congress on Anesthesiology to commemorate the discovery of anesthesia

### Inauguration of New Hospital in Veracruz by Mexican Red Cross

Gen Manuel Avila Camacho, constitutional president of Mexico, his wife and Mr Alejandro Quijano, LL D, President of the Red Cross chapter in Mexico, presided at the inauguration of a 50 bed emergency hospital and old age home in Veracruz The hospital was built with private funds and government help and cooperation In the same grounds a maternity clinic will be built to fill the urgent needs of the city of Veracruz

### Dr Salvador Zubiran Appointed Dean of the National University of Mexico

On the resignation of Mr Genaro Fernandez Macgregor, LL D, February 22, the Council of the National University of Mexico appointed Dr Salvador Zubiran as dean Dr Ignacio Gonzalez Guzman, hematologist, resigned as dean of the Faculty of Medicine and was replaced by Dr Salvador Gonzalez Herrejon, chief of the campaign against malaria in the Secretaria of Public Health and Welfare.

## BRAZIL

RIO DE JANEIRO April 22 1946

### Influence of Digitalis on Blood Clotting

Drs Luis V Decourt and Ennio C. Barbato of the Department of Clinical Medicine of the University of São Paulo have reported their investigations on the influence of digitalis on the blood clotting time They wished to ascertain the exact thromboplastic action of digitalis Three groups were observed, the first, 16 cardiac patients with different functional capacities who received digitalis in therapeutic doses the second, 16 normal persons, who received during three days 9 cat units of digitalis (3 units a day) the third, 4 cardiac patients treated without the use of digitalis (rest in bed, therapeutic dehydration and adequate diet) The determination of the blood clotting time has been done by the method of Lee-White. Determinations were made before the use of digitalis and then every fourth day during the time the drug was being administered to the patients

In 15 of 16 cardiac patients of the first group the clotting time showed a definite reduction the average time of seven minutes and twenty seven seconds (minimum four minutes, maximum eleven minutes), was reduced to five minutes and thirty seconds (minimum three and one-half minutes, maximum eight minutes) No relation was found between the degree of reduction of clotting time and the functional capacity of the heart or venous pressure. The reduction of the clotting time was present only during the use of digitalis and reverted to its previous value after the drug was discontinued. Comparable results were obtained in the second group of 16 normal persons The third group of 4 cardiac patients who did not receive digitalis showed no change in the clotting time, in spite of rest dehydration and reduction in the venous pressure.

The authors believe that the results strongly suggest a reduction of the blood clotting time with the use of digitalis with possible significance as to embolism and thrombosis in cardiac patients Although these accidents may occur in patients who are not taking digitalis, the results of the experimentation suggest a more careful use of the drug

### Complement in Weil's Disease

Dr Santos has isolated several samples of Leptospira, which have been inoculated into guinea pigs These animals contracted Weil's disease with jaundice, severe hemorrhagic syndrome and the presence of leptospiras with an increasing severity and death after eight or nine days Assay of complement, several times during the illness, disclosed the maintenance of its titer with very small fluctuations Since in Weil s disease the liver does not present the destructive process characteristic of yellow fever and tetrachloride poisoning, the findings of Dr Santos confirm Dr Costa Cruz's explanation of the decrease of the complement in yellow fever

### Brief Items

Dr Eugene R Kellersberger of the American Legion to the Leprous arrived at Rio de Janeiro a few days ago to visit some institutions connected with the work against leprosy Accompanied by Dr Ernani Agricola, director of the Division of Leprosy of the National Department of Health and by Dr H Souza Araujo of the Oswaldo Cruz Institute, Dr Kellersberger visited the Santa Fé Colony for the Leprous at Tres Corações, state of Minas Gerais

Dr Aurelio Monteiro has been appointed assistant professor of gynecology at the University of Rio de Janeiro Dr Monteiro spent some time in the United States at the Sloane Hospital for Women and at the department of gynecology of Columbia University

The fifth Brazilian Congress of Ophthalmology will be held at Salvador, state of Bahia, on June 26-30 Several ophthalmologists of Argentina Uruguay, the United States and Great Britain have been given special invitations to the meeting

### Personal

Dr Humberto C Ferreira, of the Department of Microbiology and Immunology of the University of São Paulo has gone to the United States as a fellow of the Institute of International Education to make advanced studies with Dr A S Wiener on the Rh factor

# Correspondence

## CORONARY OCCLUSION AND MYOCARDIAL INFARCTION

*To the Editor* —In commenting on various discussions by Blumgart, Master, Boas and others, Dr. Victor Jacobsen (THE JOURNAL, February 23, p. 530) mentions the need for more precise use of the terms coronary occlusion, coronary thrombosis and myocardial infarction. Such clarification is necessary. However, his communication is not always clear in its meaning; furthermore, it contains several unwarranted criticisms.

Dr. Jacobsen states that intra-atheromatous hemorrhage has rarely impressed him as sufficient to produce complete arterial occlusion. The occurrence of simple hemorrhages in arteriosclerotic plaques is well known to pathologists. The significance of such intimal hemorrhages is that they often lead to thrombosis within the lumen of the coronary artery (Paterson, J. C.: Capillary Rupture with Intimal Hemorrhage as a Causative Factor in Coronary Thrombosis, *Arch. Path.* **25**: 474 [April] 1938). Occasionally a relatively massive hemorrhage occurs within a soft atheromatous plaque and may completely obstruct the coronary lumen by pressure alone without the development of a thrombus, as was demonstrated by Wartman (Occlusion of the Coronary Arteries by Hemorrhage into their Walls, *Am. Heart J.* **15**: 459 [April] 1938). In fact, Horn and Finkelstein noted such a mechanism to have been operative thirteen times in 100 hearts showing acute occlusions (Arteriosclerosis of the Coronary Arteries and the Mechanism of their Occlusion, *Am. Heart J.* **19**: 655 [June] 1940). In addition, they found that directly or indirectly intra-atheromatous hemorrhage was the underlying mechanism in acute coronary occlusion in nearly two thirds of the cases which they examined. Hence Dr. Jacobsen's belief that intra-atheromatous hemorrhage is unimportant is not substantiated by recent investigations.

In view of these considerations, namely that obstruction of the coronary lumen may result from thrombosis secondary to intimal hemorrhage or from thrombosis without evident hemorrhage, which is much less frequent, or finally from an intimal hematoma without any associated thrombosis, the clinician should employ preferably the phrase 'acute coronary occlusion' instead of "coronary thrombosis." The differentiation is obviously a pathologic one and depends on histologic evaluation.

Dr. Jacobsen raises three points in support of the contention that effort may induce acute coronary occlusion. It is felt that all of these are open to question. First, he assumes that sudden hemorrhage into an atheroma results from the systolic rise of blood pressure during severe effort. This is entirely supposition and has not yet been proved. On the contrary, intimal hemorrhages have been known to occur in sclerotic plaques in the pulmonary arterial tree where the pressure is far lower than that in the greater circulation (Paterson, J. C.: Capillary Rupture with Intimal Hemorrhage as a Cause of Pulmonary Thrombosis, *Am. Heart J.* **18**: 451 [Oct.] 1939). His second point is that during exertion a partially occluding thrombus may be torn loose and forced distally to occlude the lumen completely. Such a mechanism is perhaps anatomically conceivable. However, if this were so it would be a common observation at necropsy to find such a dislodged thrombus wedged in a normal segment of vessel, i. e. a segment distal to the plaque from which the thrombus originated. Except for rare embolization of a coronary artery as in subacute bacterial endocarditis for example, the site of an acute coronary occlusion is always the seat of arteriosclerotic change. Occlusive lesions of the coronary arteries are best demonstrated, for routine purposes, by multiple transverse sectioning. Under this method, a dislodged thrombus was not encountered by Horn and Finkelstein in even a single instance. The same is true of other large series of similar cases in the literature.

A final argument used by Dr. Jacobsen appears to be that, since rest and not exertion is the basic component of cardiac therapy, physical effort may produce a "fresh coronary thrombosis." This is faulty reasoning. No one will deny that rest is indicated following an acute coronary occlusion, but how does that prove that exertion can produce an acute occlusion?

Master, in writing of the incidence of acute coronary occlusion, stated that the latter was the end result of arteriosclerosis and also declared that an acute occlusion may occur at any time —during sleep, rest or mild or usual activity. These statements appear "contradictory" to Dr. Jacobsen, but it is his own confusion in terminology which causes the difficulty. It is essential that the slow, progressive arteriosclerotic narrowing of a coronary vessel be sharply distinguished from the acute occlusion. Apparently Dr. Jacobsen is referring to the former, whereas Master speaks of the acute episode.

This is the moment to reemphasize the necessity for employing suitable descriptive adjectives to qualify the expression "coronary occlusion." An acute coronary occlusion will then describe a sudden closure, a rapidly occurring accident during the development of an arteriosclerotic plaque, whether it is on the basis of thrombosis secondary to intimal hemorrhage, or thrombosis alone or of intramural hematoma.

LEONARD E. FIELD, M.D., New York.

# Bureau of Legal Medicine and Legislation

## MEDICOLEGAL ABSTRACTS

**Friedman Test for Pregnancy: Factors Affecting Reliability** —The defendant was charged with murder by abortion and convicted of second degree murder, from which conviction he appealed to the Supreme Court of Colorado.

The deceased, suspecting that she was pregnant, called on a Dr. Holt and requested an examination. He gave her a bottle and asked her to return the next day with a sample of her urine. She returned as directed and presented what Dr. Holt assumed was a sample of her urine, though he had no actual knowledge of that fact. This sample the doctor delivered to a laboratory technician employed by a Dr. Halley to make the Friedman modification of the Zondek-Aschheim test. This test is performed by injecting a quantity of urine of a woman suspected of being pregnant into the blood stream of a virgin female rabbit which has been kept away from proximity to a male rabbit, is from 4 months to 17 weeks old and weighs about 4 pounds. Forty-eight hours after such injection the rabbit is killed and its ovaries are examined. If the woman is pregnant, certain changes in the appearance of the rabbit's ovaries ordinarily occur, discernible to one skilled in making such tests. If the woman is not pregnant ordinarily no change is produced in the appearance of the ovaries. This test was made and Dr. Halley reported that the result was positive. According to the medical testimony the test is correct in 90 per cent of the cases. Neither Dr. Holt nor any other witness stated definitely that the sample of urine presented to him was that of the deceased. His testimony was that she presented it to him as such. Neither Dr. Halley, his technician nor any other witness was able to state positively that the rabbit used for the test was of the age or weight required, that it was a virgin rabbit and, if so, that it had not been in proximity to a male rabbit. It was admitted that if the rabbit was not a virgin, or if so and it had been in proximity to a male its ovaries would have the appearance noted and that the test would be positive, even if deceased was not

pregnant It was further admitted that if deceased had a certain kind of tumor the test would be positive even though pregnancy did not exist, and that many other physical conditions of the woman might destroy its accuracy as a test There was no testimony that deceased was not afflicted with such a tumor, nor testimony excluding any other possible conditions that might make the test inaccurate.

Proof that there was an abortion said the court, requires as a prerequisite proof of pregnancy The evidence shows that on this point it might be questioned whether the proof is such as to justify the conclusion that pregnancy existed beyond a reasonable doubt The proof of this fact depends wholly on the so-called rabbit test, continued the court, which admittedly is accurate in only 90 per cent of the cases where it is made. No expert medical testimony is pointed out to us and we find none to the effect that pregnancy existed For this and other reasons, the judgment of conviction was reversed—*Cobianchi v People, 141 P (2d) 688 (Colo, 1943)*

**Hospitals, in General Exemption of Public Hospitals from Personal Property Taxes**—The state sought to recover personal property taxes for the years 1942 and 1943 alleged to be due from the defendant, Academy of Our Lady of Lourdes, by virtue of its ownership and operation of the St Mary's Hospital, Rochester, Minn. From a judgment in favor of the defendant the state appealed to the Supreme Court of Minnesota.

The defendant was incorporated under the provisions of the general statutes of 1878 for the purpose of establishing and maintaining hospitals, schools and institutions for orphans and the aged. It has no capital stock and none of its income, property or assets can inure to the benefit of its members the Sisters of Saint Francis of the Third Order Regular Carrying out its purposes, the defendant erected the first buildings of the St Mary s Hospital in 1889 at a cost of slightly over twenty-three thousand dollars In 1942 the total assets over and above liabilities of the St. Mary's Hospital was more than seven and one half million dollars Its net operative income in 1942 was $546 817 04 It had 890 beds, thirteen operating rooms a nurses' home swimming pool, auditorium, recreation hall, various areas set aside for educational work in connection with the care of patients and research along certain lines for the benefit of patients and a number of pathology laboratories used and staffed by the Mayo Clinic but maintained by the hospital The ultimate object of the latter service is to find new and better ways of treating patients Neither the clinic nor the hospital receives any pecuniary profit from the clinical research The Mayo Clinic contributes the equipment used, but the hospital owns it. Patients who submit themselves for examination and treatment in that part of the hospital devoted to clinical research are non-paying patients The service is contributed to medical education with the hope that the patient will also benefit. The results of this research are available to the entire medical profession The hospital has 400 student nurses, and during the years 1920 to 1944 inclusive it had 65,365 physicians from all parts of the world registered at the surgical clinics

At the outset the Supreme Court pointed out that under its prior decisions a public hospital need not operate at a loss nor as a charitable institution, to remain eligible for exemption from taxation under the constitutional and statutory provisions of the state. We are inclined to the view, the court continued, that it was intended that a public hospital should be operated for the benefit of the public in contradistinction to being operated for the benefit of a private individual corporation or group of individuals So construed, "operated for the benefit of the public' means operated without an intent to make a private profit. It is not thereby meant that the institution must dispense charity or that it may not charge a fee for services rendered. Article 9, section 1, of the Minnesota constitution exempts public hospitals from taxation The defendant also owns and operates three other hospitals, a college, a School of Musical Art and a parochial school located in different parts of the country If each of its activities was separately incorporated under a corporate structure such as the defendant, the property of each would be tax exempt. It would seem, the court concluded, that the mere fact that all the activities are carried out under one corporation, all within one legal entity, cannot possibly make the property or proceeds of any of them taxable.

The plaintiff contends that, since the admitted chief support of all the activities of the defendant comes from the income from St Mary's Hospital, profits from the operation of the hospital are intended, and, since they result, that it is not a public hospital and therefore not tax exempt. The complaint seems to be that there is a surplus Of course, it was the intention to operate the hospital so as to create a profit and avoid a deficit There was no intention however to make a private profit and none has been made The fact that the hospital has been successfully operated cannot, of course, be the feature which makes it legally an institution subject to tax or, if unsuccessfully operated, tax exempt. Its close cooperation with the Mayo Clinic, the most distinguished institution of its kind, together with its own competent administration accounts for its astounding growth From its income it has enlarged its plant to the proportions we have indicated The sisters contribute their services to the hospital Such services are characterized by arduous work and long hours for which they receive no pay They do receive training room, board, clothing, medical and hospital care, and support in old age and are provided a decent burial It was estimated by a witness competent to testify that the cash value of the services rendered by the sisters to St Mary s Hospital during the years 1919 to 1942 inclusive would be almost three million dollars on a minimum salary evaluation, less the value of certain things which they receive. Neither the hospital s property nor profits can ever inure to the benefit of any private individual or group of individuals

In its organization and operation, St Mary s Hospital is, the court concluded clearly a public hospital and as such its property is exempt from taxation Accordingly the judgments of the trial court in favor of the defendant were affirmed—*State v Academy of Our Lady of Lourdes, 21 N W (2d) 617 (Minn, 1946)*

# Current Medical Literature

## AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1936 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied with stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

**211** 129-256 (Feb.) 1946

Meningococcus Myocarditis. Report of 2 Cases with Anatomic and Clinical Characteristics. D. V. Holman and D. M. Angevine.—p. 129
Spontaneous Pneumothorax in Healthy Young Adults with Particular Reference to Etiologic Role of Aerial Ascent. E. M. Heath.—p. 138
Why Certified Milk? J. H. Brown.—p. 144
*Amino Acids in Production of Plasma Protein and Nitrogen Balance. S. C. Madden and G. H. Whipple.—p. 149
*Effect of Salicylate Therapy on Weltmann Serum Coagulation Reaction and Its Use as Prognostic Test in Rheumatic Fever. D. E. Ward Jr. and G. T. Harrell.—p. 157
Psittacosis Treated with Sulfonamide Drugs. J. A. Toomey and R. C. Lohrey.—p. 163
Thrombophlebitis with Multiple Pulmonary Emboli. Psychiatric Self Observations. F. Wertham.—p. 166
Thiouracil Effect in Diabetes Mellitus Complicated by Hyperthyroidism. W. S. Reveno.—p. 174
Influence of Environmental Temperature and Relative Humidity on Rate of Water Loss Through Skin in Congestive Heart Failure in Subtropical Climate. G. E. Burch.—p. 181
Respiratory Quotient and Blood Pyruvate and Lactate Responses After Oral Ingestion of Glucose and Fructose in Diabetes Mellitus With and Without Insulin. H. F. Root, E. Stotz and T. M. Carpenter.—p. 189
Human Utilization of Biotin from Various Diets. Josephine Gardner, Helen T. Parsons and W. H. Peterson.—p. 198
Chloroma. Clinicopathologic Study of 2 Cases. E. G. Goodman and L. Iverson.—p. 205
Natural Course of Chronic Southwest Pacific Malaria. W. L. Noe Jr., C. C. Greene Jr. and G. Cheney.—p. 215
Electrocardiographic Evidence of Cardiac Complications in Infectious Mononucleosis. W. F. Evans and A. Graybiel.—p. 220
Treatment of Human Hypertension with Kidney Extract. C. D. Stevens, J. H. Kotte, C. C. Smith and J. McGuire.—p. 227
Review of Present Concepts on Fluid Balance. W. E. Abbott.—p. 232
Retinal Lesions in Acute Disseminate Lupus Erythematosus. H. P. Wagener.—p. 240

**Amino Acids in Production of Plasma Protein and Nitrogen Balance.**—Madden and Whipple used pure crystalline amino acids in various mixtures, parenterally or by mouth to study plasma protein production and nitrogen balance in dogs and in man. Amino acids can supply the protein nitrogen requirements of the body. The so-called ten essential amino acids in suitable amounts can be given by mouth, by vein, subcutaneously or intraperitoneally with equal success in maintaining nitrogen and weight equilibrium. These ten essential amino acids are threonine, valine, leucine, isoleucine, lysine, tryptophan, phenylalanine, methionine, histidine and arginine. Aminoacetic acid (glycine) is usually added to this mixture. By mouth the amino acids are utilized a little more completely than when given parenterally. Experiments give no evidence that the unnatural isomers of the amino acids are toxic and some are probably used in the body. These amino acid mixtures can be given rapidly in 10 per cent solution parenterally and cause less clinical disturbance than any protein digests so far tested. Glutamic acid in digests or amino acid mixtures is not well tolerated by vein and may induce vomiting. Abundant production of plasma proteins in standardized dogs is readily demonstrated as being due to these amino acids as the sole source of nitrogen. The production of new plasma protein due to amino acids in general corresponds favorably with the response to high grade diet protein in equivalent amounts. The amino acid mixtures are well utilized by patients with chronic infection (colitis), gastrointestinal disturbances (partial obstruction) or cancer cachexia.

**Effect of Salicylate Therapy on Weltmann Serum Coagulation Reaction.**—Ward and Harrell made serial studies for six months of the Weltmann coagulation reaction, sedimentation rate and leukocyte count of 26 patients with rheumatic states who were receiving salicylate therapy. The Weltmann coagulation reaction was unaltered in vitro or in vivo by levels of salicylates commonly attained in the blood. Even in the presence of salicylate therapy a low Weltmann coagulation band, an elevated sedimentation rate and an elevated white blood cell count are all indications of an inflammatory process. The coagulation band is least affected by extraneous factors, however, and gives the most uniform results. The Weltmann coagulation band agreed more closely with the clinical course and symptoms in patients studied than did the sedimentation rate or white blood cell count. The Weltmann coagulation reaction seems to be a better measure of activity and a more accurate index to the prognosis of rheumatic fever in patients receiving salicylate therapy than other laboratory aids now available.

**Dynamics of Action of Penicillin**—Jawetz reports investigations on the effects of penicillin in white Swiss mice which were infected with a virulent beta hemolytic streptococcus strain that had been isolated from a patient with sore throat He found that the success of penicillin by parenteral injection against an otherwise fatal infection of mice depended on both the quantity of penicillin administered and the interval between injections Small doses of the drug had to be given frequently (every four hours) in order to save a significant portion of infected animals but if large doses were used injections could safely be spaced eight to ten hours apart with excellent results With large doses a single injection sufficed to save a majority of animals By means of several bacteriologic methods it was demonstrated that the effects of penicillin on the bacterial population in the host lasted much longer than the measurable blood levels

*Intraocular Penetration of Streptomycin Following Systemic and Local Administration I H Leopold and Anne Nichols—p 33
*Congenital Cataract and Other Anomalies Following Rubella in Mother During Pregnancy California Survey J J Prendergast—p 39
Ocular Imagery A Cowan—p 42
Ocular Complications of Malaria W M Grant—p 48

**Genetics of Glioma of Retina and Brain**—Rados reports the occurrence of glioma duplex of the same histologic type in a boy and a girl whose mothers were sisters. The boy had a neuroepithelioma and the girl an astrocytoma of the brain. The occurrence of malignant growths of the same type in the retina and in the brain in collateral lines is presented for the first time.

**Intraocular Penetration of Streptomycin.**—Leopold and Nichols state that a single intravenous or intramuscular injection of 10,000 units of streptomycin per kilogram of body weight produced detectable concentrations of streptomycin in the conjunctiva, sclera, extraocular muscles and aqueous humor of the normal rabbit eye The concentrations in these tissues were increased by raising the systemic dose to 100 000 units per kilogram of body weight With the larger systemic dose streptomycin also appeared in the cornea vitreous, chorioretinal tissue and optic nerve of the normal rabbit eye. Concentrations of streptomycin in secondary aqueous humor were greatly increased over those in primary aqueous humor after systemically administered streptomycin. Local administration in drop form of a solution of streptomycin containing either 5 000 or 50 000 units per cubic centimeter of isotonic solution of sodium chloride or of an ointment containing 5 000 units per gram of base failed to penetrate readily into the aqueous humor of the rabbit eye with a normal cornea However both the solution and the ointment penetrated readily into the aqueous humor of the rabbit eye with a partially abraded cornea. High concentrations of streptomycin were obtained in the aqueous humor of normal rabbit eyes after iontophoresis with a solution of streptomycin containing 5 000 units per cubic centimeter of isotonic solution of sodium chloride for three minutes

**Congenital Anomalies After Rubella.**—In the fall of 1944 a survey was made of reports by 37 ophthalmologists, 24 pediatricians and 32 obstetricians in California on the incidence of congenital anomalies among children in that state whose mothers had had rubella during the first three months of pregnancy Eighty cases of congenital cataract and 10 cases of other ocular defects 32 cases of cardiac defects and 10 cases of other congenital anomalies were reported Because the greater number of cases to date have been reported from the western part of the United States the query is raised whether such congenital defects are more prevalent in this part of the country or whether the condition has spread to the Pacific coast from Australia, where it was first reported and is now progressing across the country

**Frog Test for Diagnosis of Pregnancy.**—The South African clawed frog, Xenopus laevis, has been used as a test animal for several years and is rapidly replacing the rabbit in the diagnosis of pregnancy. After trying several methods of urinary hormone concentration, Oliver and Miller found that a modification of Scott's method was superior to all others in accuracy, ease of preparation of the reagents and the fact that concentrates so prepared were less toxic to the animals. This method is also more rapid because it is not necessary to dry the precipitates of volatile solutions such as are employed in other concentration methods. In over 300 tests they obtained an accuracy of 99.2 per cent without the loss of a single test animal due to faulty technic or toxicity of the concentrate. They found that 2 frogs must be used in order to obtain a high percentage of accuracy. By using 2 test animals for each specimen submitted, one can readily check on the animals giving false negative tests. These animals should be rested for at least two months, kept well nourished and thus be returned to a state of good health, when they will give reliable results. This technic is relatively simple, time saving and highly accurate. This modification has the advantage of speed over other tests.

**Relation of Ascorbic Acid Intake to Gingivitis.**—Linghorne and his associates say that examination of service personnel and apparently healthy young civilians in Canada has revealed that inflammatory changes in gingival tissue are of frequent occurrence. Surveys of 1,448 apparently normal air force personnel under 30 years of age, including civilians on entry as well as persons who had been in service for several months, showed that approximately 20 per cent had gingivitis, usually asymptomatic, of a degree which could be readily detected by superficial examination of the oral cavity. Studies were conducted on air force personnel to investigate the effects of various nutrients on the incidence of gingivitis. The first study demonstrated that the administration of large amounts of vitamins A and D, thiamine, riboflavin, nicotinic acid and ascorbic acid for a period of five months had no clinical effect on preexisting inflammation of the gingivae. The second study indicated and the third study confirmed that when gingivitis was cleared to a maximum degree by local treatment 75 mg. of ascorbic acid daily delayed recurrence more than 10 mg. of ascorbic acid daily. A diet containing 75 mg. of ascorbic acid retarded recurrence to a greater degree than 25 mg. of ascorbic acid daily. There was no significant difference between the effect of a diet containing 10 mg. of ascorbic acid and one containing 25 mg. of ascorbic acid. The retarding effect on recurrence of gingivitis of a diet containing 75 mg. of ascorbic acid was not significantly different from that of a diet containing 10 mg. of ascorbic acid plus 70 mg. of ascorbic acid in tablet form. The microscopic appearance of the gingival tissues encountered in these studies in no way resembled the changes seen in scurvy.

**Dupuytren's Contracture.**—Ayre found 64 cases of Dupuytren's contracture among 486 members of the Veterans' Guard of Canada. This is an unusually high incidence. In all but 2 cases the contracture had begun while the men were on active service, which suggested that something peculiar to military service may have predisposed to its development. However it was impossible to demonstrate a definite etiologic factor in this group. The author is inclined to agree with Dupuytren's opinion that trauma is primarily involved, thinking that the contracture results from trauma in persons with a certain predisposition. Of the 64 cases observed by the author 34 were early, 25 moderately advanced and 2 complete. The thumb was involved in 1 case. In 1 other there was fibrous induration of the penis. During civilian life most of the group have been manual workers and during four years' army service they have been engaged in daily guard duties handling a rifle during a large part of the day.

Some Phenomena of Group Psychotherapy H A Rashkis —p 187

**Neostigmine in Spastic Paralysis from Cerebral Lesions**—Kabat and Jones review the results obtained with neostigmine in 32 cases of chronic spastic paralysis or related conditions from cerebral lesions Intramuscular injections were given six times a week. The dosage varied from neostigmine methylsulfate 1 cc. of 1 2,000 solution (0 5 mg) with atropine sulfate 1/200 grain (0 32 mg) to neostigmine methylsulfate 3 cc. of 1 2 000 solution (1 5 mg) with atropine sulfate 1/100 grain (0 65 mg) In a few cases neostigmine bromide was given orally to supplement the injections in a dosage of from 15 mg three times a day to 45 mg of neostigmine bromide with atropine sulfate 1/150 grain (0 5 mg) three times a day Neostigmine was administered after meals to diminish toxic effects It has been administered to 11 patients who had developed hemiplegia from one to thirty-one years before. Improvement was observed in all and was retained after therapy was discontinued Eight patients who had had hemiplegia for months were treated with neostigmine, and accelerated recovery of motor function was observed in some. Of 6 patients with the spastic type of cerebral palsy who were given neostigmine 3 children all showed significant improvement while of 3 adults only 1 showed slight improvement. Three patients with the athetoid type of cerebral palsy all showed significant improvement from neostigmine therapy Two children with mild ataxia, 1 of whom had cerebral palsy with severe stuttering and the other of whom had had a subarachnoid hemorrhage at the age of 1½ years improved greatly on neostigmine Definite improvement from neostigmine occurred in ataxia and facial paralysis in a patient who had had an acoustic neuroma removed more than three years before Moderate improvement was observed in a disability of the upper extremity in a patient who had had a prolapsed cervical disk removed One patient with pseudohypertrophic muscular dystrophy derived no benefit from neostigmine Three patients with lesions of the spinal cord obtained slight or no improvement Neostigmine decreases spasticity, thereby decreasing resistance to passive motion increasing range of joint motion, relieving muscular pain and decreasing deformity It facilitates voluntary motion, resulting in restoration of motions which had long been absent, increasing strength, improving coordination and diminishing fatigue In addition neostigmine has resulted in improvement in athetosis ataxia dysphagia, dysarthria facial paralysis, motor aphasia and conscious proprioception from a variety of types of lesions of the brain Improvement has been retained after therapy was discontinued For maximal functional recovery neostigmine therapy should be accompanied by exercise and muscle training Evidence is presented that the locus of the therapeutic action of neostigmine in these cases is on the central nervous system.

**Histamine Therapy in Multiple Sclerosis**—Carter studied the effect of histamine therapy in 20 cases of multiple sclerosis The technic of Horton (1944) was used, 2 75 mg of histamine diphosphate in 250 cc of isotonic solution of sodium chloride being given intravenously at 30 to 90 drops per minute Seventeen cases failed to show improvement Three cases showed temporary improvement of less than six months followed by relapse

**Nutritive Value of Fish Proteins**—Deuel and his associates studied the biologic value of proteins of mackerel, sardine and tuna The mixed proteins of mackerel, sardine and tuna muscle were shown to afford growth superior to casein in weanling rats when fed at levels suboptimal for growth with casein. The superiority of mackerel protein is further attested by the fact that it causes greater recovery in weight and a more pronounced stimulation in hemoglobin regeneration than casein in rats rendered hypoproteinemic and tested by the method of Cannon. Mackerel protein proved to have a potency equal to casein in causing a regeneration of plasma protein

**Fat and Food Utilization.**—Forbes and his associates conducted a seventy day metabolism and body analysis experiment to determine the effects of differences in the fat content of isocaloric diets on the utilization of food energy and protein The subjects were four groups of 10 growing male albino rats, each of these four groups containing 1 rat from each of the same ten litters A comparison was made of four diets containing 2, 5, 10 and 30 per cent of fat respectively, these diets being so compounded and fed as to supply to each rat of a litter of 4 the same quantities of gross energy, protein and vitamins Determinations were made of gains in live weight, nitrogen fat and energy, with a single value of the heat production for the seventy days as the energy of the food minus

the energy of the excreta and of the body gain The gains in live weight, the digestibility of nitrogen and the retention of nitrogen and energy were in the order of the increasing fat content of the diets, the superiority of the 5 per cent over the 2 per cent fat diet with respect to the utilization of both protein and energy being much greater than the superiority of the 30 per cent as compared with the 5 per cent diet

**Single Injection of Penicillin Oil Beeswax Mixture in Gonorrhea.**—The penicillin oil beeswax mixture consists of 4 8 per cent beeswax in peanut oil in which is suspended calcium penicillin Chinn and his associates used a peanut oil mixture which contained 300,000 units of penicillin per cubic centimeter The material is solid at room temperature and must be well warmed and liquefied before use. Injections were made into the gluteal muscle with a 2½ inch needle, gage 18 or 19 One cc or a single dose of 300,000 units was administered A total of 115 cases of gonorrhea were treated. A cure rate of approximately 95 per cent was obtained Cultures were made after forty-eight hours and seven to ten days following treatment. This method appears to be a highly satisfactory procedure and suitable for both clinic and private practice The possible coexistence of syphilis should be kept in mind, and periodic serologic tests for syphilis should be made over a ninety day period.

**Hyperuricemia in Gastric Cancer**—Ficarra has studied the exogenous and endogenous protein metabolism of 20 patients with gastric cancer by serum protein and blood uric acid determinations The importance of hyperuricemia is stressed, first, because it differentiates hypoproteinemia following insufficient exogenous protein from hypoproteinemia resulting from accelerated endogenous protein metabolism Thus the source of protein depletion can be identified It is of value in predicting postoperative complications usually associated with a debilitated nutritional state in patients with gastrointestinal cancer

**Transmission of Bacteria by Postage Stamps**—Macht thinks that the licking of postage stamps suggests the possibility of transmitting infectious bacteria capable of producing disease The hazard of infection if it exists would be greatest to the philatelist. Macht found that the gum on U S postage stamps contains no germicidal properties It has slight bacteriostatic properties at least for Staphylococcus albus This organism a common inhabitant of the nose and throat can withstand drying for a long time. A growth was obtained from stamps Tubercle bacilli were not cultured from stamps licked by patients known to have active pulmonary tuberculosis Previous sputum tests of these patients showed as many as 100 tubercle bacilli to a microscopic field. Stained smears of the centrifuged sediment obtained from the back of each stamp also failed to show acid-fast bacilli All cultures for other organisms, both aerobic and anaerobic, as well as for diphtheria bacilli were negative This study would indicate that there is little danger of the common use of postage stamps playing an important part in transmitting infectious diseases.

**Vitamin C Content of Home Cooked Vegetables.**—Jenkins investigated by direct analysis the vitamin C content of samples of home cooked vegetables and the losses incurred during cooking. Information about the timing and method of cooking was obtained for most of the samples. The vitamin C content of over 300 samples of vegetables cooked in ordinary households was determined. The average results, in milligrams per hundred grams, were 10.5 for potatoes in September and 5 in April, and 13 for cabbage in September and 35 in April. Average meals containing potatoes and greens provided between 20 and 28 mg. of vitamin C according to season. Average meals containing no green vegetables provided less than 15 mg. vitamin C in September and less than 8 in April. The correlation between vitamin C values as analyzed and those calculated from information about the methods of cooking employed was poor in individual cases but the average agreed fairly well, especially with potatoes.

**Ascorbic Acid in Idiopathic Methemoglobinemia.**—Deeny recently reported the results of treatment in 2 cases of polycythemia vera with ascorbic acid. He also encountered 2 brothers with familial idiopathic methemoglobinemia who were intensely cyanosed. Ascorbic acid was given to 1 brother, and in a short time his color became normal. Barcroft and his co-workers investigated the second brother during treatment. The first brother, now aged 29, was blue from birth and the second brother, now aged 19, was blue from an early age. Physical examination showed no cause for the cyanosis. Both enjoyed normal health apart from slight dyspnea. Blood ascorbic acid was determined on whole blood by the method of Deeny, Murdock and Rogan. Methemoglobin was determined by three methods (*a*) by the difference between oxygen capacity and total pigments, (*b*) with a spectrocomparator and (*c*) by the method of Evelyn and Malloy. Methods *b* and *c* were of service when the quantity of methemoglobin in the blood became so small that determination by difference gave uncertain results. The oxalated blood of the second brother had the chocolate tint of methemoglobin, the blood changes produced by treatment with 100 mg. of ascorbic acid twice daily for sixteen days and subsequently with double the amount are summarized. The skin color recorded twice before and nine times during treatment showed a gradual disappearance of the cyanosis and its replacement by the normal reddish tint that is the cyanosis was relieved and the methemoglobin fell from 7.3 Gm. to 0.8 Gm. per hundred cubic centimeters of blood. Continued treatment with ascorbic acid (200 to 300 mg. per day) has kept the methemoglobin at a low level for nearly two years. In vitro ascorbic acid reduced methemoglobin in the patient's red cells to normal hemoglobin. The enzyme systems in the erythrocytes of the two patients reduced methemoglobin in presence of added glucose or lactate much more slowly than did those present in normal red cells.

**Role of Kidney in Acute and Chronic Hypertension.**—Pickering confirms previous observations that, when hypertension is produced in the rabbit by constricting one renal artery (the other kidney having been removed), excision of the ischemic kidney after eight days or less usually abolishes the hypertension in a few hours but that excision of ischemic kidney after seven weeks or more has no effect on the hypertension during the four day survival period. Persistence of hypertension after excision of the ischemic kidney in animals with prolonged renal ischemia is not due to inability to inactivate renin. The response to renin is increased in size and duration in normal animals by total nephrectomy. Animals with renal ischemia of short duration respond to renin after nephrectomy in the same manner as nephrectomized animals which have never had hypertension. In animals with prolonged renal ischemia the response to renin after nephrectomy is unusually great and prolonged. It is concluded that in the rabbit during the first week after renal artery constriction hypertension is due solely or chiefly to the release of a humoral agent, probably renin, from the ischemic kidney. Later a new and nonrenal factor plays an important, and perhaps the chief, role in maintaining the raised pressure.

**Penicillin in Acute Infections of Pleura.**—Fatti and his associates compared the progress and end results of two contemporaneous series of acutely infected pleural effusions: 14 cases treated by standard methods (controls) and 20 cases treated with penicillin and a surgical technic. In "treated" cases (1) toxemic manifestations disappeared at a significantly greater rate, (2) pus formation was speeded up rather than prevented, (3) retained pus, even if sterile, produced a recurrence of

pyrexia, and (4) leukocytosis steadily disappeared as the infection was controlled, but the immediate effect of treatment on leukopenia was to increase the number of white cells Red cell examinations were not a guide to progress during treatment as they are in infections producing severe anemia. The mean healing time has been reduced from fifteen to seven weeks Radiologic evidence pointed to the more rapid clearing of abnormal shadows, usually within three months Chest expansion more often returned to normal by the end of six months in the 'treated" cases Evidence that the rapid healing was permanent was that there had been no recurrence or residual signs of infection radiologic or clinical, in the affected side by the time the investigation was completed sixteen months after the last patient was treated The patients treated with penicillin were able to resume their former work considerably sooner than those treated by other methods

**Electrocardiogram Obtained Directly from Human Heart** —In patients with pneumothorax who are to be operated on for pneumolysis it is technically simple to place an electrode on different sites of the surface of the heart. When pairing this electrode with one or the other extremity of the patient the resulting electrocardiogram represents fairly accurately the potential variations occurring in the respective areas With this method Borchardt and Groedel studied the electrical recordings from the surface of the heart of a woman aged 24 with a left sided pneumothorax and a girl aged 17 with a right sided pneumothorax They found that the left and right partial electrocardiograms obtained routinely by Groedel s method leading off from the anterior and posterior chest wall to a place distant from the heart were identical with the respective curves obtained when leading directly from the surface of the left and right ventricles By comparing the voltage of the internal left and right partial electrocardiograms with that of the external electrocardiograms it was found that on the surface of the heart the voltage is more than six times that of the usual chest leads This promising new method can be modified in many ways, it requires about fifteen minutes, a short time as compared with that required for pneumolysis It never caused the patient any discomfort

**Prefrontal Lobotomy** —Barretto reports his experience with prefrontal lobotomy at the Juqueri State Hospital in São Paulo Brazil He devised a lobotome for a threefold purpose to ascertain the reference marks sever the fibers and leave iodine oil in the transection track. The instrument consists of a trocar slightly flattened to take the shape of a regular leukotome and having one of the ends sealed. In one of the severing edges near the blind end there are four small holes 1 cm apart from one another Through the free end a syringe may easily draw fluid and inject the contrast into the transection surface To secure a better placing of the transection he has recently followed the technic of transfixing the falx and both frontal poles with a stylet inserted through burr holes He also advises preoperative pneumoencephalography for the localization of the ventricles He performed prefrontal lobotomy on 42 patients but feels that the postoperative period has not been sufficiently long to permit an evaluation of the results One woman aged 25, fully recovered following lobotomy although metrazol and insulin shock and even leukotomy according to Moniz had failed The condition of all the patients subjected to lobotomy was chronic, and they had failed to respond to other treatments Serious accidents did not occur during or immediately after the lobotomy

**Allergic Dermatitis Caused by Aniline Intoxication.**—Ferrer Zanchi and Bonduel report the experience of a worker who for twenty-five years had been employed as a printer of silks He was exposed for many hours daily to the inhalation of the vapors of the aniline dyes In applying the matrix to the silk the hands were almost continuously covered with the dyes The first symptoms appeared on the skin of the hands in the form of erythema with vesicles and abundant serous secretion. The disorder was most intense between the fingers the patient being greatly annoyed by a burning sensation. The condition was diagnosed as eczema and the patient interrupted his work for fifteen days but on returning to his work the same disorder reappeared. For two months thereafter he was subjected to intense treatment. He returned to work completely cured, but at the end of a certain period the disorder recurred this time extending to the face forearms and legs the patient also had gastrointestinal disturbances gastric pains, diarrhea *nausea, weakness and severe headaches He was given a new* treatment which lasted four months but a few days after he returned to work he had another attack of dermatitis. This time the entire body became involved and he was forced to abandon his occupation as a textile printer

**Allergy to Insulin.**—Ganem presents the clinical history of a woman aged 49 who ten days after the commencement of treatment with protamine zinc insulin and soluble insulin presented generalized allergic symptoms which occurred several times daily coincident with the injection of the common form of insulin and also the crystalline form It was not possible to desensitize the patient with the crystalline form but a few days later it was found that protamine zinc insulin could be tolerated in increasing doses starting with 2 units and reaching 40 units in fifteen days It is thought that these manifestations might have been due to the slow absorption of the protamine and its gradual increase after some days

## Acta Medica Scandinavica, Helsinki

1-204 (Supplement to Vol 167) 1945

*Flexner Bacilli and Flexner Dysentery U P Kokko —p 1

**Flexner Bacilli and Flexner Dysentery** —Kokko presents a monograph on an extensive epidemic during the summer of 1944 among troops on the Carelian Isthmus Cultures of the Flexner bacillus were obtained in about 32 per cent of the examined cases Most of the positive cultures were obtained in the beginning of the illness of the specimens of feces examined during the first five days of illness, 58 per cent yielded Bacterium flexneri Positive cultures were more frequent in samples of feces preserved with 30 per cent glycerin and 0.6 per cent sodium chloride in water than in specimens sent for examination without the preserving solution. The bacillus was never found in samples of blood, urine, synovial fluid or stomach contents The Flexner bacillus remained alive in excrements for two to three days being better preserved in cold than in heat, averaging 2 5 days in an incubator at 37 C and 6.5 days in a refrigerator Different Flexner strains varied in fermentation, arabinose, maltose, saccharose, raffinose dextrin sorbite and the production of indole. This variation was shown not only between different strains but also between the subcultures from different colonies of one single strain and subsequent cultures at different times More than 15 per cent of the examined strains decomposed both maltose and saccharose producing acid, a peculiarity which is not compatible with the three principal types of the original Flexner group Serologic type characteristics with Kauffman's method were constant although some variations in the antigenic structure occurred.

**Amyloidosis Myocardii** —Ranström reports 3 cases of cardiac amyloidosis in an autopsy material of 550 cases Case 1 was that of a man aged 88 with atypical amyloidosis in the myocardium Microscopic examination revealed many small deposits of interstitial amyloid. The patient had been suffering from increasing cardiac insufficiency for years and died with symptoms of coronary insufficiency No cause of amyloidosis could be demonstrated at postmortem. Case 2 was that of a man aged 80 who presented the anatomic picture of an atypical amyloidosis located primarily in the heart Microscopic examination revealed medium sized and small myocardial arteries changed into massive amyloid clumps with strands of connective tissue. In the cardiac musculature there were small foci of interstitially deposited amyloid The left auricle contained extensive subendocardial deposits of the same material There were large quantities of amyloid in the mitral valves Clinically the case was characterized by a cardiac insufficiency slowly progressing for several years Case 3 was that of a man aged 81 who presented an atypical amyloidosis of the heart which was the only organ affected Microscopic examination revealed small foci of interstitial amyloid in the cardiac musculature Within the amyloid areas the separate muscle fibers were wholly or partly atrophied, otherwise there was muscular hypertrophy The myocardial amyloidosis was associated with signs of acute septic myocarditis in the form of abundant small interstitial foci of polymorphonuclear leukocytes.

**Tuberculin Negative Erythema Nodosum.**—Vogt reports 40 cases of erythema nodosum from the department of internal medicine of the Aker Municipal Hospital in Norway during the years 1940 to 1943 Thirty-three of these gave a positive tuberculin reaction In 6 the tuberculous origin of the condition was definite In the remaining 27 cases with a positive reaction the same etiologic factor was considered as probable. The occurrence of acute polyarthritis in 10 cases especially when associated with nephritis or with a septic course, suggests that the erythema nodosum was not caused by tuberculosis This somewhat vague concept became more concrete after the study of 7 cases in which the tuberculin reaction was negative. Five of the patients did not show signs of any specific etiology Of these 5 4 had acute polyarthritis and 1 had a sore throat and acute nephritis immediately after the eruption. The fifth had a sore throat prior to the eruption. Hilar adenitis was present in 2 of these patients, and 1 showed unilateral enlargement of the hilus The existence of a syndrome is suggested consisting of erythema nodosum acute polyarthritis and occasionally a sore throat as the provocative symptom at times associated with nephritis and not infrequently with hilar adenitis The etiologic factor may be of a 'rheumatic (streptococcic?) nature A positive tuberculin cutaneous reaction does not exclude an unspecific etiologic factor even if the hilar glands are enlarged.

# Book Notices

**Textbook of Obstetrics Designed for the Use of Students and Practitioners.** By Henricus J Stander M D F A C S Professor of Obstetrics and Gynecology Cornell University Medical College New York Stander's third revision This edition represents the ninth edition of Williams Obstetrics the first six of which were written by the late Dr J Whitridge Williams Professor of Obstetrics Johns Hopkins University School of Medicine Fabrikoid. Price $10 Pp 1,277 with 740 illustrations New York & London D Appleton-Century Company 1945

A review of an internationally famous textbook such as the textbook of obstetrics by Stander may be evaluated better by constructive criticisms than by lauding the numerous merits Its preeminence as a textbook is well established Improved visual educational methods and better use of diagrams, illustrations and properly chosen pictures enhance a good text. As is so often the instance the author has not deleted or abbreviated the text or bibliography The text proper is composed of 1,214 pages and is followed by an index of 63 pages No doubt the colored reproductions should be improved in later editions when better materials are available and there are fewer restrictions There is little justification for including vomiting of pregnancy under the section on toxemias of pregnancy There is adequate discussion of causes of abortion and considerable discussion on treatment, but the advice of digital exploration of the uterine cavity in incomplete abortion is not generally advised by other authorities The use of pack in the rigid cervix in incomplete abortion may also be as severely questioned. Sixty-three pages are assigned to clinical pelvimetry, following the older classification of pelves the morphologic classification of Caldwell and Maloy is disposed of in four and one-half pages The subject of asphyxia is appropriately emphasized, yet certain schools of thought may not agree with the visual method for clearing the trachea and for insufflation with carbon dioxide and oxygen. There are excellent illustrations on the use of Piper forceps on the aftercoming head, but the description is very brief. Although there has been an increase in the death rate from hemorrhage in recent years a greater and compensating reduction has occurred in toxemia sepsis and other causes The discussion of puerperal infection is good except that the portion on treatment seems abbreviated. There is brief reference to management of peritonitis The use of sulfonamides is reasonably well defined, but the place of antibiotics has been conspicuously omitted (Perhaps their introduction has been so recent that it was not possible to get such a section adequately and reliably prepared for this edition.) In several sections not a direct distinct single treatment outline is offered but several are discussed. The student may be inclined to feel insecure, whereas the general practitioner and the young specialist can profit by the presentation of the various methods No doubt this book was reedited under pressure of time and shortage of help Dr Stander has made considerable changes and has made a good revision. The book is practical and valuable for the student and the physician Even with the enumerated faults this volume is adequately documented practical and valuable It is sponsored by the authority and integrity of its editor The publishers and editor deserve credit for keeping this edition like the previous one in the enviable position of second to none.

**The Psychology of Seeing** By Herman F Brandt Professor of Applied Psychology and Director of the Visual Research Laboratories Drake University Des Moines Iowa Cloth Price $3 75 Pp 240 with 88 illustrations New York Philosophical Library 1945

This is a short monograph describing the author's technic and his findings The eye movements are photographed in a bidimensional plane on a single film Two small beams of light are focused on the corneas and the reflex is recorded by the camera on a film. These pictures are taken while the subject observes various pictures or printed material By means of the series of dots and lines the progress of the eyes over the text can be followed and studied As a rule the upper left area is the first observed, and more time is spent looking at that quadrant. Red attracts more attention than black and white A considerable portion of the book is given to the study of advertising layouts A comparison of eye movements of superior and poor students in solving mathematical problems shows purposeful systematic motion versus time consuming, useless duplication of movement A study of motion while reading and learning to read is presented in part 5, and study of art in part 6 The author believes that with his technic he may be able to measure the intellectual abilities of individuals, ascertain the aptitudes underlying mental and motor performance establish criteria in judging the degree of intoxication, differentiate between the abilities of poor and good gunners evaluate the adequacy or inadequacy, diagnose visual acuity in relation to the task to be performed, determine the effect of fatigue resulting from prolonged motor activity detect the guilt or innocence of a criminal and identify specific personality traits and characteristics He presents his findings to call attention to ocular photography as a scientific approach to the study of the human mind and behavior which may have far reaching effects The book presents an interesting psychologic study

**The Manual of the M. D Anderson Hospital for Cancer Research** Compiled by Members of the Staff Helen T Koniias editor M. D Anderson Hospital Publications Cloth. Pp 201 Houston University of Texas 1945.

This brochure the first publication of the sort by the M D Anderson Hospital for Cancer Research has been prepared under the auspices of the University of Texas School of Medicine. It is a concise, briefly written book which enumerates somewhat categorically, the various kinds of cancer and the methods of diagnosis and treatment. The manual is not intended as a comprehensive treatise Its purpose as indicated in its foreword, is to acquaint general practitioners who are assumed to have cursory knowledge of the cancer problem, with the newest developments in cancer The source of the material is the published experience of those surgeons radiologists and pathologists who have been intimately associated with cancer diagnosis and therapy The data and information in the contents have been augmented with the criticisms and suggestions of members of the clinical staff of the M D Anderson Hospital For a publication of this nature, the book is well organized and indexed A generous bibliography indicating where further elaboration on the various problems of diagnosis and treatment of cancer may be found is appended.

**Zur Frühdiagnose und Früherfassung maligner Oberkiefertumoren** Vorgelegt von Dr med dent. Karl Kallenberger Inaugural Dissertation zur Erlangung der Doktorwürde der Medizinischen Fakultät der Universität Basel. Paper Pp 109 Basel Benno Schwabe & Co 1944.

The thesis is based mainly on the study of 39 cases of cancer of the upper jaw treated in the clinic at the University of Basel during the years 1922-1941 The bibliography contains 132 items The histories of the cases are given in detail, with tabulation of the main facts The series includes 30 cases of carcinoma, 5 of sarcoma, 3 of melanoma and 1 of 'cylindroma The records show that in its early stages cancer of the upper jaw frequently is mistaken for dental disorder chronic maxillary sinusitis trigeminal neuralgia and dacryocystitis A principal obstacle to early diagnosis is the failure of the physician to bear in mind always the possibility of cancer in patients with symptoms of such conditions In view of the current advances in the surgery and the radiotherapy of cancer the author's assumption that these methods have reached their limits in cancer of the upper jaw is perhaps not warranted, but certainly the earlier the diagnosis is made the better will be the result of treatment.

**A Handbook on Diseases of Children Including Dietetics & the Common Fevers** By Bruce Williamson M D F R C P Fourth edition Cloth Price $4 50 Pp 388 with 81 illustrations Baltimore William Wood & Company 1945

The fact that this little handbook has reached its fourth edition is an indication of its popularity The author covers an amazing range of topics The book gives a splendid synopsis of pediatric diseases including the recently recognized entities It will serve as an excellent brief review for the general practitioner and the pediatrician.

## ATYPICAL LICHEN PLANUS

*To the Editor*—*Information is requested concerning the latest therapy for chronic atypical lichen planus occurring after twenty two months residence in India and the ingestion of atabrine daily for four months*

W P Conlan M D Holbrook Mass

ANSWER—There is no specific therapy for the syndrome referred to as atypical lichen planus Experience has shown that the condition tends to involute when patients suffering from this disorder are returned to the United States and atabrine is discontinued However the involution is slow and may require many months to become complete Furthermore, pigmented relics may persist for a much longer time and in some cases hypertrophic lesions may result in permanent atrophic scarring

The manifestations of the disorder are so varied in different cases and even in different areas and at different times in the same patient that local treatment is of necessity symptomatic Exudative lesions should receive only soothing measures, and stimulating preparations such as tar should be reserved for hypertrophic nonexudative areas If the latter type of lesion is unusually persistent a few fractional doses of x-ray therapy may be used, but they should be undertaken with the full realization by both patient and physician that atrophy is the natural end result of some of these lesions Mouth involvement if distressing to the patient may be benefited by mild alkaline washes Except when clinical atrophy occurs in the scalp the hair is not permanently damaged and any alopecia present may be expected to disappear in time

In general the treatment other than local is that designed to promote the general health of the patient and tonics should be given freely as indicated There is some evidence that nutritional inadequacy, especially in respect to vitamin A, has been one of the factors in the pathogenesis of this disorder Accordingly, it is probably advisable to administer large doses of this preparation over a reasonable time even in the absence of laboratory evidence of hypovitaminosis A

## OPERATION ON SEPTUM IN 13 YEAR OLD BOY

*To the Editor*—*A boy aged 13 years has a deviated nasal septum and is subject to frequent upper respiratory infections He has had a tonsillectomy and adenoidectomy Is he too young to have a septum operation and would this operation have much of an effect on preventing his colds? Do you think an allergy workup should be done before he is operated on?*

M D New York

ANSWER—A patient of this age is not too young to have a septum operation if he really needs one On the other hand the need for it must be great indeed to warrant its performance on a 13 year old Most parents would hesitate to give permission, and there is a psychologic hazard involved in addition to whatever physical risks there may be to the operation Most of the time too there is little reason to believe that a septal deviation by itself is the main or chief factor in producing upper respiratory infections And still from time to time a septum operation does seem to make a difference

Before recommending it in any case, however, as a factor in preventing colds, a careful examination should be made to rule out all other factors and this includes allergy studies

## DIALYZED MILK

*To the Editor*—*In the Oct 20 1945 issue of The Journal there appeared an article on Sodium Restriction in the Diet for Hypertension by Grollman and others How can dialized milk be prepared from regular milk or is there any such milk commercially available?*

Hyman A. Vogel M D Detroit

ANSWER—Since a quart of milk contains over 5 Gm of sodium, this must be removed if used in a diet intended to be restricted in sodium content. The sodium can be removed from regular milk by placing it in a semipermeable membrane around which a steady stream of water circulates For this purpose visking tubing (obtainable from the Visking Corporation, Chicago) may be used One end of an approximately 5 foot length of tubing is tied off and the milk introduced through the open end, which is then also tied and the filled tube placed in a cylinder through which water circulates Dialysis must continue for approximately forty-eight hours, and the circulating water must be maintained at a low temperature in order to avoid spoilage A dried milk powder which has been freed from its sodium content has been prepared commercially However this is available at present only for experimental trial and is not on the market.

## POSSIBLE MONILIASIS

*To the Editor*—*A boy aged 4 developed dermatitis involving the penis scrotum abdomen chest and lower extremities during infancy This would develop under the diaper and spread up and down the body The foreskin of the penis would become erythematous and edematous as would the skin of the scrotum abdomen chest and lower extremities It responded best to gentian violet rather than ointments These outbreaks occurred about every two months especially if he developed an upper respiratory infection Another skin condition developed about the age of 2. If he received a bruise the traumatized area developed vesicles around it About 200 vesicles would appear containing a clear fluid They were small and would respond best to gentian violet treatment At the age of 3 he became nervous and began to stammer About this time he also began to develop a skin condition between his toes This would develop during an upper respiratory infection or any type of systemic disease The skin between his toes would first become red and swollen for the first forty-eight hours. This is a painful stage After the first forty-eight hours vesicles appear between the toes and the pain begins to subside The vesicles become large and usually have to be opened A clear fluid exudes when they are opened and the pain begins to disappear Gentian violet dries up the lesions best after they have been opened but they usually take one to two weeks to heal At the same time he develops edema and erythema of the foreskin of the penis and his scrotum He also develops a macular lesion (similar to a measles rash) over the abdomen and lower part of the chest and under the knees as well as on the thighs Sometimes he develops this lesion on any part of the body except the face There is usually fever (up to 101 6 F) on the first day before the vesicles appear between the toes Could you offer a diagnosis and a treatment for this skin condition? Is it a metabolic disease? What prophylactic treatment would you use to prevent the outbreaks? He has had two of them in the last five weeks (he had a cold each time)*

M D Indiana.

ANSWER—It is impossible to offer more than a suggestion as to the diagnosis More information would be desirable, such as the results from a bacteriologic study A diagnosis to consider is moniliasis and monilid This comprises a group of conditions that involve the folds of the skin and the mucous membranes and is caused by yeast organisms, specifically Monilia albicans In the mouth the disease is known as thrush. On the skin the lesions are usually sharply outlined They have a bright red appearance and a sodden scale The latter is often peripherally placed and has an opalescent or dead white appearance Frequent sites of involvement are the commissures of the lips (where it is known as perleche), the nail folds (where it is termed mycotic paronychia), on the webs of the fingers (where it is known as erosio interdigitalis saccharomycetica), beneath the breasts, in the folds of the abdomen in corpulent persons, in the axillas, in the perineum and between the toes

At times, disseminated eruptions of various types may appear simultaneously with the presence of true moniliasis as described This accompanying rash is supposedly due to the development of an allergy to the yeast organisms or their toxins in and emanating from the local infection The secondary lesions are called monilids or levurids Perhaps the most effective treatment for moniliasis is keeping the parts dry and the application of gentian violet solutions One or 2 per cent aqueous solutions are adequate For the patient mentioned in the query, gentian violet applications were helpful

## CONTRACEPTION AFTER MENOPAUSE

*To the Editor*—*In Queries and Minor Notes in The Journal March 16 the answer to the question under the heading Contraception Six Years After Menopause flatly denies the need for contraceptive measures for such a patient and states that there is no case on record of a gestation having occurred under these circumstances This is definitely at variance with statements in the European medicolegal literature (see Hofman Haberda Lehrbuch der gerichtlichen Medizin Urban and Schwarzenberg 1927 p 65 Marcuse Handwoerterbuch der Sexualwissenschaften Bonn Markus and Weber 1926 p 367) The cases referred to there are not of recent date but there is no reason to doubt the occurrence of a pregnancy in a comparatively old individual when reported by good observers only because at that time the knowledge of the physiology of reproduction was more than fragmentary In addition to the cases mentioned by these two authors another one reached in the twenties of this century the superior court in Koblenz (Rhineland) Here the situation was identical with that indicated in your correspondent's query and the practitioner consulted had given an unequivocal answer identical with The Journal's. The woman became pregnant and the doctor was held liable by the court and had to pay a large sum of money to his former patient for his advice*

*It is difficult to explain these pregnancies taking place years after the menopause However one encounters occasionally in operative specimens of postmenopausal patients evidence of still extant follicular activity (corpora lutea in regression) without any indication of menstrual flow It may be that these late and extremely rare contraceptions are possible on the basis of such or a similar endocrine anomaly*

## GOUT STILL A FORGOTTEN DISEASE

JOSEPH P McCRACKEN, M D PHILIP S OWEN M D
and
JOSEPH H PRATT, M D
Boston

More than two hundred and sixty years ago Thomas Sydenham[1] published a clear description of the diagnostic features of acute gout It would seem that in the course of nearly three hundred years every well educated physician would be familiar with the simple clinical picture presented by Sydenham and thereby be able to recognize the disease in its typical form without difficulty Such is not the case Ten years ago Herrick and Tyson[2] published a paper entitled "Gout—A Forgotten Disease" That gout is still a forgotten disease as late as 1945, the following case report indicates

*History*—Mrs. R W, aged 68, in descending a stairway on June 26 twisted her right ankle Walking became painful and there was swelling of the outer part of the ankle with black and blue discoloration of the skin On the night of June 28 at bedtime the right big toe at the metatarsophalangeal joint began to throb Her sleep was so much disturbed by pain in the toe that she arose at 2 a. m and wrote letters The pain was worse the next day The toe was so tender the night of June 29 that the pressure of a sheet was painful She slept poorly on account of the pain The next day, June 30 she was unable to bear her weight on the right foot The toe was "as tender as a boil" Dr A, the first physician to be consulted, saw her that forenoon His diagnosis was acute bursitis As the pain continued unabated throughout June 30 and the following night the patient sent for another physician, Dr B, who diagnosed the condition as an acute infection of the foot (phlegmon) and prescribed a sulfonamide drug Both doctors stated later that the idea that it was gout never occurred to them The patient returned from Cape Cod to her home in Boston the same day, as the pain was almost unendurable, to consult a surgeon. Dr C, whose diagnosis was bursitis, failed to recognize that he was dealing with a case of gout even after the great toe of the other foot became painful, swollen and tender He thought that in moving about the room she had bruised the left big toe while attempting to spare the right foot As the pain continued and the swelling spread, she consulted an orthopedic surgeon, Dr D, on July 6 By that time the patient received word from a medical friend who had heard the details of the case that she undoubtedly had gout and recommended colchicin Both Dr C and Dr D asserted that this was a dangerous drug and they were unwilling to employ it As they said it might injure the liver, they evidently confused it with cinchophen Although given the correct diagnosis, Dr D employed orthopedic measures and gave no instruction regarding diet or the use of alcohol The patient was overweight and admitted taking a whisky cocktail about five nights out of seven before dinner The blood uric acid was increased, being 7 mg per hundred cubic centimeters of blood (the upper limit of normal by the method employed is 6 mg per hundred cubic centimeters) This confirmatory evidence of gout was not needed

Four doctors in succession failed to recognize that the patient had gout although this attack corresponded with Sydenham's classic description in all essentials The onset two days after she sprained her ankle was sudden She could fix the exact hour It began as she was preparing for bed with pain in the great toe joint Sydenham said that "about 2 o'clock in the morning the patient is awakened by a severe pain in the great toe The pain at first moderate becomes more extreme" This was true in our case She said she could not sleep and at 2 a m left her bed and to divert her attention from the pain wrote letters The pain increased and the following night the extreme tenderness of the toe could be described in Sydenham's words "so exquisite and lively meanwhile is the feeling of the part affected that it cannot bear the weight of the bedclothes' At first "the only visible swelling had been the veins of the affected joint" After some hours, possibly twenty-four hours after the onset, "the patient on awaking is freer from pain and finds the part recently swollen A few days after, the other foot swells or suffers the same pain" This occurred in our case " Gout attacks women but rarely and then chiefly the aged and masculine Our patient was 68 at the time of this her first attack and weighed about 185 pounds (84 Kg)

*Family History*—The patient's father died at the age of 63 of congestive heart failure. For many years preceding his death he had repeated attacks of what was called "acute rheumatism" The feet were the seat of some attacks the hands of others He would be laid up for six weeks at a time There would be swelling of the affected parts, and the pain was severe. He would be unable to move about when the feet were involved Between the attacks the joints were normal

Her paternal grandmother also had many attacks of "acute rheumatism' during which the tenderness of the feet was so intense that she could not bear the weight of the bedclothes In the intervals between attacks the feet were normal

It will be noted that the attacks of arthritis in both father and grandmother correspond to Sydenham's description of acute gout The fact that between attacks the joints are normal and the health excellent is important in differentiating gout from rheumatoid arthritis Aretaeus (second to third century A D) stated that a person in the interval between attacks has won the race at the Olympic games Hench and his co-workers[3] at the Mayo Clinic, in a comparative study of 100 cases each of gout, rheumatic fever and infectious nonspecific arthritis, concluded that "an arthritis which occurs

acutely or subacutely and is associated with complete remission should be considered gout until proved otherwise"

The evidence seems convincing that in the family under consideration unrecognized gout has existed in three generations

Massachusetts is, of course, not the only state in which gout is a disease unknown to many doctors One of our patients who had typical attacks of gout affecting the toe and other parts of the foot was seized later while living in Texas with severe inflammation of the right knee and ankle Although we wrote the attending physician that the patient had had typical attacks of gout in the past, he insisted on his diagnosis of infectious arthritis The patient was given very large doses of vitamin D, and tonsillectomy was performed to remove the supposed focus of infection At the height of this attack the patient was unable to move, so great was the pain Once owing to his helpless condition he fell out of bed He was found on the floor unable to move his right leg The doctor's examination must have been hasty, for he asserted the patient had had a "cerebral embolism" which had paralyzed the right leg The patient told one of us later that it was not loss of muscular power but pain that kept him motionless Sydenham had seen such cases, for he wrote "the least contrary movement causes pain, which is tolerable only in proportion as it is momentary This movement is one of the great troubles in gout, since with perfect quiet the agony is just tolerable"

Equal ignorance of gout was shown by the physician of one of our patients who after removing a tophus from the ear and noting its chalklike contents still adhered to his diagnosis of rheumatism

Additional evidence that gout is an unknown disease to many physicians was furnished by the experience of the Mayo Clinic, where in a series reported by Hench [3] only 12 per cent of the cases had been recognized as gout prior to admission, although in the majority characteristic symptoms had existed for years

With the hope of calling attention to this forgotten disease by presenting anew its clinical features, we have made a detailed analysis of 100 cases of gout previously unreported and made a comparison of our findings with a series of 657 cases collected from the recent literature In each case included in our Boston series there was no doubt of the correctness of the diagnosis, as all cases in which it could be questioned were discarded This group of 100 cases consisted of 37 from the Joseph H Pratt Diagnostic Hospital, 29 cases from the private records of one of us (J H P), 27 from the medical and surgical records of the Peter Bent Brigham Hospital during the period 1935-1941 made available to us by Dr Soma Weiss, and 7 from the medical clinic of the Boston Dispensary

## CLASSIFICATION

Ninety-three of our cases were acute gout The remaining 7 should be classed as chronic gout This term is given to those cases in which persistent deformity or rigidity of the joints occurs It is gratifying to note that although many of our patients had recurrent attacks over many years few became permanently crippled Febrile polyarticular gout is a severe type of acute gout in which several to many joints are involved in a single attack There is usually high fever, and the duration of the attack is measured generally in weeks rather than days. Ten of our cases fall into this group In 1 the temperature reached 104 F and in another 103 F

## SEX

Of the group, 91 were men and 9 were women The reported incidence of gout in women varies from less than 1 per cent [4] to as high as 36 per cent [5] However, the majority of the reports range between 3 and 7 per cent Of a total of 1,484 cases reported in the recent literature [6] in which the sex is stated, 98 instances were in women, or 6 6 per cent. Vorhaus and Kramer's [5] figures show a far higher percentage of gout in women than do any other series, and their findings in other respects vary from those given in all other published statistical reports as will be shown later If their series is excluded, the percentage of gout in women falls to 6

## RACE

Approximately one half (48 per cent) were of American parentage This incidence is similar to that noted by Williamson [4] and also Talbott [7] The remaining racial groups are as follows Jewish 15, Italian 12, Irish 7, English 3, German 3, Negro 3, Canadian 2, French 2, Austrian 1, Greek 1, Lithuanian 1

It has frequently been stated that gout is rare in the Negro As just noted, only 3 cases in this series were in the Negro Williamson's Chicago series [4] included 2 Negro patients, Schnitker and Richter's [8] 2, 1 of whom was a Negro woman Cohen [9] had 1 Negro in a series of 47 patients admitted to the Philadelphia General Hospital (1905-1929)

## AGE

The age of the patient at the onset of the initial attack varied from 19 to 73 years In a small number of instances the age at the first attack was only approximate In 58 per cent of the cases the onset was between the ages of 41 and 60, and in 79 per cent it was between the ages of 31 and 60 Arranged by decades, the ages vary from 19 to 30 years 14 cases, 31 to 40 years 21 cases, 41 to 50 years 30 cases, 51 to 60 years 28 cases and 61 to 73 years 7 cases

The average age of our entire group was 46 8 years at the onset of the initial attack This figure is within the range generally reported Kinell and Haden [10] 43 5, Jacobson [11] 47 1, Monroe [12] 39, Sherwood [13] 46 3, Williamson [4] 38 and Brøchner-Mortensen [9] 47 7, Talbott [14] being the lowest with 32 0

Sixty-six per cent of Williamson's [4] patients were between 30 and 50 years of age, 50 per cent of Sherwood's [13] between 31 and 50, 60 per cent of Kinell and Haden's [10] between 33 and 50, 75 per cent of Brøchner Mortensen's [9] between 31 and 60 Seventy-two per cent of Monroe's [12] patients were over 30 and 88 per cent of Hill's [15] were over 35

15 Hill I C Gout Lancet 1 826-831 (April 9) 1938

The youngest patient in our group was 19 years of age and the oldest was 73 at the time of the initial attack of gout The average age of the entire group when admitted to the hospital was 56 2 years The average period of duration from the first attack to the time these studies began was ten years Schnitker and Richter [8] also found that the average duration of gout prior to the initial hospital visit was ten years Other reported figures vary seven years (Kinell and Haden [10]), 8 8 years (Vorhaus and Kramer [5]), 11 5 years (Hench [3])

### FAMILY HISTORY

In only 18 (18 per cent) cases was there a recorded history of gout in the family In the English series of Hill [16] the hereditary aspect was much greater, 45 per cent having a history of gout and of fibrositis in an additional 15 per cent Other sources give a varying percentage 6 (Monroe [12]), 9 7 (Williamson [4]), 10 (Cohen [16]), 11 (Brøchner-Mortensen [9]) The first 3 of this series occurred in America, the last in Denmark

### DIETARY HISTORY

In 14 records emphasis was made of large amounts of meat in the diet In 63 cases the dietary habits were considered to be moderate No comment was noted in the remaining 23 records

Obesity of a degree sufficient to warrant comment was recorded in 41 cases In Kinell and Haden's [10] series 83 7 per cent were 5 pounds (2 3 Kg ) or more overweight, Williamson [4] found that of 101 patients 92 were described as well nourished In only 5 of 84 cases studied by Brøchner-Mortensen [9] was the weight lower than 10 per cent of what was considered the ideal weight However, Schnitker and Richter [8] concluded that obesity did not seem more common than expected

### ALCOHOLIC HISTORY

In 26 instances the alcoholic intake was considered frequent and excessive, in 28 it was stated as moderate, in 32 from only occasional to no indulgence There was no comment in the remaining 14 cases

Williamson [4] found only 4 abstainers in his large series of 116 patients with gout, 9 who partook in small amounts, 41 only moderately, with the remaining considered as heavy drinkers Monroe [12] states that 62 per cent of his Boston patients were habitual consumers of alcohol, but only 3 were drunkards In 83 of the patients studied by Brøchner-Mortensen,[9] 13 were total or nearly total abstainers, 11 consumed alcohol but not daily, 31 drank one to two bottles of beer daily, 31 five to ten bottles of beer daily and 17 drank more than ten bottles a day

### PRECIPITATING FACTORS

In about one half of the cases various conditions seemed to precipitate an attack of gout These may be listed after moderate to excessive walking 9 cases, mild trauma to the foot or toes 8, after alcohol indulgence 7, with or following upper respiratory infections 5, during the holiday season 4, after parenteral liver injections for anemia 3, after minor operations 2 and tooth extraction, diathermy treatment, cardiac failure, acute cholecystitis, Sippy dietary regimen, bleeding duodenal ulcer 1 each

### OCCUPATION

Our series of only 91 men included a scientist of international reputation, an ex-Senator of the United States, a judge of the Superior Court of his state, a Representative in Congress and several wealthy industrialists and lawyers in addition to 4 physicians Hence it would seem evident that Sydenham's observation still holds good that gout affects "more rich men than poor, more wise men than simple" Naturally laborers predominated among the patients in the public wards and in outpatient practice Thirty-two per cent of our group fell into this class There were 3 painters It has long been known that lead and gout are in some way related, 9 4 per cent of Williamson's cases were among painters One of Schnitker and Richter's patients had chronic lead poisoning

### TOPHI

In 32 cases subcutaneous tophi were found In 23 of these the tophi were located in the ear Other locations were the olecranon bursae 7 instances, feet 4, fingers 3, legs 2, hand 1 and over the clavicle 1 Several patients had tophi in more than one location

In table 1 there are listed the incidence of subcutaneous tophi in a number of other series of gout patients If the entire group of cases is totaled, it is seen that tophi were found in 45 7 per cent of the entire 750 cases in which their presence or absence was stated Osler in the 1905 edition of his textbook pointed out that the ears should always be inspected in a case of polyarthritis The diagnosis may rest with a small tophus The student should learn to recognize on the ear margin Woolner's tip, fibroid nodules and small sebaceous tumors These may be mistaken for tophi To make the diagnosis with certainty, the needle-shaped crystals of sodium urate should be demonstrated under the microscope or a positive murexide test be obtained

TABLE 1.—*Subcutaneous Tophi*

| Author | Number of Cases | Number with Subcutaneous Tophi | Per Cent of Cases with Tophi | Per Cent of Cases with Tophi in Ears |
|---|---|---|---|---|
| Brøchner Mortensen | 100 | 33 | 33 | 85 |
| Hench | 100 | 53 | 53 | |
| Hill | 93 | 40 | 43 | 87 5 |
| Jacobson | 21 | 10 | 48 | 80 |
| Kinell and Haden | 62 | 14 | 23 | |
| Monroe | 61 | 42 | 69 | 90 |
| Talbott | 24 | 14 | 58 | |
| Vorhaus and Kramer | 25 | 17 | 68 | |
| Williamson | 116 | 66 | 56 | 68 |
| This series | 100 | 32 | 32 | 72 |
| Total | 702 | 321 | 45 7 (Average) | |

### FOOT INVOLVEMENT

The great toe was the site of acute arthritis in 78 per cent of the cases in the initial attack of gout In subsequent attacks this percentage of podagra was increased to 97 Table 2 shows other joints involved in the initial attack and in the whole number of attacks

Table 3 gives the incidence of podagra in the initial attack and in later attacks in the collected series of cases It is evident that the great toe is involved in more than one half of the cases in the initial attack The percentage in which the big toe is involved in all the series averages 68 Vorhaus and Kramer's [5] figure of 28 per cent is far at variance from all other statistics If this series is excluded the percentage rises to 72 Also in most of the cases the great toe is involved later, if not in the first attack

16. Cohen A Gout Am J M Sc. **192**: 488-493 (Oct.) 1936

### BLOOD URIC ACID

The statement is sometimes made that early cases of gout present as a rule a blood uric acid content that is less than in cases that have existed for some time An analysis of our cases according to the duration of the disease is given in table 4 It shows that the

TABLE 2—*Joints Involved*

| Joint Involved | In First Attack | In Initial or Subsequent Attacks |
|---|---|---|
| Great toe | 78 | 97 |
| Ankle | 21 | 51 |
| Foot | 18 | 30 |
| Knee | 9 | 36 |
| Wrist | 5 | 20 |
| Hands and fingers | 4 | 27 |
| Elbow | 3 | 24 |
| Other toes | 3 | 14 |
| Shoulder | 2 | 10 |
| Cervical spine | | 2 |
| Hip | | 4 |
| Sternoclavicular | | 1 |

blood uric acid is usually increased in the initial attack and as the disease progresses no rise in the amount of uric acid is regularly found The highest average values occurred during the first four years after the onset of the disease In this table results obtained by various Folin methods are given from the first (1913) to the last (1933) When only those cases in which the blood uric acid was determined by Folin's 1933 method were analyzed the same result was obtained Brøchner-Mortensen,[9] on the other hand found higher values as a rule after the first five years In 25 cases examined during an attack the blood uric acid averaged 5 8 mg per hundred cubic centimeters In 25 cases during an attack-free interval the average was 6 2 mg per hundred cubic centimeters In 25 cases without tophi the amount of blood uric acid averaged 6 7 mg per hundred cubic centimeters In 25 cases with tophi it was 5 1 mg per hundred cubic centimeters In 16 cases there was no significant increase in the blood uric acid, as the amount was below 5 mg per hundred cubic centimeters in all determinations In

TABLE 3—*Involvement of Great Toe*

| Author | Percentage of Cases with Involvement of the Great Toe: Initial Attack | All Attacks |
|---|---|---|
| Brøchner Mortensen | 70 | 71 |
| Cohen | 51 | |
| Hench | 58 | |
| Kinell and Haden (Foot or ankle) | 53 / 80 | |
| Monroe (Foot or ankle) | 74 / 90 | 98.3 |
| Sherwood | 75 | |
| Talbott and Coombs et al (foot) | 75 | |
| Vorhaus and Kramer | 28 | 68 |
| Williamson | 88 | 95 |
| This series | 78 | 97 |

17 cases it was below 4 mg per hundred cubic centimeters in single determinations and hence not diagnostic of gout

### RENAL DAMAGE

In 23 cases there was albuminuria. Casts were found in 16 In 10 cases tests revealed impaired renal function In 11 cases the clinical diagnosis of nephrosclerosis was made, and in 1 the diagnosis of chronic pyelonephritis Renal calculi were present in 6 cases

In 31 per cent of Schnitker and Richter's[8] cases the diagnosis of nephritis had been made Fifteen of their cases were nephrosclerosis, the other 2 chronic glomerulonephritis In one half of the cases reported by Kinell and Haden[10] there was noted a faint to a heavy trace of albumin, but in only 3 instances was the presence of casts mentioned In the same series renal calculi were present in 11 per cent Of Hench's[3] 100 patients, 11 either had or gave a history of renal stones, 1 had passed gravel, 14 had varying degrees of renal insufficiency Most of the 22 cases studied by Coombs, Pecora and their associates[17] showed some evidence of renal damage, with renal calculi present in 7 (32 per cent) In 45 per cent of Williamson's[4] cases albuminuria was present, but in only 7 of 116 cases of gout in his series was the diagnosis of nephritis made In the 100 cases studied by Brøchner-Mortensen[9] nephrosclerosis was diagnosed in 14 chronic glomerulonephritis in 7 and nephrolithiasis in 15

### ROENTGEN RAY FINDINGS

Roentgen ray interpretations "compatible with gout" were recorded in 23 cases In 17 they were negative In 11 hypertrophic arthritis was demonstrated, in 6 atrophic arthritis, in 3 both hypertrophic and atrophic

TABLE 4—*Duration of Disease*

| | Number of Cases | Average Mg Uric Acid per 100 Cc. |
|---|---|---|
| First attack | 15 | 5.3 |
| 1 month to 1 year | 4 | 6.0 |
| 2 years to 5 years | 20 | 6.0 |
| 6 years to 10 years | 20 | 5.9 |
| 11 years to 20 years | 13 | 5.3 |
| 21 years to 30 years | 9 | 5.5 |
| 31 years to 40 years | 4 | 5.1 |
| 41 years to 50 years | 1 | 5.0 |
| Total | 87 | |

arthritis In the remaining 38 cases roentgenograms were not taken

In only 1 of our cases was the roentgenologist willing to make a definite diagnosis of gout In this case the diagnosis was perfectly clear without x-ray evidence as the patient had tophi Our roentgenologists realized that small punched out areas in the margins of the bones may occur in other forms of arthritis as well as in gout This was first pointed out by McClure and McCarty[18] many years ago They insisted that a definite diagnosis of gout could not be made on an x-ray examination The statement Williamson[4] wrote a quarter of a century ago still stands as correct "The roentgen ray is of very little service from a diagnostic standpoint In nearly two thirds of all the cases submitted to it [roentgen ray] it not only failed to assist in the diagnosis but tended if anything, to lead one to arrive at wrong conclusions"

### BLOOD STUDIES

*Red Blood Cell Count*—In the 63 or 80 per cent of the cases in which the red blood cell count was recorded, the value was 4,000,000 or more per cubic millimeter, of the 6 patients having an anemia of less than 3,000,000 red cells 2 had chronic nephritis, 1 had cirrhosis of the liver in addition to chronic nephritis 2 had undoubted pernicious anemia, and 1 had an atypical macrocytic anemia which was questionable pernicious anemia

17 Coombs, F S, Pecora, L J, Thorogood E Consolazio W and Talbott J Renal Function in Patients with Gout J Clin Investigation **19** 525 535 (May) 1940

18 McClure C and McCarty E Roentgenographic Studies in Gout Arch Int Med. **24**: 563-579 (Nov) 1919

*Hemoglobin* (Sahli's method)—In 61, or 76 5 per cent of the cases in which a hemoglobin determination was recorded the value was 80 per cent (Sahli) or more Of the 4 patients in whom the determination ranged between 60 and 70 per cent 3 had chronic nephritis The 5 patients who had less than 50 per cent hemoglobin included 2 with chronic nephritis 1 with chronic nephritis and cirrhosis of the liver, 1 with pernicious anemia and 1 with hypochromic anemia due to blood loss in carcinoma of the stomach

*White Blood Cells*—In 68 or 90 per cent of the cases in which a white blood cell count was recorded the value was less than 12 000 per cubic millimeter Of the 2 patients whose leukocytosis was 15,000 or more each was in an acute attack of gout

The foregoing findings are similar to those recorded in other series In Sherwood's [18] series of 20, 90 per cent had a hemoglobin value of 80 per cent or more Monroe [19] reports that the average hemoglobin determination was 91 per cent and the red blood cell count averaged 4 900,000 per cubic millimeter One half of Kinell and Haden's [10] series had a red cell count of 4 800,000 per cubic millimeter, and 45 per cent had a hemoglobin value of 90 per cent or more

### BLOOD SEDIMENTATION RATE

The blood sedimentation rate obtained with the Westergren method was determined in all but 8 of the 50 cases studied at the Pratt Diagnostic Hospital and the Boston Dispensary These 42 cases in which one or more values were recorded may be divided into "acute," "subsiding" and "nonactive" groups of gout The highest value recorded in each case was used in this analysis

In the "acute" group (30 cases), only 7 showed a blood sedimentation rate of 20 mm or less in one hour In 1 instance the value was 2 mm in one hour but was 52 mm in two hours, which leads one to surmise an error in the hour reading Of this "acute" group, excluding the aforementioned case, only 3 were below 15 mm in one hour Of the remaining 23 cases in this group 11 gave values between 20 and 40 mm 5 between 40 and 60 mm, 4 between 60 and 80 mm 1 of 87 mm, 1 of 104 mm and the highest was 111 mm in one hour

In the "subsiding" group there were 4 cases giving values of 5 12, 14 and 31 mm in one hour In the "nonactive" group there were 8, the values being 6, 6, 7, 18 23, 28 36 and 50 mm in one hour The last value occurred in a patient who also had chronic nephritis and an active duodenal ulcer

Of especial interest is a case of acute gouty arthritis in which the blood sedimentation rate was determined daily throughout the attack These five daily values were 87, 70, 74, 38 and 36 mm in one hour The declining values coincided with the complete relief of the symptoms of the gouty attack

### TEMPERATURE

Of the cases in which the attack of gout was observed in the acute stage, the temperature was recorded in 46 instances All cases were excluded in which additional disease processes were present, which may have had an influence on the temperature

The highest temperature elevation observed while the patient was hospitalized was taken in each instance and this constituted the following data Less than 99 F in 17 cases, from 99 to 100 in 18, from 100 to 101 in 6 from 101 to 102 in 2, from 102 to 103 in 2 cases and 104 F in 1 case From this grouping it is seen that 63 per cent of the acute cases of gout in which the temperature was recorded (46) was 99 F or more, with 24 per cent showing a temperature elevation of 100 F or more There were 2 instances of an elevation as high as 103 F The maximum temperature was 104 F

### DIAGNOSIS OF GOUT

Forty-one cases of gout in this series of 100 had not been correctly diagnosed during previous attacks the diagnosis being first made when seen in our clinics Forty-four cases had previously been recognized as gout Ten were seen in their first attack by the Brigham Hospital physicians or by us, the remaining 5 records did not give information on this point It is thus seen that in 41, or 48 per cent, of the cases in which one or more previous attacks of gout had occurred the disease had not been recognized This would indicate that to nearly 50 per cent of the many doctors who had examined and treated these patients gout was an unknown disease This record is certainly bad but it is far better than the figures published by Hench [3] These showed that in a series of 100 cases of gout treated at the Mayo Clinic only 12 per cent had been correctly diagnosed prior to admission

In 32 of our cases gout had existed five years or more before the diagnosis was made in 20 cases ten years or more, in 14 cases fifteen years or more, in 8 cases twenty years or more and in 2 cases thirty years or more The longest length of time before it was discovered that the patient had gout was thirty-nine years

### DIAGNOSIS OTHER THAN GOUT

In 41 cases obesity was present Thirty-eight of the group showed arterial hypertension Eleven cases of chronic nephritis were diagnosed There were 9 instances of hypertensive heart disease and 8 of arteriosclerotic heart disease In 4 cases cirrhosis of the liver was noted, and in a like number there was evidence of diabetes mellitus Additional single diagnoses were legion

### TREATMENT

Our experience justifies the high reputation in which colchicum has always been held by authoritative writers on gout "A patient may be in helpless agony with a tumefied red hot joint today and walking about quite well, tomorrow" So wrote Thomas Watson nearly a century ago For no other drug can such a claim be made Forty-four of our patients on whom we have good notes were treated during acute attacks with a colchicum preparation, usually colchicine In 37 cases improvement was rapid and often dramatic Pain was often abolished in from twelve to twenty-four hours after the first dose of colchicine Usually 0 5 to 1 mg was given hourly for from four to eight doses In only 7 cases was there little or no benefit

Cinchophen was employed in 14 cases according to our records, and usually with striking benefit It acted well in 4 acute cases in which colchicine had failed to reduce the pain Usually from 1 5 to 3 Gm of cinchophen was given daily for three or four days In no instance was a toxic action observed *Our experience* indicates that the widespread fear of employing this drug deprives patients of a valuable remedy It might be well to test the urine for urobilinogen frequently when a patient is taking cinchophen in order to guard against toxic action on the liver This is done as a routine procedure in the Boston Dispensary at the suggestion of Dr Karl Singer

## CONCLUSION

The most important point brought out by this study is the inexcusable delay in the recognition of gout. Forty-eight per cent of the cases had not been recognized as gout when admitted to our clinics, although the duration of the disease was ten years or more in 20 cases and many physicians had been consulted. In only 21 per cent of the cases was the correct diagnosis made during the initial attack, although in no less than 78 per cent the big toe was involved. At the time the cases in our Boston series came under our recorded observation the percentage in which the big toe had been the seat of one or more attacks had risen to 97. It is evident that physicians do not yet realize that acute inflammation of the first metatarsophalangeal joint almost always means gout and should be so regarded and treated until proved otherwise. Unless the disease is recognized, adequate treatment is impossible. In few diseases is the pain so intense as in acute gout, and in none is a drug for its relief so effective as colchicum in gout. The failure of practitioners to use this remedy owing to their failure to recognize gout still causes a great amount of needless suffering.

# DIAGNOSTIC VALUE OF EXFOLIATED CELLS FROM CANCEROUS TISSUES

GEORGE N. PAPANICOLAOU, M.D., Ph.D.
New York

I value greatly the honor of having been invited by this renowned institution to give an account of my recent investigations pertaining to the diagnosis of malignant neoplasms before such a select audience, including many who have devoted themselves to the study of the theoretical and clinical aspects of cancer. I am undertaking this task with a feeling of deep appreciation but not without some apprehension. I consider myself a novice in this vast and complex field of cancer research, but my intrusion has not been at all intentional. It was forced on me by unavoidable and uncontrollable circumstances which have deflected the course of my scientific endeavors.

When the late Professor Stockard and I embarked on the study of the morphologic and cyclic variations of desquamated epithelial cells in the vagina of the guinea pig some thirty years ago[1] our aim was specific, though rather limited. We were in search of a method which would allow us to identify the consecutive stages of the estrous rhythm. The idea of such an exploration was not new. As far back as 1847 Pouchet[2] had studied vaginal smears for the purpose of analyzing the normal human sex cycle. Pouchet studied unstained smears and therefore could not make accurate cytologic observations. Precise preservation and staining of the cellular elements are of paramount importance. In our own studies we have been fortunate in having developed a simple method of fixation that has proved to be very efficient. Had we adopted the dry and nonfixed smear technic we would never have been able to apply it with equal success in the cytologic evaluation of some physiologic and pathologic conditions, including cancer. The sharp definition of cells, the finer details of their nuclear structure and their staining affinities are greatly impaired if allowed to dry before fixation.

The introduction of the vaginal smear procedure in 1917 revived the interest of biologists and physiologists in the study of problems related to mammalian sex physiology. Within a relatively short time it led to many important achievements in this field and to the isolation of the estrogenic hormone, which was soon followed by that of some of the other sex hormones. Its first application in the diagnosis of cancer of the uterus dates back to 1923, when I began a comprehensive study of human vaginal smears during the normal menstrual cycle and in various pathologic conditions. This investigation was conducted for about nine years at the Woman's Hospital under the auspices of Dr. George Gray Ward with the support of the Cornell Medical School and of the Committee on Maternal Health. The results of these studies were published in a short article[3] in 1928 and in a monograph[4] in 1933. Despite the early recognition of the fact that malignant tumors of the uterus could be diagnosed by the vaginal smear test and the conclusive evidence offered by a large number of cases, I must admit that I failed utterly in arousing the interest of clinical men in the potentialities of this diagnostic method and in gaining their confidence.

This failure dampened my own faith and enthusiasm considerably and was responsible for my devoting the next seven years chiefly to problems of experimental and human sex endocrinology. Looking back to that distant period with a more objective eye, I now realize that the fault was largely mine. First of all, I had given only a short and incomplete account of my observations relating to cancer diagnosis. Then, not being a pathologist, I had been greatly handicapped by my inadequate pathologic training, which prevented me from grasping the full significance of certain deviations from the normal cell pattern and their relationship to the different types of neoplasms. I must confess that this is still my most serious handicap, although I have been trying hard during the last few years to get some belated education in this vast and still insufficiently explored field of cancer pathology. One of my colleagues tried to convince me lately that my lack of pathologic perspective has been an advantage rather than a disadvantage, as it has most likely protected me from having been influenced by any set ideas. It is not infrequent, indeed, to find men, even prominent scientists, who have become dogmatic because of such set ideas and strong beliefs, which have prevented them, or others who have been under their influence, from having an unbiased and objective attitude toward certain facts which are at variance with their beliefs.

Last spring I had in my laboratory a young pathologist from Peru who was referred by the Commonwealth Foundation to study our smear technic. After having spent about two weeks with us he stepped into my room one day to show me a slide of a vaginal smear which he was studying. He thought that it was marked incorrectly as pyometra, as he had found many cell groups which he believed were definitely suggestive of

an adenocarcinoma of the fundus The confidence with which he was pointing out this possible error in spite of his limited experience in smear diagnosis made an impression on me We soon found out that he was right, at least in part, and that the correct diagnosis was an adenocarcinoma of the fundus associated with a pyometra He subsequently confessed to me that, when he first came to our laboratory, he was definitely prejudiced against all efforts to diagnose cancer by cytologic criteria He had been greatly influenced by a distinguished and internationally known pathologist who, in a lecture delivered in Peru some six years ago, had strongly defended the view that there is no such thing as a cancer cell After having examined some of our slides, this young pathologist had realized that the views expressed by the lecturer were rather extreme He no longer doubted that cancer cells though detached and completely isolated, as frequently seen in smears, retain some distinctive traits which make possible their identification as integral parts of a neoplasm

In 1939 I had the good fortune to become associated with Dr Herbert F Traut and later with Dr Andrew A Marchetti, both well trained and experienced gynecologic pathologists Through this association the study of vaginal smears and their application in cancer diagnosis have been put on a more solid basis The work is still being continued at Cornell Medical College and the Woman's Clinic of the New York Hospital under a grant from the Commonwealth Fund as a joint project of the Department of Anatomy under Dr Joseph Hinsey and the Department of Obstetrics and Gynecology under Dr Henricus Stander Dr Traut and I published the results of our studies on the diagnosis of cancer of the uterus by vaginal smear in 1943 in the form of a monograph[5] richly illustrated by Mr Hashime Murayama In this monograph we gave a complete description of the vaginal smear in its use as a diagnostic procedure for uterine cancer and presented a statistical evaluation of 193 instances of carcinoma involving the uterus and some part of

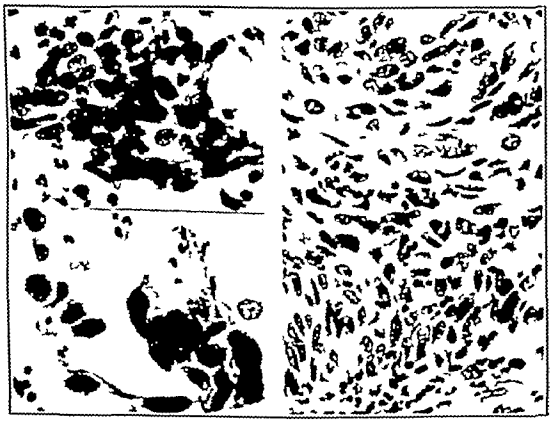

Fig 1—Squamous cell carcinoma of the cervix.

the lower genital tract A total of 127 patients had demonstrable malignant lesions of the cervix In this group, failure to detect the malignant cells in the vaginal smear occurred four times, which gives a percentage of 3 2 In the 53 patients who had primary carcinoma of the fundus the percentage of failure was found to be 9 3 This higher percentage was at least partly due to the relatively high incidence of adenoma malignum, which is more difficult to diagnose because of its slower shedding

Since then Dr Marchetti and I have introduced the endocervical and endometrial smear technic,[6] which has decidedly reduced the chances of overlooking endocervical or endometrial cancers The examination of fluid from the cervical canal and the uterine cavity

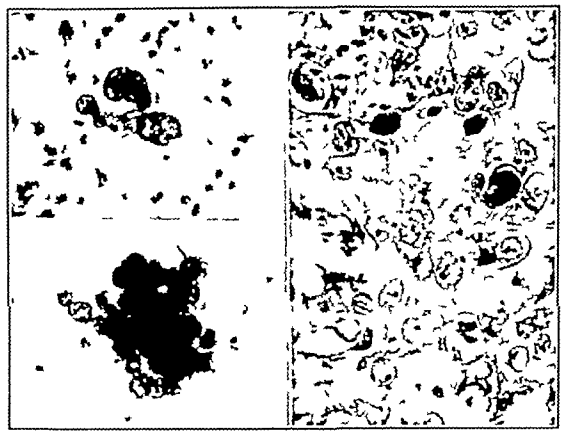

Fig 2—Epidermoid carcinoma of the bladder

is of great value, particularly when an adenocarcinoma of the fundus is suspected Of course the introduction of a cannula into the uterine cavity is not as simple as that of a pipet into the lumen of the vagina, and there are instances in which it is contraindicated In general, however, it is a relatively simple procedure which can be used in most cases without inconvenience to the patient

The value of the endometrial smear is illustrated by the following case studied by Dr Marchetti and me

A woman was admitted to the Woman s Clinic of the New York Hospital on July 26 Vaginal and endometrial smears were prepared Only the endometrial showed abnormal cells suggestive of a malignant process, most likely adenocarcinoma These findings were reported on July 28 A curettage and a cervical biopsy were performed on August 7 They showed normal secretory endometrium and chronic cervicitis The endometrial smears were repeated on August 28 and were again positive A total hysterectomy and bilateral oophorectomy performed on August 30 revealed the presence of a primary adenocarcinoma of the tube.

## DIAGNOSIS BY VAGINAL SMEARS

The publication by Dr Traut and me of our monograph on vaginal smears has created a wide interest in this new approach to uterine cancer diagnosis and has stimulated other investigators to repeat the work and to test its validity Joe Vincent Meigs, Maurice Fremont-Smith, Ruth Graham and their co-workers of Harvard Medical School were the first to conduct a thorough investigation of the test Their observations which are in full accord with the findings reported by us, have been published in a series of articles[7] In a recent paper Meigs, Graham, Fremont-Smith, Janzen and Nelson[8] gave a complete report of 1,015 cases,

with a total error of only 4 per cent They also cite 8 early cases of uterine cancer diagnosed primarily by vaginal smears Three of these were carcinomas in situ In the meantime several other reports have appeared, one by Jones, Neustaedter and Mackenzie[9] of the Post-Graduate Hospital of New York and two by J Ernest Ayer[10] of the Royal Victoria Hospital

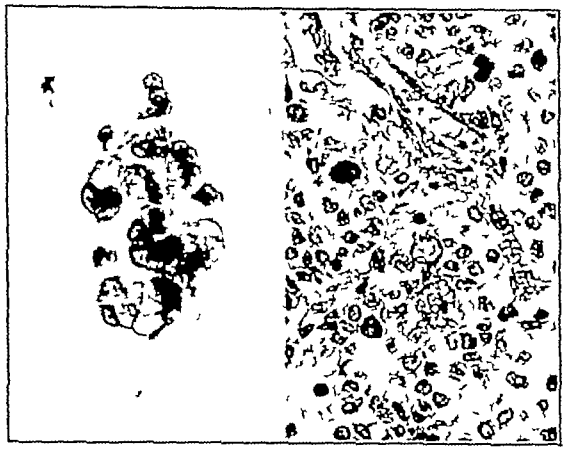

Fig 3 —Bronchogenic carcinoma of the lung

of Montreal All of these confirmed our findings and cited cases in which an early or a primary diagnosis of uterine cancer had been made with the vaginal smear At present many more tests are being conducted in other hospitals in this country as well as in Canada, England and South America

The great simplicity of the test and its low cost have been an inducement to try it as a screening method for detecting early or hidden carcinomas of the female genital tract The attention of public health departments in various states has been called to this possibility, and several investigations are already in progress Among these the studies of the public health departments of the states of New York, Connecticut and Vermont may be mentioned In Massachusetts a thorough and systematic study is now being conducted under the direction of Dr Shields Warren The method has also been introduced and is used routinely in some of the cancer prevention clinics, such as the Strang Clinic of the Memorial Hospital under the direction of Dr Elise L'Esperance

The smear technic is not restricted to the diagnosis of disorders of the female genital system It has been utilized also as an aid in the diagnosis of neoplasms of other systems About a year ago I was greatly impressed by three smears taken at my request from the female urethra by Drs Allister McLellan and J Scott Gardner of the Department of Urology of Cornell Medical College and the New York Hospital The smears of 2 of the patients gave positive and conclusive evidence of carcinoma and that of the third of a sarcoma of the urinary bladder These observations, supported by previous evidence that cells exfoliated from bladder carcinomas can be identified in vaginal smears, led to the decision to investigate the possibility of recovering and recognizing cells or fragments of desquamated cancerous growths of the male and female urinary tract in the sediment of centrifuged urine In a cooperative arrangement with the departments of surgery and urology of our school under the direction of Dr George Heuer and Dr Alexander Stevens, a systematic study of this problem was initiated A preliminary report[11] has already been published by Dr Victor F Marshall of the urology departments of the New York and Memorial hospitals and me This covered 83 cases, 27 of which have been diagnosed as positive for neoplasm on the basis of smears In 24 of these (89 per cent) the smear diagnosis was confirmed by biopsy (21 cases) or clinically (3 cases) In the remaining 3 (11 per cent) the final diagnosis remained obscure One of these 3 cases was originally suspected to be a sarcoma of the prostate An aspiration biopsy of the prostate performed in another hospital several months after the smear examination showed only purulent material Therefore it is possible, though not definite, that our diagnosis in this case was incorrect This would account for one "false positive" in a total of twenty seven positive reports (3 7 per cent) In the group of cases in which the smear was inconclusive or negative, the percentage of correct diagnoses was much lower (about 60)

Since our original report we have tabulated 153 additional cases Thirty-seven of these have been reported as positive for neoplasm on the basis of smears In 34 of the 37 (91 89 per cent) the smear diagnosis was confirmed by biopsy (32 cases) or clinically (2 cases) One (2 7 per cent) has been diagnosed as a papilloma In the remaining 2 cases (5 4 per cent) the final diagnosis still remains uncertain The positive smear diagnosis in these 2 cases was based on the presence of some atypical cells the nature of which is still obscure Many of these cells had multiple nuclei some as many as twenty or more Others showed enlargement of the nucleus and anisonucleosis In the 1 case they were found in urine specimens taken from each of the ureters It is possible that these cells were of histiocytic origin and that we have been wrong in interpreting them as malignant

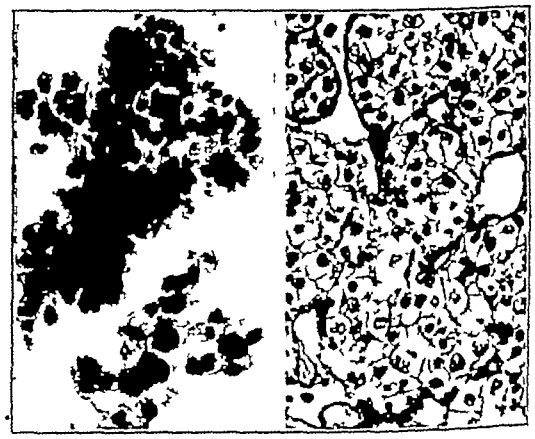

Fig 4 —Clear cell carcinoma of the kidney

In the group of cases in which the smear was inconclusive or negative the percentage of correct diagnoses was 80 However, should all suspected cases in which atypical cells have been found and reported be segregated, the correct diagnosis in the purely negative group would be as high as 93 33 per cent These figures show some improvement over corresponding figures given by Marshall and me[11] in our first report

9 Jones C A Neustaedter T and Mackenzie L L The Value of Vaginal Smears in the Diagnosis of Early Malignancy Am J Obst & Gynec 49: 159 1945

10 Ayre, J E A Simple Office Test for Uterine Cancer Diagnosis Canad M A J 51 17 1944 Ayre J E Bauld W A G and Kearns, P J Test to Show Value of Cervical Cytology Smear in Uterine Cancer Diagnosis Am J Obst & Gynec 50: 102, 1945

11 Papanicolaou, G N and Marshall V F Urine Sediment Smears as a Diagnostic Procedure in Cancers of the Urinary Tract Science 101: 519 1945

Of the 32 correctly diagnosed positive cases there were 17 carcinomas of the bladder, 1 sarcoma of the bladder, 10 carcinomas of the prostate, 3 carcinomas of the kidney and 1 transitional carcinoma of the calix In several of these cases the smear furnished the first positive evidence of malignancy In 1 of these, referred by Dr Howard Jeck of our school, the provisional

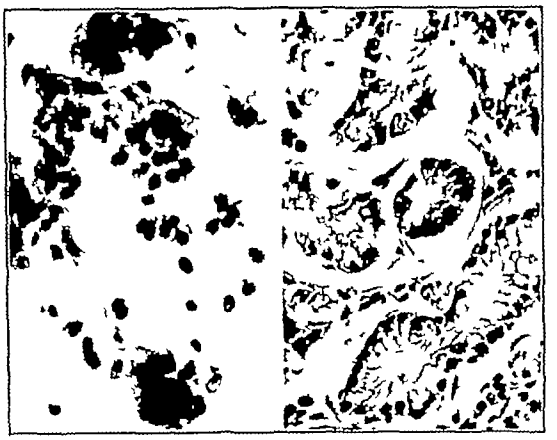

Fig 5 —Mucous carcinoma of the stomach

diagnosis was hypertrophy of the prostate Cancer was not suspected at all The smear was reported as positive, but repeated cystoscopies were negative A subsequent exploratory operation revealed the presence of a carcinoma in a diverticulum of the bladder [12]

In 9 cases of carcinoma of the prostate urine specimens have been examined in the course of estrogenic treatment with or without previous orchiectomy In all but 1 definite cancer cells have been found in the smears In some instances the cells were small, had a dense nucleus and appeared in relatively small numbers In others they were numerous, appearing in large clusters, and showed definite activation of their nuclei and anisocytosis Some cells displayed strikingly aberrant forms and looked like cancer cells enlarged beyond normal limits and remodeled by the prolonged estrogenic therapy The study of these smears is actually fascinating and furnishes convincing evidence of the strong effect of the estrogens on the transitional epithelium of the urinary tract in both men and women An amazing change occurs in the cytology of the urinary smear after an adequate administration of estrogens This modification is comparable to that in the vaginal smear [13] Large acidophilic cells with a pyknotic nucleus and dark cytoplasmic granules, as well as cells loaded with glycogen, become very conspicuous in the smear, while leukocytes show a numerical decrease This change occurs also in smears prepared from the sediment of catheterized urine, as Dr Marshall and I have been able to ascertain which proves that the estrogenic hormone has a stimulating effect not only on the mesodermal and ectodermal epithelia of the uterus, cervix and vagina but also on the endodermal epithelium of the urinary tract The smear technic promises to be of unique value in following the result of various treatments or of irradiation of carcinomas of the urinary tract

Once the door was opened to the use of the smear test for other secretions and fluids, new material, which no longer had to be requested, began to flow into our laboratory Dr Henry Cromwell of Cornell Medical College and the New York Hospital was the first to suggest the use of this technic on sputum and on June 22 he brought us the first specimen This was from an obscure case in which there was a clinical suspicion of cancer of the lung with serosanguineous sputum and suggestive x-ray findings The smears, which were among the first that we had ever prepared from sputum, were not particularly good and disclosed nothing unusual except for one group of cells with enlarged, heterogeneous and hyperchromatic nuclei It was impossible to interpret these as being anything else but a group of malignant cells Bronchoscopy was done by Dr John Kernen and fluid was aspirated, but the findings were negative Bronchoscopy revealed no definite pathologic changes but just slight fixation to the wall of the bronchus A subsequent operation and the biopsy of an excised mediastinal node proved the existence of an undifferentiated bronchogenic carcinoma Since June, more material has been sent to us for study, chiefly from the New York Hospital and the Memorial Hospital through the courtesy of Dr David Barr, Dr Cornelius Rhoads and Dr Lloyd Craver

Up to the present time our experimentation with sputum smears has covered 70 cases Of the 54 which have been completed and tabulated, 22 have been reported as positive for cancer on the basis of smears In 18 of these (82 per cent) the smear diagnosis was confirmed by biopsy or exploratory thoracotomy and in the remaining 4 (18 per cent) by x-ray or other clinical methods The final diagnosis in the 18 confirmed cases was 7 bronchogenic carcinomas, 3 epidermoid carcinomas, 2 metastatic, 1 adenocarcinoma of the right bronchus and 5 moperable carcinomas of the lungs There was no case in which the smear was reported as conclusive for cancer which has been proved to be negative Seven cases have been reported as inconclusive but suspected on the strength of some atypical cells present in the smears Of these, 6 have been proved to be positive by operation or biopsy and 1 remained suspected clinically In the group of 25 cases reported as negative on the basis of smears, 3 (12 per cent) have been shown to present malignant neoplasms of the lungs, 1 (4 per cent) remained obscure and 21 (84 per cent) have been finally diagnosed as negative These results correspond closely to those obtained with urine sediment smears In several instances the sputum smear furnished the first evidence of the presence of a malignant neoplasm Some positive cases showed malignant cells in the sputum smears whereas

*Analysis of Positive Reports Based on Smears*

| | Of Urine Sediment | | Of Sputum | |
|---|---|---|---|---|
| Total number of tabulated cases | 236 | | 54 | |
| Total number of positive reports | 64 | | 22 | |
| Positive pathologically | 56 (87.5%) | 93.75% | 18 (82%) | 100% |
| Positive clinically | 4 (6.25%) | | 4 (18%) | |
| Doubtful | 3 (4.69%) | 6.25% | 0 | |
| Negative | 1 (1.56%) | | 0 | |

12 We recently had a similar case referred by Dr Allister McLellan in which a transurethral prostatectomy had been performed one year before There had never been clinical symptoms of cancer The urine sediment smears were definitely positive A subsequent exploration has shown a small early carcinoma in a diverticulum of the bladder

13 The urine sediment smear is a sensitive and dependable criterion in evaluating estrogenic action In the urine of men the small-nucleated cornified cells are absent and appear only after estrogenic therapy whereas in the vaginal fluid of women they are frequently found under other conditions and are therefore less pathognomonic The glycogenic cells also offer a good criterion as they are rare in the male urine and show decided increase during estrogenic therapy while in the vaginal fluid they are usually present in large numbers.

bronchoscopy and aspiration biopsy were negative One of the patients had three successive aspiration biopsies which were negative The sputum smear was positive and showed "several abnormal cells offering conclusive evidence of malignancy and slight metaplasia," as reported A subsequent exploratory thoracotomy has shown an inoperable cancer of the lung

### PREVIOUS INVESTIGATIONS

When we began our studies on sputum smears for the purpose of recovering and identifying desquamated malignant cells we were not fully aware of the large number of investigations that had previously been conducted on the same problem I have recently made a search of the literature and have found that much has been published on this subject since 1887 [14] The most recent and most complete of these papers is that published in 1944 by H H Wandall [15] of Copenhagen in which he gives the results of sputum examinations for the diagnosis of cancer on 250 patients He used the technic of Dudgeon and Wrigley,[16] which consists in the fixation of the sputum smear in mercury bichloride and in its staining with hematoxylin and eosin He reports an erroneous diagnosis in only 6 of 193 positive cases (a percentage error of 3 1) Our results are in close agreement with his findings

### SMEARS FROM GASTRIC AND OTHER FLUIDS

The group of smears prepared from gastric fluid deserves particular interest Cancer of the stomach is one of the most prevalent forms of all malignant tumors in men and, since it is accessible to surgery, its early diagnosis would be of great help in reducing its mortality I always doubted that cells could be recovered from the stomach in a good state of preservation permitting recognition of their finer structural details Yet in practically all of our smears such cells were well preserved and stained despite their previous exposure to the action of the gastric secretions

So far only 9 cases have been studied, 2 of which were positive and 7 negative It is gratifying to state that all of these have been diagnosed correctly by the smear The 2 malignant cases were an adenocarcinoma of the stomach and a mucous gastric carcinoma The smears of the aspiration fluid showed beautifully preserved cancer cells No aberrant cells have been found in any 1 of the 7 negative cases These observations, though limited in number, demonstrate conclusively that cancer of the stomach can be diagnosed through the identification of cells which have been exfoliated from its surface

Also 4 specimens of aspirated duodenal fluid have been sent to us for study One was from a case of carcinoma of the pancreas with metastases to the mesentery In this specimen the presence of some hyperchromatic and somewhat suggestive cells was noted and reported but the smears were poorly preserved and, in general, inconclusive The other 3 cases were negative

The duodenal smears are remarkable for their unusually low content in exfoliated cells They make a striking contrast to gastric fluid smears, which as a rule contain numerous desquamated cells, many of which are derived from the epithelial lining of the esophagus Occasionally ciliated cells of the respiratory epithelium and histiocytes loaded with pigment like those found in the lungs may be seen in the gastric smear These evidently enter the stomach with mucus which is swallowed

A small number of thoracic and peritoneal fluid specimens have also been sent to us for study Most of these were negative We took an interest in them in that they offered new material for comparison The comparative study of cells representative of different types of malignant neoplasms can be carried out more advantageously in smears when the cells are detached and present themselves to the eye as complete and independent units than in sections in which they lose their individuality and cannot be well visualized outside the pattern of the tissue to which they belong The pathologist is struck more by the differences prevailing in the various types of neoplastic tissues, while the student of smears is apt to pay more attention to certain traits which may be common to different cell types

### TECHNIC

The technic of preparing and staining the smears differs only slightly with the various specimens The vaginal fluid is aspirated with a glass pipet, spread evenly on a slide and fixed immediately in a solution of equal parts of 95 per cent alcohol and ether [5] The endocervical and endometrial fluids are aspirated with a special flexible metal cannula [17]

For the urine tests, approximately 40 cc of urine is considered sufficient Catheterized urine is preferable as it is more cellular and in women it is free from vaginal cells, which greatly confuse the cytologic picture The urine is mixed with 95 per cent alcohol and then centrifuged Smears are prepared from the sediment and fixed in alcohol-ether [11] Gastric aspiration and thoracic or peritoneal fluid specimens are handled in the same way For sputum examinations a specimen after coughing is requested This is fixed immediately in 70 per cent alcohol Smears are made from it and fixed in alcohol-ether

All smears are stained first in hematoxylin and then in OG6 and EA 36, as described in a previous article [18] A good nuclear staining is essential The two counterstains which we use are fairly transparent and give a good differentiation of basophilic and acidophilic cells Eosin is not recommended as a counterstain because it is less transparent and stains all cells uniformly

### DIAGNOSTIC VALUE

The diagnostic value of the smear test is based on the constant exfoliation of malignant neoplasms having a free surface This could be compared to a curettage that nature keeps on performing continuously The cells become detached either singly or in clusters Therefore the criteria in smear diagnosis are not entirely cytologic, as some persons believe Small fragments of tissue in the form of cell clusters are found frequently in cancer smears When present they indicate exfoliation and help greatly in the diagnosis In most instances one can rely more on such fragments, which retain some of the structural characteristics of the neoplasm, than on individual cells

The size and form of the nucleus are most significant In the malignant cell the nucleus tends to be unusually large in proportion to the size of the cell It also tends to grow far beyond normal limits and to acquire atypical forms Its structure assumes a characteristic

18. Papanicolaou G N A New Procedure for Staining Vaginal Smears Science 95: 438 1942

pattern with intensely stained granules or small clumps of chromatin and a distinct network of filaments centering in the nucleoli Some nuclei show changes suggestive of an early prophasic stage Actual mitoses are rather rare, though they may occasionally appear in relatively large numbers Nuclei are often hyperchromatic or degenerated Degenerating nuclei may lose entirely their finer structure and stain almost black The nucleoli show considerable variability In certain types of cancer they are large and conspicuous, in others less prominent The nucleus often shows atypical and unequal fragmentation resulting in the not infrequent appearance of binucleate or multinucleate cells

The cytoplasm in the undifferentiated cancer cell is rather basophilic, but in some differentiated cells, like those found in squamous cell carcinomas of the cervix or of the lungs, it is strongly acidophilic An abnormal vacuolation is not rare, particularly in adenocarcinomas Sometimes the vacuoles contain a mucoid substance or are infiltrated by leukocytes, monocytes or other small cells The inclusion of one cell into another is not unusual and gives the impression of a phagocytic process It might be attributed to the high proliferative activity of the cells and to their crowding, which cause one cell to be pressed into another

The form of the cancer cells depends on the prevailing type of cancer Whereas the nucleus tends to show uniform and comparable changes in all types of malignant neoplasms, the cell as a whole largely retains its individuality and its specific form In the undifferentiated types it has the primitive round or oval form of the embryonic cell In the differentiated types it preserves much of the distinctive form of the tissue from which it draws its origin However, this does not apply to all cells Many show deviations from the normal and acquire atypical and sometimes entirely monstrous forms Such monstrosities are often seen in squamous cell carcinomas of the cervix

When cancer cells appear in clusters they offer additional criteria One of these is crowding, which has a definite diagnostic value The cells overlap and are so densely arranged that it is impossible to focus them in one plane The crowding of the cells is more apparent in fragments of the tumor found in smears than in sections of the tumor itself Anisocytosis and anisonucleosis are also very significant and not infrequent

The diagnosis of cancer by smears should be based on strong and substantiative evidence offered by sufficiently pathognomonic cells and cell groups One should refrain from reaching a final conclusion on the strength of only a few cells The failure to detect malignant cells in the smear of a positive case is in a way excusable, but the wrong interpretation of findings is apt to be severely critized and to cause serious doubt as to the accuracy and dependability of the test

A failure may sometimes be due to the insufficiency or poor preservation and staining of a specimen or to the absence of characteristic cells in the smear because of the deficient shedding of the tumor In 1 case of carcinoma of the kidney the examination of the urine for cancer cells was negative in seven out of nine tests

When findings are inconclusive the test should be repeated whenever possible One of the greatest advantages of this method of diagnosis is its technical simplicity, which permits repeated examinations without much inconvenience or expense In the positive cases one test is, as a rule, sufficient

## ADVANTAGES AND DISADVANTAGES OF TEST

The smear, like any other test, has its distinctive advantages and disadvantages These may be objectively summarized as follows Among the advantages of this method one should mention First, its simplicity and inexpensiveness Second, its reliability in the hands of experienced men Third, that it permits the early recognition of incipient cases or of hidden carcinomas such as carcinomas in situ, this is because aberrant cells become exfoliated from the surface of a cancerous growth even before it is ulcerated Fourth, that it can be carried out on a large scale as a screening method Fifth, that it does not conflict in any way with other well established methods of pathologic diagnosis such as biopsy or curettage, being, on the contrary, a valuable complement to them as it covers a larger area than they do Sixth, that it may eventually reveal the presence of cancer where biopsy has failed,[19] although it may occasionally fail in its turn to show an existing cancer proved by biopsy Seventh, that it is of unique value in following up the result of operative procedures or the progress of irradiation or other therapy All these points have been amply supported by conclusive evidence

Its main disadvantages are the following First, its criteria are not yet clearly outlined and need to be further standardized Second the type and origin of the malignant cells are not always clear, some cells retain their original pattern, while others lose it beyond possible identification Third, it does not show the grade of malignancy, although it may occasionally give some hint as to the prognosis Fourth, it does not supply information as to the mitotic activity of the malignant growth or its relationship to the adjoining normal tissues Fifth, the average time required for the examination of a smear is somewhat longer than that required for a pathologic section

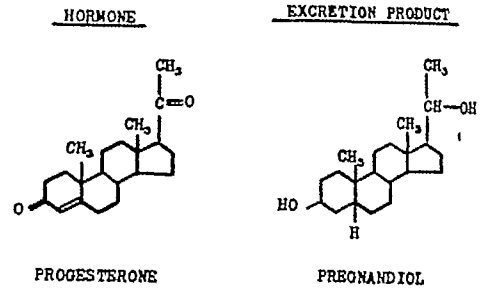
## COMMENT

The idea of studying the exfoliated cells in various secretions of the body is not new The vaginal fluid was examined for the first time almost a hundred years ago by Pouchet[2] and the sputum some sixty years ago by Hampeln[14] Examination of urine and of thoracic and peritoneal fluids has been a routine procedure for a long time in pathologic laboratories Many investigators have worked on the possibility of applying such examinations to the diagnosis of cancer, and their results have been published in a large number of papers Since our note on the "urine test" has appeared, I have received several letters from men who at one time or another had succeeded in diagnosing malignant neoplasms through the identification of exfoliated cancer cells in the urine

Why were not the apparent potentialities of this diagnostic procedure fully appreciated much earlier? Is it because of the widely prevailing opinion that a malignant tumor cannot be safely diagnosed except by biopsy? Is it because of the discouragement of some investigators by diagnostic errors which occurred during the early stages of their experimentation or by the

19 A recent case may serve as an illustration of this point A woman aged 42 was admitted to the New York Hospital on Sept 7 1944 with a provisional diagnosis of right ovarian cyst Vaginal and endocervical smears showed evidence of a malignant neoplasm Because of these findings the endometrium was curetted on September 9 and a biopsy of material from the cervix made September 23 The findings were inconclusive Frequent examinations in the clinic were all negative On Dec 5 1945 a second biopsy was performed and revealed the presence of an intraepithelial carcinoma fully fifteen months after its first diagnosis by smears

strong opposition which they have encountered? Or is it because of an inefficient and inadequate technic? The last reason appears to be more likely, though other factors must have contributed. A good fixation and a good staining of the cancer cells are of paramount importance in this cytologic method of diagnosis.

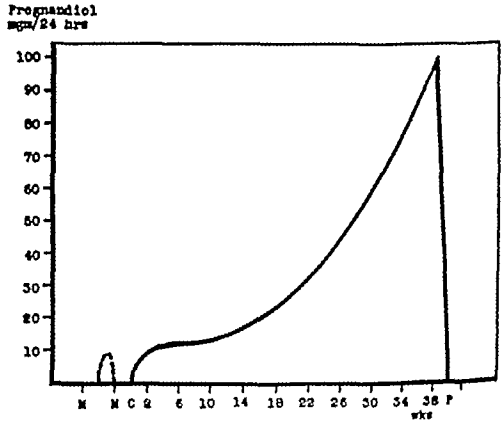


I fully realize that the report which I have given is fragmentary and incomplete. This is because in this new and vast field of research the work which we have done so far is still incomplete and fragmentary. It will take many years before all the aspects and potentialities of this new diagnostic approach have been thoroughly explored. However, much has already been accomplished. The soundness, reliability and practical value of this method of pathologic diagnosis have been well established and are now more generally recognized. Its specific advantages and its superiority in some respects over other diagnostic procedures are apparent and are no longer disputed. Having devoted a large part of my scientific endeavors to the establishment of this method as an instrument of research and diagnosis I may be allowed to assert my absolute faith in it and my strong belief that it will eventually prove to be as stimulating and productive in the field of cancer cytology and cancer diagnosis as it has been in the realm of experimental and human sex physiology and endocrinology.

## PREDICTION OF FATE OF THREATENED ABORTION BY PREGNANDIOL

HENRY S GUTERMAN M D
Chicago

It has been shown in this laboratory that the determination of pregnandiol excretion in urine (by a qualitative color reaction) can be used as a diagnostic test for pregnancy, with an accuracy similar to that obtained with the Friedman (rabbit) procedure.[1] Recently we have been following, by means of the color test the excretion of pregnandiol in complications of pregnancy, particularly in threatened abortion. It will be demonstrated in this report that the pregnandiol color test can be used to predict with a large degree of accuracy the fate of a threatened abortion, and that it can thus serve as a prognostic guide for the physician.



Pregnandiol is a biologically inactive steroid found in the urine of women. On the basis of the following considerations it is generally accepted to be the urinary excretion product of progesterone a hormone secreted by the corpus luteum and/or the placenta. 1. Coincident with the period of corpus luteum function pregnandiol is present in the urine of women in the latter half of the menstrual cycle until one to four days before the onset of the flow.[2] 2. When fertilization occurs and normal pregnancy follows, the corpus luteum persists and pregnandiol excretion continues.[3] 3. Furthermore, when large amounts of progesterone are administered to men or women (normal, hysterectomized and/or oophorectomized) pregnandiol appears in the urine.[4] The structural similarity between progesterone and pregnandiol is illustrated in the structural formulas.

Chemical structure of progesterone and pregnandiol. The conversion of progesterone to pregnandiol involves the addition of two hydrogen atoms at each double bond.

Pregnandiol studies in normal pregnancy reveal a definite pattern of excretion despite quantitative variations in individual cases as shown in the chart. In early pregnancy urinary pregnandiol excretion continues at about the maximum level reached during the latter half of the normal menstrual cycle. Between the ninth and the twelfth week the amount of pregnandiol appearing in the urine begins to rise sharply and reaches a maximum level about two to three weeks before delivery. From this peak the excretion decreases sharply, and pregnandiol disappears from the urine twenty four to forty-eight hours after delivery.[5]

Venning and Browne believe that the corpus luteum secretes progesterone during the first two months of pregnancy. Regression of the corpus luteum of pregnancy in the third month of gestation coincides with increasing levels of pregnandiol excretion. They conclude that the placenta probably assumes the function of secreting progesterone at this stage.[3] When parturition approaches, the secretory activity of the placenta decreases and pregnandiol levels fall.

A schematic illustration of the pattern of pregnandiol excretion in the normal menstrual cycle and normal human pregnancy. *M* menses *C*, conception *P*, parturition.

The symptoms of threatened abortion occur most frequently in the third month of human gestation

From the Department of Metabolic and Endocrine Research Research Institute Michael Reese Hospital.

The Department of Metabolic and Endocrine Research is in part supported by the Michael Reese Research Foundation.

This work was aided by a grant from the Committee on Scientific Research of the American Medical Association to Dr. Rachmiel Levine.

Dr. Rachmiel Levine director of the Department of Metabolism and Endocrinology, gave aid and encouragement in this work. Technical assistance was given by Miss L. Marquardt Miss M. Weichert and Mrs. E. F. Hirsch. Drs. B. I. Coopersmith Richard Frank and Simon Cideon cooperated in providing the greater part of the clinical material for study.

Browne, Henry and Venning [5] pointed out that this corresponds to the period when secretory function is being transferred from the corpus luteum to the placenta. They postulated that failure to maintain progesterone secretion during this transition stage may be the factor responsible for abortions occurring in the first trimester. Studying pregnandiol excretion (as an index of progesterone elaboration) in cases of threatened abortion, these authors showed that the persistence of pregnandiol in the urine during the symptom period was associated with the resumption of a normal course of pregnancy. If pregnandiol dropped to a low level or disappeared from the urine, abortion followed.[5] Similar observations have been made by other investigators.[6]

This information, if correct, would provide the physician with a prognostic guide in evaluating a case of threatened abortion. However, the methods usually employed in determining pregnandiol gravimetrically are not practical for routine clinical use. They are time consuming, require skilled technical help and employ large volumes of urine.

Hamblen, Cuyler and Baptist,[7] in their report on pregnandiol determinations find that the delay imposed by such a prolonged determination renders the data "of no practical or constructive import."

In 1944 this laboratory reported a rapid simple method for the determination of pregnandiol which is practical for clinical use. In this procedure a color reac-

tion occurs when concentrated sulfuric acid is added to the pregnandiol extracted from urine (pregnandiol color reaction) [8]

On the basis of the report of Browne, Henry and Venning [3] and a few of our own observations [8] the study of the pregnandiol excretion of threatened abortion by means of the pregnandiol color reaction was extended to ascertain whether it could be used to establish the prognosis in such cases Employing the pregnandiol color test routinely to predict the course of threatened abortion, my associates and I have found it accurate, reliable and practical in the 73 cases studied to date

## METHOD

First morning urine specimens from pregnant women who complained of both abdominal cramps and vaginal spotting or bleeding were examined for pregnandiol Whenever possible daily urine samples were tested

The pregnandiol color reaction technic employed in this study was detailed previously [8] The procedure is simple and requires two and a half to three hours to complete Four to six tests can be carried out simultaneously by one person The chemicals are inexpensive The equipment is standard in clinical laboratories

The pregnandiol color test is read as "positive" when a deep yellow to orange or orange-brown develops A colorless or pale yellow final solution is considered "negative" The minimal "positive" color (deep yellow) represents 0 4 mg of pregnandiol per hundred cubic centimeters of urine (the volume employed in each test) or the excretion of 6 to 10 mg in twenty-four hours [9] The latter figure represents the excretion of pregnandiol in early normal pregnancy

In each case studied the physician was notified whether or not the patient excreted pregnandiol, and a tentative prognosis was made on this basis The ultimate clinical fate in each case was then compared with the prognosis made in the laboratory

## RESULTS

Table 1 lists the pertinent clinical data, the pregnandiol color reactions, the tentative prognosis and the clinical results in the 73 cases studied The cases are divided into four groups according to the mode of pregnandiol excretion In groups 1 and 2, in which the pregnandiol color reaction was persistently "positive" or became "positive," the symptoms of threatened abortion subsided and pregnancy continued normally In groups 3 and 4, in which the pregnandiol color reaction was persistently "negative" or became "negative," the patients aborted The prognosis indicated by the pregnandiol color reaction coincided with the clinical results in 68 of the 73 cases studied, indicating a correct correlation in 93 per cent of the cases

Table 2 summarizes the results obtained in this group of 73 cases studied to date In 39 cases the pregnandiol color reaction was persistently "negative" or became "negative," thereby indicating to us a poor prognosis or inevitable abortion Thirty-eight patients in this group went on to abort, and 1 resumed a normal course of pregnancy

The color reaction was persistently "positive" or became "positive," indicating to us a good prognosis, in 34 cases In 30 of these patients the symptoms of threatened abortion subsided and pregnancy resumed a normal uneventful course Thus the pregnandiol color reaction predicted correctly the course of 38 of the 42 patients who did abort. In the group that did not abort, prediction by the pregnandiol color reaction was correct in 30 of the 31 cases studied The correlation between the pregnandiol color reaction and clinical course of 73 pregnant patients threatened with abortion is 93 per cent correct.

In 5 cases the prognosis based on the pregnandiol color reaction did not coincide with the clinical result Four patients (4, 14, 20, 25) aborted although the pregnandiol color tests were "positive", 1 patient (57) did not abort in spite of persistently "negative" color reactions

In the former group a diagnosis of placenta previa was made in cases 4 and 14 A large fibroid contributed to the abortion in case 25 It is fruitless to employ a hormone function test to evaluate the clinical status of a threatened abortion if the etiology is nonhormonal

In the same group the symptoms of threatened abortion occurred in the fifth month of gestation in cases 14 and 20 From the chart it is seen that the excretion of pregnandiol is much greater in the fifth month of normal pregnancy than in the first three months The minimal "positive" color reaction represents an excretion of 6 to 10 mg in twenty-four hours, the average range for pregnandiol values in the first trimester Pregnandiol excretion in the fifth month normally ranges from 22 to 52 mg in twenty-four hours [3] Thus, if the abortion threat occurs after the first trimester it is possible for the pregnandiol excretion to decline from 50 or more mg in twenty-four hours to 10 mg in twenty-four hours in a short time with the color test being still read as "positive" in each test Quantitative estimations of pregnandiol are therefore necessary after the first trimester of pregnancy to ascertain the trend of excretion in predicting the course of threatened abortion For this reason my associates and I are adapting the pregnandiol color reaction for quantitative estimation by a colorimeter

For the patient (57) who did not abort in spite of persistently "negative" color reactions there is no explanation at present for the low pregnandiol excretion A few "negative" color reactions have been encountered in early normal pregnancy [9] The urine in case 57 gave a strong "positive" color reaction in the seventh month of pregnancy

After thus analyzing these 5 cases it is felt that cases 4, 14 and 25 should not be included as errors of prognosis on the part of the pregnandiol color reaction Also special consideration should be given case 20, with judgment reserved until the quantitative modification has been applied

The accuracy of 93 per cent in the series reported is uncorrected Even without correcting the data, the pregnandiol color reaction demonstrated a high degree of accuracy in predicting the course of threatened abortion

TABLE 2—*Summary of Results*

| Final Color Reaction | Number of Cases | Clinical Result: Abortion | Clinical Result: Normal Delivery | Percentage Correlation |
|---|---|---|---|---|
| Negative | 39 | 38 | 1 | 97 |
| Positive | 34 | 4 | 30 | 88 |
| Total | 73 | 42 | 31 | 93 |

The final pregnandiol color reaction formed the basis of prognosis and is correlated with the clinical results

COMMENT

The pregnandiol color reaction, applied to predicting the course of threatened abortion, formed the basis of a correct prognosis in at least 93 per cent of the 73 cases studied These data corroborate the results of Browne, Henry and Venning[5] as well as those of others[6] who demonstrated by a complicated procedure the relationship between the trend of pregnandiol excretion and the fate of threatened abortion due to endocrine factors

Our method of determining urinary pregnandiol is a practical, reliable and accurate aid in predicting the course of threatening abortion The results of the pregnandiol color reaction are conveniently available to the physician the same day the specimens of urine are sent to the laboratory for analysis The prognosis is established in a few days by the indicated trend of excretion The physician thus has available an objective guide in evaluating a particular case of threatened abortion

The etiology of threatened abortion is varied Failure of maintained progesterone secretion is only one of the endocrine factors involved, for the pattern of estrogen excretion in threatened abortion is similar to that of pregnandiol excretion[10] It is possible that the secretion, metabolism and/or excretion of steroids in general depend on similar processes in normal pregnancy, abortion and parturition The practical, routine clinical applicability and the observed accuracy demonstrate the advantages of the pregnandiol color test over other procedures available at this time

It is important to eliminate anatomic or mechanical contributions to abortion by careful physical examination Failure to observe this precaution may lead to unjustified and needless use of pregnandiol determinations Pregnandiol excretion is an index of progesterone secretion and cannot be relied on to detect a placenta previa, fibroid or bleeding cervical polyp (see cases 4, 14 and 25 of the present series)

The large majority of threatened abortions occur in the first trimester of pregnancy "Positive" color reactions in this period of normal pregnancy are usually deep yellow, indicating the excretion of 6 to 10 mg of pregnandiol in twenty-four hours "Positive" qualitative color reactions are not applicable in cases of threatened abortion occurring later than the first trimester, as explained earlier Infrequently the excretion of pregnandiol is greater than 10 mg in twenty-four hours in the first three months of pregnancy These contingencies point to the necessity for quantitative estimations of the pregnandiol color reaction if it is to be applied in all stages of pregnancy Case 38 indicates the advisability and usefulness of such a procedure The trend of decreasing pregnandiol excretion, and thus the correct prognosis, was established by quantitative spectrophotelometric studies in spite of persistently "positive" color reactions The color reaction is now being adapted for quantitation to a colorimeter frequently employed in clinical laboratories, without complicating or unduly prolonging the procedure

The data in table 1 reveal that prognosis was made in half of the cases on the basis of single tests This was necessary because only single urine specimens were available It is advisable to establish the trend of pregnandiol excretion by serial determinations as the basis of prognosis

It appears then, from these considerations and from the data obtained, that the pregnandiol color reaction is an accurate prognostic guide in threatened abortion It can be applied as a routine clinical test The information supplied should obviate unnecessary therapy or anxiety when the pregnancy has failed or hormonal secretion is normal

SUMMARY

1 By means of a simple color reaction for urinary pregnandiol, the excretion of this hormone derivative was studied in 73 cases of threatened abortion

2 It was found possible to predict accurately the outcome of a threatened abortion by means of this test in 93 per cent of the cases studied (68 cases out of 73)

3 In threatened abortion (which is not due to mechanical factors) the continuing excretion of pregnandiol indicates that the particular pregnancy will be retained

4 However if pregnandiol is not excreted or the excretion diminishes during the course of observation the abortion becomes inevitable

5 Pregnandiol excretion measurements by means of the simple color test are of value in the prognosis of the fate of threatened abortion

## MUMPS INVOLVEMENT OF THE CENTRAL NERVOUS SYSTEM

CAPTAIN EUGENE M HOLDEN
CAPTAIN ARCHIE Y EAGLES
and
CAPTAIN JOHN E STEVENS Jr
*Medical Corps Army of the United States*

It is of obvious military importance to recognize early the true nature of any meningeal infection in a large group of military personnel Likewise, in civilian practice the early knowledge of the exact nature of a meningeal involvement may prove to be of the utmost importance in treatment though possibly not involving as many important epidemiologic consequences as when encountered in the military services The possibility of mumps meningoencephalitis, which may occur prior to or in absence of the usual manifestations of mumps, is often overlooked in the differential diagnosis of cases showing signs of meningitis One reason why this entity is frequently overlooked is the prevalent idea that mumps is primarily a disease of the parotid glands which on occasion is accompanied by secondary involvement of the gonads and central nervous system It is becoming realized more and more, however, as pointed out by Wesselhoeft,[1] that mumps is basically a systemic disease which has a special predilection for the salivary glands, mature gonads, pancreas and breasts While few would support the hypothesis of Philibert[2] which states that mumps is primarily a disease of the central nervous system, the frequency with which clinical or subclinical involvement of the central nervous system occurs in the course of mumps is generally not recognized and thus is deserving of special emphasis

In reviewing the available literature, one finds that the reported incidence of mumps meningoencephalitis

1 Wesselhoeft C. Medical Progress Mumps, New England J Med. *226: 530 (March 26) 1942*

2 Philibert A. Nouvelle conception de la pathogénie des oreillons, Progrès med Jan 23 1932 p 145

varies greatly This lack of agreement is partially due to the fact that some authors report only the clinically recognized cases of central nervous system involvement while others report cases in which they use the spinal fluid pleocytosis as the prime criterion for diagnosis On the basis of clinical signs alone Radin,[3] in a careful analysis of 5,756 cases of mumps at Camp Wheeler, and Brooks,[4] in a study of 1,059 cases at Camp Upton, reported none complicated by meningoencephalitis, on the other hand de Massary [5] found 16 cases in a group of 635 and Steinberg [6] found 10 cases in a group of 165 which showed clinical signs of meningoencephalitis Using the pleocytosis of the spinal fluid as the criterion of central nervous system involvement, Dopter [7] had suggested that there is no increase in the spinal fluid cell count in clinically uncomplicated mumps However Lavergne [8] showed pleocytosis in 4 of one group of 17 mumps contacts and 4 in another group of 25 contacts In 3 from the second group he demonstrated the virus by intrathecal inoculations in rabbits Likewise Monod [9] found an increase of spinal fluid cells in 6 of 8 cases of fully developed mumps, Candel [10] in 30 of 38 cases, Finkelstein [11] in 16 of 40 cases, Teissier [12] in all of 20 cases and de Massary [5] in all of 40 cases One of the more recent reports by McGuinness and Gall [13] of an epidemic at Camp McCoy, Wisconsin, during the fall and winter of 1942-1943 records 55 cases among 1,378 in which "involvement of the central nervous system was either suspected or known to be present" Of these 55 cases, spinal punctures were done in 19 and an increased number of cells was found in 16 In view of the wide variation of the reported incidence of clinical meningoencephalitis and the lack of correlation between clinical and laboratory evidences thereof, additional data as to what percentage of routine mumps cases show subclinical involvement of the central nervous system are obviously desirable

However, when discussing the subclinical involvement of a system by a specific organism it is necessary to have some method of proof of the nature and identity of the suspected pathogen Until recently there was no practical laboratory method of differentiating the clinical or subclinical cases of mumps meningoencephalitis from others in that large and heterogeneous group which presents the clinical syndrome of "acute aseptic meningoencephalitis" Previously, in order to make a positive diagnosis of mumps meningoencephalitis, the virus itself had to be isolated from the spinal fluid by animal inoculation Lavergne [8] was one of the first to accomplish this by intrathecal inoculation of the rabbit with the suspected material Since the important contribution of Enders and his co-workers [14] in the development of the complement fixation test for the serologic diagnosis of mumps, the problem of differentiating the central nervous system involvement due to mumps from that of lymphocytic choriomeningitis, poliomyelitis and the encephalitides due to the other viruses is much simplified With use of an antigen consisting of a dilute suspension of heat-inactivated virus from infected monkey parotid glands, the complement fixing antibodies in the serum or spinal fluid are checked during the disease and again in convalescence If there is any rise in titer this is interpreted as showing that the patient has been exposed to the virus and has developed the specific antibodies during the course of the disease A dermatologic sensitivity test has also been developed by the same authors [15] with the same antigen, but the practical diagnostic value is often limited, owing to the frequently delayed dermal response to the infection, the interval varying from several days to three months Even more recently, Habel [16] has been able to grow the mumps virus in the developing chick embryo and has shown that the serologic tests are just as effective when the antigen is derived from this source The more accurate diagnosis of mumps meningoencephalitis,

Distribution of white blood cells

with or without salivary gland involvement, should result from the increased knowledge and use of these serologic tests

## METHODS OF STUDY

In order to determine the true incidence of clinical and subclinical involvement of the central nervous system in clinically proved cases of mumps, we have studied 100 consecutive hospitalized patients, each receiving a diagnostic spinal puncture on the fourth day of his disease At this time his drowsiness, headache, cervical rigidity temperature and general toxicity were evaluated to establish or rule out the presence of a clinical meningoencephalitis If any patient showed any additional significant signs after the fourth day, the spinal puncture was repeated and the more abnormal findings were used in our statistics This occurred in only 3 instances, with the highest rise being from 16 cells to 200 cells The criteria of central nervous system involvement were based on three factors (1) clin-

* Cases also carried in table 3

above per hundred cubic centimeters.[17] Since the maximum level of total protein accepted by some authorities[18] varies from 15 to 40 mg., we also tabulated those cases with a total of 20 mg. per hundred cubic centimeters or over. Using these criteria as the basis, we divided the cases into two groups (*a*) the recognized cases of meningoencephalitis and (*b*) the subclinical cases which were asymptomatic but showed either or both pleocytosis and increased total protein.

## RESULTS

From the 100 cases 33 fell into the first group, and these data are summarized in table 1. The total spinal fluid cell count varied from 0 to 900, when cells were present the percentage of lymphocytes was always extremely high. The clinical signs are tabulated in degrees of severity, and it is easily noted that there is no correlation between these and the height of the cell count. In fact, in the last 5 cases a normal number of cells were present in the spinal fluid and yet there were signs of moderate to severe meningeal

TABLE 3.—*Cases of Subclinical Meningoencephalitis as Shown by Pleocytosis of 10 Cells or More*

involvement. Not one of these patients was critically ill at any time, but the occasional extreme toxicity of this group is not to be minimized.

In table 2 are summarized the data on 8 subclinical cases with increased spinal fluid protein. Taking 30 mg. of protein per hundred cubic centimeters as the upper limit of normal, one finds 8 cases with protein ranging from 30 to 75 mg. per hundred cubic centimeters. It will again be noted that there is no correlation in this group between the number of cells and the amount of the protein in the spinal fluid. Table 3 shows 4 cases with 10 or more cells in the spinal fluid but without clinical signs of central nervous system irritation. Attention is drawn to the fact that 2 of these cases are presented in both of the latter tables. In summary, there are 10 cases of subclinical mumps meningoencephalitis and 14 others which could be called borderline with elevation of total protein to 20 mg. per hundred cubic centimeters.

Although our primary purpose in this article is to stress the frequency of the involvement of the central nervous system, several points of general and epidemio-

17. Simmons, J. S., and Gentzkow, C. J.: Laboratory Methods of the United States Army, ed. 5, Philadelphia, Lea & Febiger, 1944, p. 92. Todd, J. C., and Sanford, A. H.: *Clinical Diagnosis by Laboratory Methods*, ed. 10, Philadelphia, W. B. Saunders Company, 1943, pp. 598 and 607.

18. Kracke, R. R., and Parker, F. P.: Textbook of Clinical Pathology, ed. 2, Baltimore, Williams & Wilkins Company, 1940, pp. 496 and 504.

logic interest we believe are worthy of presentation These patients were admitted to this hospital from the whole population of the post, but by far the great majority originated from the Negro reception center and the special training units to which the recent inductees were assigned The patients from this source had all had recent induction examinations to rule out central nervous system syphilis, and none of our cases gave a positive spinal fluid Wassermann reaction Analysis of the general statistics reveals that 92 per cent of this series were Negroes and 90 per cent were in the age group of 18 to 26, with the average age being 22 27 years The average duration of service was 5 22 months, but the distribution is best shown by table 4

An effort was made to discover any possible correlation between the severity of the salivary gland involvement the presence of orchitis and the presence of meningoencephalitis In the series of 100 cases there were 68 cases of bilateral and 32 of unilateral salivary gland involvement, the latter affecting the right and left sides with equal frequency The incidence of epididymo-orchitis was 11 per cent, 6 on the left, 4 on the right and 1 bilateral

The lack of correlation of the occurrence of central nervous system involvement with the degree of salivary swelling or orchitis is easily noted from the tables

The total white blood cell count was usually between 5,000 and 5,490, the exact distribution is shown in the chart The differential count showed a slight decrease in the number of neutrophils, but no other significant alteration was noted No correlation between the severity of the disease in any of its manifestations and the white blood cell count was found

### CONCLUSIONS AND SUMMARY

In 100 consecutive hospitalized mumps cases a study was made in an effort to determine the incidence of clinical and subclinical involvement of the central nervous system by the mumps virus

1 Thirty-three cases showed clinical signs of meningoencephalitis, 28 of these showed abnormal spinal fluid

2 Ten cases presented evidence of subclinical involvement of the central nervous system 8 increased spinal fluid protein to 30 mg per hundred cubic centimeters or over, 4 pleocytosis of 10 cells or more per cubic millimeter and 2 both abnormal total protein and pleocytosis

3 There was no correlation between the occurrence of central nervous system involvement, the severity or number of salivary glands involved or the presence of epididymo-orchitis

4 Mumps meningoencephalitis is fast becoming a well known entity which can be definitely diagnosed with the aid of the newer serologic tests The exact diagnosis by these methods is frequently of the utmost importance in the absence of salivary gland involvement

## CORONARY THROMBOSIS

RALPH L. FISHER, M D
and
MORRIS ZUKERMAN, M D
Detroit

A review of 108 cases of coronary thrombosis served as the basis for the material presented in this article Of the 108 patients 57 were known to have died and 51 were considered as follow-up patients The latter group consisted of two divisions those who had made regular visits to the outpatient department and those who had not been seen or heard of since their last visit to the outpatient department Questionnaires were then sent to the latter patients to determine the status of their health The final results of this questionnaire showed that 26 patients were still living, 77 were deceased and the status of 5 is unknown

The history of medically classified cases of coronary thrombosis is a relatively short one The first case of coronary thrombosis was recognized and proved at autopsy by Hammer[1] in 1876 In 1912 J B Herrick[2] described the classic picture of acute obstruction of the coronary arteries It was after Herrick's second publication in 1919 that the recognition of the clinical entity of coronary disease became widespread

### AGE OF INCIDENCE

A review of the age of onset of coronary occlusion clearly points to the fact that this condition appears in variable age groups The average age at the time of onset of the illness was found to be 57 6 years in the reviewed patients The youngest patient observed was 37 years of age and the oldest was 84

### TYPE OF ONSET

There were 79 instances in which the coronary occlusion took place suddenly and required that a physician be called immediately There were 36 instances in which variable time intervals elapsed from the time of the onset of the acute occlusion until the diagnosis was made The diagnoses in these cases were made by history, electrocardiographic reports and physical findings From this we might conclude that many cases of coronary thrombosis are never diagnosed and yet are entirely compatible with life

### SEX INCIDENCE

In our study there were 79 males and 29 females, giving 73 14 per cent males as compared with 26 85 females This gives a ratio of 2 72 males to 1 female

Smith, Sauls and Ballew[3] analyzed 100 cases of coronary occlusion with reference to sex incidence Of their 100 patients 15 were females, the ratio being 6 6 males to 1 female The ratio usually given in the entire literature is 3 to 1 However, some authors have reported as high as 13 to 1

Falk[4] declared that coronary disease is four to six times more prevalent among men than among women No definite explanation for this difference has been

From the Department of Internal Medicine Alexander Blain Hospital The authors are now of the Department of Internal Medicine, Riverside Clinic.

ascertained, however, as a hypothesis it has been suggested that, as a result of woman's child bearing capacities, nature has given her a cholesterol clearing mechanism which may be an important protective factor against coronary disease Fellner,[5] reporting his findings in autopsies on arteriosclerotic subjects, observed that, as a rule, women developed arteriosclerosis later in life than men and that they also suffered a milder form of the disease

TABLE 1—*Patients Classified on the Basis of Nationality*

| Americans | 62 | Irish | 3 | Rumanian | 1 |
| Germans | 8 | Swedish | 2 | French | 1 |
| Italians | 5 | Russian | 2 | Jewish | 1 |
| English | 5 | Syrian | 2 | Dutch | 1 |
| Polish | 4 | Danish | 1 | Scotch | 1 |
| Canadian | 4 | Greek | 1 | Austrian | 1 |

Three patients not classified

### NATIONALITY INCIDENCE

In a practice such as the one from which these cases were taken, multiple nationalities were presented The figures given in table 1 indicate that nationality is not an important predisposing factor Bearing in mind that our patient population is predominantly American, this cross section would seem to indicate that no one nationality group is predominantly afflicted with coronary occlusion

### WEIGHT OF PATIENTS

It has been stated that the patient s body build is an etiologic factor in coronary occlusion[6] The heavy set overweight, frequently athletic person is more susceptible to this disease than is the normal or underweight person Levine[7] feels that those who are underweight and in good health at the age of 40 have a better expectancy than the average, normal weight person In a series of 100 cases reported by Smith, Sauls and Ballew[3] 35 per cent of the patients were obese, while malnutrition occurred in only 4 per cent of the group

In analyzing the weight of the reviewed patients, the results presented in table 2 were noted

### EFFECT OF ALCOHOL AND TOBACCO

Smith, Sauls and Ballew,[3] in discussing the habit excesses of their patients, noted that smoking played an inconclusive part in coronary occlusion Seventeen per cent of their patients smoked excessively, and 12 per cent did not indulge in the use of tobacco at all

TABLE 2—*Weight of 108 Patients*

| | Total | Male | Female |
|---|---|---|---|
| Obese | 49 | 36 | 13 |
| Undernourished | 16 | 12 | 4 |
| Correct weight | 31 | 22 | 9 |
| Weight not stated | 12 | | |

Alcohol was found to play little if any part in causing coronary occlusion Eleven patients were excessive drinkers

In order to evaluate whether excessive habits were predisposing factors to coronary occlusion, excessive smoking was defined as smoking more than a package of cigarets a day or four to five cigars a day Thirteen patients were classified as excessive smokers, 24 were moderate smokers, 40 did not indulge in any tobacco and 31 were unclassified

In discussing alcoholism it is realized that it is difficult to determine what is excessive and what is to be considered moderate drinking, as this is influenced by cultural patterns Only 3 patients were found to consume alcohol daily Twenty-four patients stated that they imbibed occasionally, 49 patients did not use any alcohol and 32 patients did not state their drinking habits Therefore our findings concur with those already mentioned

### OCCUPATION OF PATIENTS

Hedley[8] analyzed 5,116 deaths due to coronary occlusion on the basis of the patient's occupation, and he calculated "the occupational mortality per hundred thousand as 154 for professional men, 144 for proprietors managers and officials, 128 for clerks and salesmen and 107 for workers (all classes) at ages 36 to 64"

Master, Dack and Jaffe[9] studied 1,700 proved cases of coronary thrombosis and drew the following conclusions 35 05 per cent of their patients were manual workers, 10 05 per cent housewives, 11 per cent business men, 10 per cent retired, 9 5 per cent white collar workers, 9 per cent professional people and 5 5 per cent store workers

TABLE 3—*Classification of Occupation*

| Occupation | No of Cases | Per Cent |
|---|---|---|
| Business men | 21 | 19.44 |
| Retired | 16 | 14.81 |
| Professional | 9 | 8.33 |
| Laborer | 30 | 27.7 |
| Housewives | 28 | 25.9 |
| Not classified | 4 | 3.7 |

Smith, Sauls and Ballew,[3] reviewing a hundred cases of coronary occlusion, noted that 67 per cent of the patients were business men of executive type or those engaged in small businesses which demanded excessive individual effort The frequent occurrence among traveling men was also noted They suggested that those who work hard and have irregular living habits are more vulnerable to this disease Ten per cent of the group were physicians

### HYPERTENSION

Hypertension antedating coronary occlusion has been reported in 33 to 73 per cent of the patients diagnosed as having myocardial infarction Of 100 studied by Smith, Sauls and Ballew,[3] 41 were observed to have preceding hypertension Hypertension persisted in 18 of the patients and normal or low blood pressure was found in 78 per cent after the attack The blood pressure reduction persisted from months to years following the coronary accident There was no relationship between the mortality rate and the previously existing hypertension It has been shown that the incidence of hypertension in women with coronary occlusion is 32 per cent higher than that found in men[9]

Of the women in our series 65 51 per cent had hypertension, while 39 23 per cent of the men had hypertension We wish to stress the fact that in women with coronary occlusion the patient is more frequently elderly (over 60) with hypertension and/or diabetes mellitus

9 Master A M Dack Simon and Jaffe H L cited by Smith Sauls and Ballew[3]

Hypertension per se, is not the only etiologic factor in the production of coronary heart disease This has been suggested by clinical and postmortem examinations, which point to the fact that, although the Negroes have more hypertension than white patients, they show a significantly lower incidence of coronary artery disease Therefore it has been postulated that if hypertension by itself were the major determining factor in producing coronary arteriosclerosis there would be proportionately more coronary disease among the Negroes than in the white population [4]

### TYPE OF INFARCTION

The relationship of anterior infarction to posterior infarction is 64 to 33, or a ratio of 1 93 to 1 Electrocardiograms were not obtained on 12 patients who died suddenly, however, diagnoses were confirmed by either autopsy and/or clinical interpretation

### LABORATORY FINDINGS

Rabinovitz, Shookhoff and Douglas [10] reported that an increased sedimentation rate accompanied coronary occlusion It was noted that the increase appeared later than the leukocytosis and fever, and that it persisted longer These observations were verified by Burak [10] In 1935 Bickel, Mazer and Sciclonoff [10] found a high sedimentation rate in coronary occlusion and felt that

TABLE 4—*Authors Findings on Hypertension*

| | Total | Men | Women |
|---|---|---|---|
| Total number of persons with hypertension | 50 | 31 | 19 |
| | | Mm Hg | |
| Average systolic pressure in all patients | 190 1 | | |
| Average systolic pressure for each sex | | 187.2 | 194 5 |
| Average diastolic pressure in all patients | 122 3 | | |
| Average diastolic pressure for each sex | | 109 7 | 106 6 |

this condition was caused by absorption of necrotic tissue Hoffmann [11] recording the sedimentation rate in 16 cases, concluded that in a majority of cases the leukocyte count and the temperature rise before the sedimentation rate In the first few days of the illness the sedimentation rate is therefore not as diagnostic as the temperature and the leukocyte count The sedimentation rate gradually returns to normal as healing of the infarction takes place, but it is not invariably true Elevation of the rate was found in every case studied It is important to remember that the sedimentation rate decreased with the onset of myocardial failure

Richter [1] reviewing 56 cases of coronary occlusion, noted that in 42 (75 per cent) a leukocytosis existed, usually between 12 000 and 18,000 With a few exceptions leukocytosis appeared on the second and third days following the onset of the clinical symptoms An elevated white blood cell count has been observed within two hours after the onset of the attack The usual count ranged between 12,000 and 20,000 [12] A transient glycosuria has been noted during the acute phase of coronary occlusion This condition clears up after the acute stages of the clinical picture have passed off [13]

The Wintrobe technic for determining sedimentation rate was utilized in measuring the rates in our patients 12 mm per hour being normal

The normal sedimentation rate in these patients was accounted for by the fact that a number of them died before the sedimentation rate became elevated or by the fact that some of the patients were examined at times when an elevated sedimentation rate would not be expected, also many of these patients were studied

TABLE 5—*Type of Infarction as Diagnosed by Electrocardiograms*

| Old anterior infarction | 31 |
| Old posterior infarction | 13 |

before the sedimentation rate was used as a laboratory aid in diagnosing coronary occlusion The normal white blood cell count is accounted for by the first two reasons given for the normal sedimentation rate

### POSITIVE SEROLOGIC REACTION

Syphilitic involvement is seldom noted The records of necropsies at the Mayo Clinic fail to reveal the mention of such a lesion It is, however, noted that one or both coronary ostia are frequently occluded by the scarring process consequent to syphilitic aortitis, however, in these cases the coronary arteries themselves are uninvolved [14]

In our series 3 males showed a positive serologic reaction, of these, 1 had a paretic colloidal gold curve Also 2 patients were known to have been syphilitic previous to onset of the coronary occlusion and were serologically negative at the time of their occlusion One can only conjecture as to the part antisyphilitic therapy played, if any, in bringing on their illness

### PATHOLOGY REPORTS

Appelbaum and Nicolson [15] reported their findings in 168 cases with occlusive diseases of the coronary arteries observed at the autopsy table In the atherosclerotic group (150 cases) the pathologic picture was that of sclerosis of the coronary arteries The weight of the heart in most of the cases studied showed considerable increase above the average considered normal for the sex and age of the patients reported Fifty cases exhibited a pericarditis In 113 of the cases complete occlusion of one or more vessels was demon-

| Average white blood cell count | 13 98[illegible] |

strated Multiple occlusion, that is, involvement of more than one vessel or branch, was noted in 16 of the 113 cases The ratio of the occlusion of the left coronary artery to that of the right was 3 to 1

Infarction in the anterior and apical section is usually caused by occlusion of the anterior descending branch of the left coronary artery Infarctions of the posterior basal portion of the left ventricle is most

frequently caused by occlusion of the main trunk or of a branch of the right coronary artery

Aneurysm of the heart was noted in 57 of 157 cases, while 9 cases showed rupture of the heart involving the left ventricle

### SYMPTOMS AT TIME OF ONSET

The classic signs of coronary occlusion are often preceded by premonitory signs, which include slight pain or sense of tightness within the chest, which may or may not be associated with a dull pain that radiates especially to the left arm Epigastric distress of a vague type may accompany the chest complaints or it may be the only early sign of warning With the onset of the coronary occlusion there is usually an agonizing chest pain, which is either of a burning, constricting or pressure sensation Nausea and vomiting are also early symptoms Often the patient complains of a great weakness or a sense of prostration The pain noted with the onset of the illness may be referred to the left arm, neck, jaws, abdomen or right arm The face is often characterized by an ashy appearance, and the features register an almost unbearable pain The blood pressure frequently falls within a few hours after the onset of symptoms, the low pressure existing for an indefinite time Pulmonary edema is often associated with cyanosis Hemoptysis may be noted in severe congestion in the lungs Cerebral symptoms, such as mild delirium or a semicomatose condition, may be brought on by a sudden fall of pressure, associated pain, emotional disturbance and the sedative administered to the patient [16]

Painless coronary occlusion has been recognized frequently and was described soon after myocardial infarction became a clinical entity It has been observed that chronic infarction, as a result of gradual narrowing or closure of a coronary artery, is frequently detected in spite of the clinical history which does not include a bout of pain characteristic of acute coronary occlusion An occasional patient may have an acute myocardial

infarction without pain but will usually show profound shock or dyspnea [17] Dyspnea of varying degrees is sometimes the only indication that a coronary occlusion has occurred Fever is usually found two to three days after the onset of the illness and ranges between 101 and 103 F The duration depends on the size of the infarct [18]

There were 10 patients who showed no symptoms referable to the heart (asymptomatic) Sixteen instances of painless coronary occlusion were noted, 4 in women and 12 in men

### X-RAY FINDINGS OF THE HEART

Marvin,[19] quoting Master, states that the latter has described findings in fluoroscopy which he believes is typical of myocardial infarction He noticed localized abnormalities in pulsation of the ventricles, consisting of a localized decrease in movement of the ventricular wall and the lack of movement or reversal of pulsation Other roentgenologic evidence of coronary arteriosclerosis is calcification of the vessels or ventricular aneurysm [19] Calcium deposits may be occasionally demonstrated in a devitalized area of a heart muscle following coronary occlusion [20]

Palmer [21] studied 200 patients with coronary occlusion who had survived the attack by three months Cardiac enlargement was found in 128 (64 per cent) Master and Jaffe [22] reported 2 cases of pericardial effusion following coronary occlusion, both diagnoses being made by radiologic evidences Wolff and White [2] have called attention to rapid dilatation of the heart that could be noted on x-ray examination

### PHYSICAL FINDINGS OF THE HEART

Shock and collapse are measured by the fall in blood pressure and by other such signs as pallor and cold sweat Abnormalities of rhythm frequently occur after acute coronary occlusion Among these abnormalities are ventricular tachycardia and ventricular fibrillation, the latter often being the cause of sudden death Ventricular extrasystoles frequently appear after myocardial infarction If the extra beats originate from a single irritable focus, as shown by the fact that all have the same appearance on the electrocardiogram, they are probably of less importance than those which originate from different foci Auricular fibrillation is often noted two to three days after the attack It is transient in 70 per cent and permanent in 30 per cent of the cases in which it occurs It has not been determined just how serious this complication is

Paroxysmal auricular tachycardia is occasionally noted after coronary occlusion If such rhythm persists for many hours it may result in cardiac failure, pulsus alternans is occasionally found and suggests serious cardiac damage Gallop rhythm is a serious sign,

indicating myocardial damage [23] Ticktock sounds and extremely feeble cardiac tones, as well as murmurs of relative insufficiency of the valves, have been noted following coronary occlusion [10] Other physical signs of coronary occlusion are rapid or slow pulse, precordial friction rub and moist rales at the base of the lungs [16]

MODE OF THERAPY EMPLOYED

The treatment of coronary occlusion is by no means standardized, nor do all clinicians who are confronted with this problem agree on the effectiveness of the various medications used The treatment of each case of coronary occlusion must be individualized

It has been our practice to use morphine sulfate in large doses when there is extreme pain and restlessness after an infarction has taken place This is administered in ¼ grain (0 016 Gm ) doses, which is repeated in twenty to thirty minutes if there is no relief Only an occasional patient has been given ¾ grain (0 05 Gm ) of morphine to relieve the initial pain After pain has been relieved morphine is given as needed to counteract any further distress

If vomiting is profuse and is aggravated by morphine 1/16 grain (0 004) Gm ) of dihydromorphinone hydrochloride or ⅓ grain (0 02 Gm ) of pantopon is substituted Papaverine in ½ grain (0 03 Gm ) doses has been administered intravenously, as much as 2 grains (0 13 Gm ) being given in a period of a half hour in an effort to relieve coronary spasm It has been our impression that papaverine, orally as well as intravenously, has been of but little benefit in the treatment of this condition At no time has there been any remarkable relief of pain, nor has there been a tendency to diminish ventricular extrasystoles Recent work by other investigators has confirmed this opinion This drug has been discontinued in our clinic in the treatment of coronary artery disease

Recently isonipecaine has been used in an attempt to alleviate the pain of coronary occlusion, being administered in 75 to 100 mg doses, but it does not appear to be a valuable drug, as it does not relieve the severe pain of this condition Atropine has not found favor with us in an attempt to relieve the pain of coronary occlusion

Ammophylline has been employed freely in the treatment of this cardiac condition It is given orally in doses of 3 grams (0 2 Gm ) after meals At no time is it used intravenously during or immediately after an acute attack for fear of lowering the blood pressure further and creating a state of shock which originally did not exist The use of quinidine is debatable with few exceptions We have used it routinely in our cases of acute coronary thrombosis and feel that it is especially valuable in cases showing a well defined sinus tachycardia or the existence of many ventricular extrasystoles It is almost universally accepted that quinidine is the drug of choice when ventricular tachycardia is proved by electrocardiogram This is done to prevent ventricular fibrillation with resulting sudden death When quinidine is used it has been given in very small doses initially to detect any sensitivity (cinchonism), if this is absent, it is then given in the dosage of 12 to 30 grains (0 8 to 2 Gm ) daily

TABLE 9.—*X-Ray Findings of Reviewed Cases*

We have been frequently called on to treat cases of acute coronary occlusion that have broken compensation Digitalis has been the drug of choice in spite of the dangers associated with more forceful action of the heart Venipuncture and the withdrawal of 250 to 500 cc of blood is a useful adjunct in relieving the load of the heart, and it is especially useful in the treatment of acute pulmonary edema associated with acute myocardial infarction Mercupurin has been valuable in helping to mobilize the excess tissue fluids associated with decompensation Whenever possible the patient is given ammonium chloride, which augments greatly the action of the mercurial diuretic One big disadvantage in the use of mercupurin is the interference by frequent urination with the patient's rest, which is so vital early in the disease In many cases 50 cc of 50 per cent glucose solution, given twice a day, has furnished a source of myocardial energy and at the same time has proved valuable as a diuretic when copious diuresis is undesirable

For sedation, phenobarbital has been the drug of choice If the patient is vomiting during the acute attack, it is given intramuscularly in 2 grain (0 13 Gm ) doses as needed When possible, the drug is given orally in ½ grain (0 03 Gm ) doses three to four times a day Sodium bromide has been used in place of phenobarbital on occasions in the dosage of 7½ grains (0 5 Gm ) three to four times a day

When the symptoms of circulatory collapse prevail, an oxygen tent is immediately ordered and continued as long as one to two days after this phenomenon has disappeared Nikethamide and caffeine with sodium benzoate are used in order to alleviate the shocklike picture Insulin is, of course, used when indicated in diabetes mellitus

Follow-up therapy has often necessitated the use of glyceryl trinitrate for angina pectoris We do not use this drug during an acute myocardial infarction because of the tendency to lower the blood pressure, with its disastrous results After the dismissal of the patient from the hospital we usually deem it safe to treat any complicating condition, such as hypertension, generalized arteriosclerosis or the menopause However, it is unwise to give vigorous antisyphilitic therapy for fear of causing occlusion of a coronary artery at its orifice This is especially true for arsenical medications

23 King H C Prognosis in Coronary Heart Disease and After Coronary Occlusion Ohio State M J 33: 524-527 (May) 1937

LeRoy and Snider[24] feel that intravenous atropine sulfate combats the generalized coronary vasoconstriction subsequent to myocardial infarction. Papaverine has been given intravenously in doses of ½ to 1 grain (0.032 to 0.065 Gm.). When this drug does not relieve the pain, morphine is given in doses of ⅙ to ¼ grain (0.01 to 0.016 Gm.).[25] Borg[24] has advised the use of quinidine in an attempt to avoid ventricular fibrillation. Myocardial failure subsequent to acute coronary occlusion has been treated with the careful use of digitalis, aminophylline and adequate oxygen (as a rule we routinely place acutely ill patients in an oxygen tent). Kilgore,[26] quoting Rizer, has called attention to the use of oxygen in the relief of pain in coronary occlusion. This has greatly reduced the need for morphine in many cases. Dextrose has been used intravenously, especially for the heart threatening failure.[26] Fowler and his associates[27] advised the use of aminophylline, since it has been shown to be effective in promoting collateral circulation. Either the intravenous or the oral route may be used, depending on the situation.

The diet which has been prescribed for our patients over the past fifteen years has been a variable one. Among those used was a cardiac diet (approximately 1,500 calories), which is a diet modified so that there is a low salt intake, with potassium chloride utilized as a salt substitute. For diabetes mellitus a diet which is adequate from a nutritional standpoint is used and is covered with insulin as needed. Occasionally patients have been put on a modified Sippy regimen when it was felt that it was necessary to treat a complicating peptic ulcer and to maintain nutrition and at the same time avoid reactivation of the upper gastrointestinal lesion. Intravenous fluids in the form of 50 cc. of 50 per cent glucose was used, being given very slowly twice a day (forenoon and afternoon). It is felt that this is a ready source of energy, especially for the myocardium. On occasion, patients have been given a general diet (approximately 1,500 to 1,800 calories a day). The diet most commonly used has been the soft diet, which most patients feel is adequate food at bed rest. This diet is a transition between the liquid and full diets. It contains all the liquid and solid foods low in residue, finely divided and well cooked. Total calories permitted are 1,500 to 1,800 calories a day.

At the present time we feel that the diet must be individualized for each patient. A patient who enters in shock or who has nausea and vomiting is usually given only liquids in small amounts as tolerated and is permitted solid foods as desired. Patients who are able to take solid foods at the time of entrance into the hospital are usually given a soft diet, with fluids as desired. Those who enter decompensated are put on a cardiac diet and permitted 1,500 cc. of fluid a day.

Formerly the patients treated in our clinic were put at complete bed rest for six to eight weeks. They were not permitted to bathe themselves and were fed by the nurses. At the present time our older patients (55 years or more) are treated by being put at absolute bed rest for a period of three weeks and our younger patients for six weeks. The patients are not permitted to bathe themselves and are fed for a period of two weeks. After this time they are permitted slight activity while in bed, namely, bathing and feeding themselves. At the end of three weeks the older patient is permitted to sit up in a chair for one-half hour the first day, with increases of fifteen to thirty minutes each following day. The younger patient is permitted out of bed at the end of the sixth week and put through the same routine. It is felt that prolonged bed rest slows the circulation in the older patient, thereby predisposing him to further attacks of myocardial infarction. Decreasing the period of bed rest also tends to lessen the incidence of pneumonia and the trouble some complication of painful joints and/or ankylosis of the joints.

The average length of stay in the hospital for the older patient is four weeks, and for the younger patient seven weeks. Follow-up treatments at home consist in permitting the patient to have bathroom privileges and gradually to increase his activities. Barring complications, the patient is permitted to make his weekly visits to the outpatient department ten days after leaving the hospital.

### COMPLICATING DISEASES

It has been found that there are many conditions which serve as complicating factors in coronary occlusion. Several of these conditions are often found in the same patient.

In a series of 100 cases reported by Smith, Sauls and Ballew,[3] diabetes mellitus occurred 8 times. Chronic cholecystitis was found 9 times among their patients. Four patients had oral sepsis, 9 had chronic bronchitis. Master, Dack and Jaffe[9] found 11.2 per cent of diabetes in a review of 500 patients, who were mostly Jewish.

Clinically, it would seem that the most important complicating factors appear to be those of hypertension, obesity, diabetes mellitus, generalized arteriosclerosis, polycythemia vera, chronic cholecystitis and cholelithiasis and underlying infection.

### ANGINA PECTORIS

The syndrome of angina pectoris is a manifestation of coronary arteriosclerosis. Barnes and Pruitt[17] feel that the diagnosis of angina pectoris is difficult to make for two reasons: first, the inability to recognize the

27. Cited by Middleton.[29]

syndrome and, secondly, the labeling of thoracic pain as angina pectoris when actually it is the manifestation of some other condition Three characteristics which constitute the diagnostic triad are distress located behind the sternum attacks of angina pectoris being precipitated by activity that increases cardiac work, especially physical exertion, walking or ingestion of food, and, thirdly, the attack of angina pectoris being very brief Usually the seizure is over in a few minutes, seldom lasting more than thirty minutes

Smith, Sauls and Ballew [3] studying 100 patients with coronary occlusion noted that 33 had angina pectoris before and after their attack Twenty-three patients complained of angina pectoris after myocardial infarction Thirteen patients noted that their anginal attacks disappeared after the occlusion Ten patients who gave a history of previous angina pectoris died in their immediate attack of coronary occlusion Twenty-one patients did not have angina before or after their coronary occlusion or gave histories which were too indefinite to use as a basis for conclusions

Forty-five patients (41 66 per cent) studied in our series gave a preceding history of angina pectoris Of this total 10 (9 25 per cent) were female patients and 35 (32 40 per cent) were males The ratio of males to females was 3 5 to 1 This high incidence of preceding angina pectoris indicates that from 30 to 40 per cent of all patients with this affliction will eventually have an attack of coronary occlusion

### MECHANISM OF DEATH

Appelbaum and Nicolson [15] reported rupture of the heart in 9 of 150 cases of coronary occlusion Rupture occurred through the left ventricle in all cases Cardiac rupture usually occurs in the acute stage of softening, but it may occur after the necrotic area has been replaced by scar tissue Two cases of ruptured cardiac aneurysm were reported

Falk,[25] discussing the causes of sudden death after coronary occlusion, states that ventricular fibrillation has been reported by several observers who took electrocardiograms just before death The occurrence of frequent ventricular extrasystoles is felt to be an ominous sign, since the more frequently they occur, the greater likelihood there is of sudden death Massive pulmonary embolism is another immediate cause of death which occurs following coronary occlusion The emboli do not come from the heart but usually from the iliac veins Thrombosis of the iliac veins is favored by the lowered blood pressure and the prolonged bed rest Myocardial failure, with pulmonary edema, has been noted during recovery from coronary occlusion Death is not an infrequent result of this complication

### TYPE OF DECOMPENSATION AFTER AN ATTACK OF CORONARY OCCLUSION

In our series 10 patients were noted to have acute decompensation coming almost immediately after the onset of the illness Forty-one of the patients developed a chronic form of decompensation, that is, recovered from their attack of occlusion and then went on to cardiac decompensation The latter form of decompensation usually takes place because of poor myocardial nutrition associated with coronary sclerosis The remainder of the patients did not show any decompensation from the time of the onset of their illness until death, and no statement was noted on the records with regard to this factor for 7 patients

### POSTOPERATIVE PATIENTS

It is always of major importance to know whether a given patient who has coronary artery disease is able to tolerate an operative procedure Three of our patients had their occlusions two weeks or less after their surgical operation In our clinic and hospital the surgical patients predominate greatly over the medical patients in number It would therefore seem that patients with coronary sclerosis definitely tolerate surgery and that surgery is a very minor point as a precipitating factor in coronary occlusion

### TIME OF ONSET

Thirty-six patients noted the onset of their illness during the day, whereas 21 patients had their attack at night The night was considered from 7 p m to 7 a m In the classic description of the onset of coronary occlusion it has always been stated that the patient is frequently aroused from his sleep between 2 a m and 4 a m, although no explanation for this has been definitely proved It has been suggested that the slower circulation noted during sleeping hours has been a predisposing factor

### DIFFERENTIAL DIAGNOSIS OF CORONARY OCCLUSION

The following conditions may be confused with coronary occlusion and therefore must be ruled out when making a differential diagnosis angina pectoris, ruptured peptic ulcer, gallbladder disease pancreatitis, pericarditis, pulmonary embolism mediastinal emphysema, neurocirculatory asthenia, metastatic lesions to the vertebrae and ribs, spinal arthritis myalgia and arthralgia in the region of the left shoulder, pain of the thoracic wall mediastinal lymphadenopathy penetrating diseases of the aorta, such as dissecting aneurysm of the aorta, rupture of the aorta and saccular aneurysms, such as in syphilis Still other conditions are pleurisy, cardiospasm, diaphragmatic hernia rib fractures or injuries intercostal neuralgia, herpes zoster scalenus anticus syndrome, pneumonia, pulmonary atelectasis, functional indigestion radicular pain and spontaneous pneumothorax

TABLE 12.—*Causes of Death of Reviewed Patients*

| | |

| Acute coronary occlusion | 38 |
| Congestive heart failure | 14 |
| Bronchial pneumonia | 6 |
| Chronic nephritis with uremia | 5 |
| Cause of death unknown | 5 |
| Cerebral hemorrhage | 2 |
| Rupture of a myocardial infarct | 2 |
| Cerebral thrombosis | 2 |
| Rupture of a cardiac aneurysm | 1 |
| Automobile accident | 1 |
| *Chronic myelogenous leukemia* | 1 |
| Carcinoma of stomach | 1 |

### MULTIPLE ATTACKS OF CORONARY OCCLUSION

Smith, Sauls and Ballew,[3] who reported a series of 100 cases, stated that recurrent attacks of coronary thrombosis occurred in 25 per cent With the exception of 3 patients the recurrent attacks came within two years after the first attack Fifteen of the 25 patients died in a subsequent attack, giving a mortality rate of 60 per cent as compared to the 34 per cent mortality rate following the initial attack Justice,[18] quoting Dr Frederick A Willius of Rochester, Minn who studied 370 cases of coronary thrombosis, noted that 80 per cent of the patients had only one attack, 17 per cent had two attacks, 2 2 per cent had three attacks and

0 05 per cent had four attacks It was also observed that the death rate increased progressively with the recurrent attacks of coronary occlusion The death rate for patients with solitary coronary occlusion was 47 5 per cent, while it was 70 per cent for patients having two attacks and 75 per cent for those suffering the third attack

TABLE 13—*Duration of Life After Attack of Acute Coronary Thrombosis*

| | |
|---|---|
| 29 patients died within 1 month s | time after onset of coronary occlusion |
| 7 patients died within 3 months | time after onset of coronary occlusion |
| 16 patients died within 1 year s | time after onset of coronary occlusion |
| 13 patients died within 2 years' | time after onset of coronary occlusion |
| 10 patients died within 3 years | time after onset of coronary occlusion |
| 2 patients died within 5 years | time after onset of coronary occlusion |

TABLE 14—*General Statement of Health*

| | |
|---|---|
| Good | 16 patients |
| Fair | 6 patients |
| Poor | 4 patients |

In our series 16 patients (14 8 per cent) had recurrent attacks of coronary occlusion Fifteen of these patients (93 7 per cent) died as the result of subsequent coronary accidents and 1 patient is still living Of the deceased, 11 patients suffered a second attack which was fatal, and 4 patients died as a result of their third attack, therefore 41 patients (37 9 per cent) of the total number of patients died in their initial attack, 11 patients (10 1 per cent) died in their second attack and 4 patients (3 7 per cent) died in their third attack

PROGNOSTIC FACTORS IN CORONARY OCCLUSION

No generalized statement can be made as to the definite prognosis of coronary occlusion Smith, Sauls and Ballew [3] observed 66 patients who survived their initial attacks of coronary occlusion Of this group 36 patients were followed for three years or less, 17

TABLE 15—*Type of Medication Used by Surviving Patients*

(Several medicaments used by same person)

TABLE 16—*Type of Infarcts in Surviving and Deceased Patients*

| | |
|---|---|
| 14 with anterior infarcts survived | |
| 50 with anterior infarcts (78 12%) died | |
| 12 with posterior infarcts survived | |
| 21 with posterior infarcts (63 63%) died | |

patients were studied for three to six years and the final group of 12 patients were studied from six to nine years One of these patients was followed for a period of twenty-three years and was still alive at the time of the writing of the paper The life span of 34 patients following the initial attack of coronary occlusion showed that 13 patients died in less than twenty-one days, 10 died within ten months, 10 survived for twenty-eight months and 1 patient lived six years and two months

King [23] reviewing 62 cases of acute coronary occlusion, noted a mortality rate of 18 per cent The average age of the patients who died was 62 years, while the average age of the surviving group was 48 years Willius [14] has stated that one half of all patients with coronary occlusion die at the time of their first attack or within a few days thereafter He also claims that those surviving the first attack live a variable period from months to years after their illness In a report by Goodson and Willius [28] in which coronary occlusion among persons less than 40 years of age was observed, the authors reported that at the time of the conclusion of their study 8 persons (26 6 per cent) had died and that the average survival period from the initial attack was twenty-two months Ten (28 per cent) of the surviving patients developed a second attack of coronary occlusion within one month to six years following their initial attack Of the latter group 2 patients died the day of their second episode Middleton [20] feels that from the prognostic standpoint anastomosis plays an important part in coronary occlusion Occlusion of a coronary artery is inevitably fatal without adequate collateral blood supply It is felt that age is an important

TABLE 17—*Contrast of the Weight of the Total Reviewed Patients and of Surviving Group, Taken at Time of Onset of Illness*

| | Total Reviewed Patients | Surviving Group |
|---|---|---|
| Obese | 45.39% | 22 44% |
| Correct weight | 28 70% | 35.50% |
| Underweight | 14 81% | 25 00% |
| Unknown | 11 11% | |

TABLE 18—*Physical Findings of the Heart*

| | |
|---|---|
| Surviving group | |
| Normal heart findings | 19 (41.30%) |
| Abnormal heart findings | 14 (57 72%) |
| Total group | |
| Normal heart findings | 29 |
| Abnormal heart findings | 70 |

factor in the prognosis in any given case The general experience gives a better outlook to the younger patient with coronary occlusion It is often noted that the younger person more often resumes more of his previous activities It is felt that, with passing years, coronary sclerosis makes for collateral circulation preparing against the accident of coronary occlusion, but there is usually an underlying myocardial malnutrition and fibrosis resulting from the coronary sclerosis

STATISTICAL FINDINGS ON SURVIVING GROUP THEIR PROGNOSTIC VALUE

Of our total group of 108 reviewed patients there are 26 definitely known to be alive and it is questionable as to whether 5 are deceased or alive. Of the latter group 3 are males and 2 are females

*Time of Onset*—The interval of time from the onset of the illness to the time when the study was begun was thirty-four months, considering only the 26 patients known to be alive, whereas the average life span following illness for the deceased patients was 13 4 or 15 8

28. Goodson W H, and Willius F A. Coronary Thrombosis Among Persons Less than Forty Years of Age A Study of Thirty Cases Minnesota Med. 22 291 293 (May) 1939

months, not considering those patients who died within twenty-four hours after their initial attack

Five patients survived more than five years, of this group 1 patient lived five years and six months, 1 survived six years and one month, another survived six years and four months One patient lived seven years, and the longest life span was seven years and two months

*Sex of Patients*—There were 23 males and 3 females in the surviving group, therefore 29 11 per cent of the males survived their attacks as compared to 10 34 per cent of the females

*Age of Onset*—The average age at the time of onset of coronary occlusion of the surviving group was 54 73 years, as compared with the average age of 57 6 years for the total group The average age of onset for the deceased patients was 59 22 years

*Complaints of Shortness of Breath*—Fourteen of the patients complained of shortness of breath, while 12 did not This shortness of breath reflects the status of the coronary arteries One may conjecture as to what part cardiac decompensation might play in this

*Pain in Chest on Exertion or at Rest*—Ten patients responded yes to this question, while 16 patients said no

*Swelling of the Feet and Ankles*—Four patients stated that they continued to have swelling of the feet and ankles

*Inability to Sleep Flat in Bed at Night*—Three patients declared that they were unable to sleep flat in bed at night

*Fast Beating of the Heart*—Six patients stated that they had fast beating of the heart

The overall ratio of the total group of anterior to posterior infarcts was 1 93 to 1, whereas the death rate of the anterior to posterior infarcts was 1 06, showing a smaller death ratio, therefore, from the prognostic point of view, the type of infarct is not a very important factor

*Hypertension*—Fourteen patients in the follow-up group had hypertension previous to their attack, whereas 12 patients did not Thirty-six (72 per cent) of the patients with preceding hypertension died and 46 (79 13 per cent) not having preceding hypertension died Consequently, our findings concur with those previously stated, namely that high blood pressure is not a factor in prognosis

*Weight of the Patients at Time of Onset*—In reviewing the weight of the patients in the follow-up group, it was found that 11 patients were classified as obese, 11 as of correct weight and 4 underweight Therefore 60 5 per cent of the surviving patients were either at their correct weight or underweight This is a ratio of 2 61 to 1 when compared with the surviving obese patients Consequently we must conclude that weight is a definite prognostic factor, obesity giving a poorer prognosis

*Multiple Attacks*—Only 1 patient of the follow-up group survived more than one attack of coronary occlusion Therefore it is strongly indicated that multiplicity of attacks is a poor prognostic factor

*Preceding Angina Pectoris*—Forty-eight (44 44 per cent) of the total group had preceding angina pectoris, 12 patients in the surviving group had preceding angina pectoris, therefore 36 patients (75 per cent) of the patients having preceding angina pectoris died This seems to indicate that angina pectoris previous to the onset of coronary occlusion is a poor prognostic factor

*X-Ray Examination of the Heart*—There were 61 cases of the total group who exhibited abnormal findings on x-ray of the heart Of this group only 14 survived There were 25 patients who showed normal size hearts on x-ray and of this group 10 survived The ratio of abnormal x-ray findings as to normal findings was 2 44 to 1, whereas the death ratio was 3 13 to 1 Therefore we may conclude that a normal size heart on x-ray examination is a favorable finding

*Type of Decompensation*—In the surviving group 1 patient showed acute decompensation, 4 patients developed chronic decompensation, 20 patients showed no decompensation and for 1 patient it was not stated Therefore only 1 per cent of the patients with acute decompensation survived, 9 7 per cent of the patients with chronic decompensation survived, and 40 per cent of the patients with no decompensation survived Consequently we find that the lack of decompensation is a favorable prognostic factor

The ratio of those having pathologic change in the total group to those not having pathologic change was 2 72 to 1 The death ratio of patients having abnormal heart findings was 3 81 to 1 Therefore we may conclude that patients having normal heart findings have a better outlook for the future

## SUMMARY AND CONCLUSIONS

1 A study of 108 patients with coronary thrombosis was made from the point of view of symptoms, signs, therapy, complicating conditions, pathology and prognosis Tables were compiled illustrating graphically most of these factors

2 Of the group, 26 were definitely known to be alive at the time of this study and were asked to fill out a questionnaire with regard to their present health

3 The general statement of health, as judged by the patients themselves, was good in 16 cases, fair in 6 cases and poor in 4 cases

4 Factors causing the prognosis to be poor were age of onset (the older patient has less chance of recovery), obesity, multiple attacks and preceding angina pectoris

5 Conditions giving a better prognosis were normal size heart on x-ray examination, failure of the patient to develop decompensation, normal heart on physical examination and early rising in elderly patients

6 Factors not altering the prognosis were hypertension and location of the infarct

**Fitness for the Enterprise**—Although there are noteworthy examples of eminent scientific achievement by men who were of frail physique—Darwin for example—it is easy to see that vigorous health is a great advantage in research as in other activities Perhaps it is especially valuable for the investigator, because he is subject to conditions which may make extreme demands on his physical strength and his resistance to disease. If he is studying infections for example, he runs the risk of being infected himself, as Zinsser was and even if he is in good health he may succumb as did Ricketts and Noguchi When the trail is hot and new results of high significance are being frequently disclosed the investigator may work himself to exhaustion He spends not only laborious days but also laborious nights and has but scant time for meals One of my students frequently followed an experiment all day and onward to its conclusion at 3 or 4 o'clock in the morning Only a stalwart man can for long endure such stresses—Cannon Walter B The Way of an Investigator, New York, W W Norton & Co Inc, 1945

## Special Article

### AMERICAN HEALTH RESORTS

# HEALTH RESORT THERAPY IN GASTRO-INTESTINAL DISORDERS

SAMUEL WEISS, M.D.
New York

*These special articles on spa therapy and American health resorts were prepared under the direction of the Committee on American Health Resorts. The opinions expressed are those of the authors and do not necessarily reflect the opinion of the committee. These articles may be published later as a Handbook on Health Resorts.*

Much of the popularity of mineral spring resorts is attributable to the high incidence of digestive ailments. Gastrointestinal sufferers are as a rule peculiarly susceptible to suggestion, so that their faith in the healing powers of mineral waters has often reached the point of fanaticism and cultism. At times this has been fostered by commercialization and even quackery, with extravagant claims for the efficacy of "cures" and disregard of their limitations. It is therefore regrettable that failures and disappointments have resulted in neglect of the really valuable services which properly applied spa therapy renders in the management of digestive disorders.

It is also essential to correct the general misconception that in some way American mineral springs are inferior in therapeutic properties to foreign ones. As Fitch [1] has remarked, "millions of patients have spent small fortunes in hunting health at European spas, when they could have had the same scientific care and considerate attention at home, and the additional advantage that our American waters are not only equal to any in the world but that many of them stand in a class by themselves."

The diversity and strength of American mineral springs is evidenced by Crook's table.[2]

Sigerist [3] recently pointed out that we have in the United States 2,717 areas with 8,826 known mineral springs, so that our spa reserves have scarcely been touched.

According to Rodari,[4] these medicinal springs may be classified as follows:

1. Alkaline carbonated waters. Their chief constituents are sodium bicarbonate and carbonic acid. In large doses they slightly stimulate peristalsis and have some mucosolvent action. They are chiefly useful in cases of hyperchlorhydria.

2. Alkaline muriated waters. In addition to sodium bicarbonate and carbonic acid, these contain sodium chloride. They stimulate peristalsis, especially when taken cold, and are used in mild cases of chronic constipation.

3. Glauber's salt waters. These contain principally sodium sulfate, with minor amounts of sodium bicarbonate, carbonic acid and sodium chloride. Their effect on peristaltic action is vigorous.

4. Sodium chloride waters. These also promote peristalsis, but their chief effect is to increase hydrochloric acid production in the stomach.

5. Bitter waters. Their high contents of sodium sulfate and magnesium sulfate render them strongly purgative.

Briefly summarized, the pharmacologic effects of mineral waters are antacid and buffering, mucosolvent, hydragogue, cholagogue, diuretic and remineralizing. McClellan [5] declares that, apart from the well known properties of the mineral constituents, the action of the Saratoga waters is due to the carbonic acid gas, which stimulates the mucous membranes of the upper gastrointestinal tract, inducing better circulation and a consequently improved secretion of gastric ferments. The carbon dioxide is expelled by belching or is eliminated through the lungs, while the salts increase the alkali reserve and render the urine alkaline. His experiments showed that, within two or three hours after ingestion of 1,000 cc. of the naturally carbonated, saline-alkaline mineral waters of the spa, the $p_H$ of the urine will reach 8.0. The stronger waters are hypertonic when compared with blood serum and draw fluids from the intestinal tract.[6]

The effect of saline mineral waters in stimulating the flow of bile may be observed in bile drainage during duodenal intubation.

Admittedly, experimental research in this field is thus far wholly inadequate to enable a satisfactory presentation of acceptable data, and it is to be hoped that spa laboratories will undertake thorough studies of pharmacologic actions both on animals and on human beings, so as to provide a more scientific and less empiric basis for spa therapy.

Whether natural mineral waters possess properties which are not exhibited by artificial mineral waters of apparently the same composition, so that some constituents of the former have escaped analysis, is not definitely established. If the reports of patients who have used both kinds are credible, there is some unaccountable difference but this may be purely psychic.

The etiology of gastrointestinal diseases largely explains the results from spa therapy. Generally speaking, and excluding particularly specific infections and neoplasms, most digestive disorders are neurogenic in origin and develop in chronicity to the accompaniment of a progressive neurosis. Improvement in digestion is concurrent with improvement in the nervous condition, and vice versa. Temporary relief follows pleasurable diversions just as exacerbations follow mental depression. "Nervous indigestion" may be regarded as the expression of a vagotonia induced by prolonged emotional strain, anxiety, overwork, lack of exercise and of rest, and above all by dietary abuses, including in some case overindulgence in alcohol and tobacco, and possibly sexual excesses.

Correction of these factors at home is difficult and often impossible. In his customary environment the patient frequently cannot be controlled sufficiently to insure implicit obedience to the necessary dietetic and hygienic regimen, and his tendency is toward infraction of the rules when there has been a little improvement, thus incurring setback after setback. A further handicap may be the presence of well meaning but interfering relatives and friends who pamper hypochondriacs or who irritate the patient with petty disagreements or worries when peace and quiet are most needed. In the case of men, the wear and tear of business or profes-

6. What role trace elements in the mineral waters may play was the subject of a special article in the symposium on health resorts.

sional activities is a constant drain for which medical management can hardly compensate

Sojourn at a distant health resort at once eliminates these complications The patients are put into an atmosphere most conducive to a healthful regulatory routine, so that the spa treatment can yield the maximum therapeutic benefit In consequence they return home with definite improvement in their objective and subjective symptoms It is impossible to evaluate separately just what portion of the benefit must be credited to drinking the waters plus the auxiliary baths, packs, massage and other forms of physical therapy, and what portion of the gain is contributed by freedom from the neurogenic factors which played a causal role

In general the indications for spa therapy in disorders of the digestive system may be classed as (1) gastric neuroses ("nervous dyspepsia"), (2) subacute and chronic gastritis, (3) intestinal atony, (4) chronic colitis, (5) gallbladder disease—dyskinesia, chronic cholecystitis, gallstones, (6) chronic hepatitis—congestion, enlargement, catarrhal jaundice—and (7) postoperative recurrence of digestive disturbances

Spa therapy is most useful in the treatment of gastric neuroses in which there is no demonstrable pathologic change in the stomach or other organs and in which the symptoms are anorexia, eructations, pyrosis and nausea, with epigastric pressure which disappears when the stomach is empty

Digestive disorders limited exclusively to the stomach are, however, comparatively infrequent Gastric dysfunction is usually soon followed by disturbed chemistry in the intestinal tract, and in long-standing cases hepatovesicular involvement is commonly encountered The patients present a syndrome which includes in variable number and degree slight jaundice, bilious vomiting, heaviness in the right upper quadrant and intolerance to eggs, fats and chocolate They may awaken during the night with pressure or pain in the epigastrium, right hypochondrium or lower part of the abdomen This may lead to an erroneous diagnosis of ulcer or chronic appendicitis, or the generalized abdominal discomfort may be ascribed to a colitis especially if the patient complains of postprandial diarrhea or several small unsatisfactory evacuations The real cause, however, may be found in a cholelithiasis cholecystitis or hepatitis following dietary excesses, malaria or amebiasis, or there may be a hepatic insufficiency due to familial cholemia with intestinal infection or intoxication The digestive disturbances may also be traceable to a biliary dyskinesia due to hypermotility or hypertonicity of the gallbladder or to atonic distention of the gallbladder caused by a spasm of Oddi's sphincter Occasionally a food allergy may be the primary exciting cause

When the condition has been correctly diagnosed, spa therapy may have a place in its treatment The waters may aid in relieving the gastric disturbances

*Comparative Potency of Representative American and European Springs**

* These represent the latest available analyses of American and European springs In some cases no recent analyses are available

and decongesting the viscera, thus acting on both cause and effect In about one half of the cases there is considerable improvement

In many cases of cholelithiasis which do not require surgical intervention spa therapy lengthens the intervals between biliary colics and occasionally even prevents recurrences Jaundice, choluria and bilinuria frequently clear up, the tenderness elicited in examining for Murphy's sign disappears, and the enlarged liver retrogresses in size

In intestinal atony the cases must be carefully selected and the use of mineral waters individualized, as the response in different subjects varies The sodium chloride waters are indicated when there is deficient gastric secretion, while sodium sulfate waters are preferable in cases of constipation with hyperacidity, duodenitis and colitis The immediate aim is to clear the intestinal tract of mucus and feces as gently as possible It is often astonishing to observe the enormous quantities of putrid, decomposed fecal residues which are passed, even by patients who have taken cathartics daily After the waters have served their purpose, it is of course advisable to correct the constipation by regulating diet, the intake of fluids and exercise rather than by reliance on laxatives Abdominal calisthenics, if conscientiously employed, are extremely helpful, as is light massage in cases in which there is no ulceration, colitis, chronic appendicitis or cholecystitis

The condition of the heart, kidneys and other organs must be taken into account when prescribing mineral waters Definite contraindications are formed by acute infectious processes, neoplasms or intestinal obstructions not caused by fecal impaction Mineral waters may also be harmful in cases of gastric succorrhea by increasing dilatation of the stomach though here the cautious administration of mineral water in very small and divided doses may be beneficial

According to Humphrey [7] the routine Saratoga spa treatment is as follows

The complete history is taken and the patient carefully examined to determine the most eligible procedure in each case The mineral water (Hathorn water No 2 or 3 or any other water of similar constitution) is taken three times daily before meals, preferably at the spring The patient sips 1 pint or more one-half hour before breakfast, allowing at least five minutes per glass and walking about while taking it, and this is followed by a twenty minute walk The same routine is carried out before the midday and evening meals, but at these periods Coesa or Geyser water is preferable as a stimulant of bile flow to prevent precipitation Should the patient have a biliary attack, a pint of Coesa or Geyser water is given every four hours, or a glass every two hours In order to prevent renal overactivity not more than this quantity should be taken per day

Twenty-one to thirty baths in the natural mineral waters of the spa, extending over a period of four to six weeks, depending on the frequency and severity of biliary attacks, constitute a course of treatment After one to three baths there is a day of intermission, not more than five baths each week are given The number of baths is adjusted to the patient's strength The temperature of the water must not exceed 97 or 98 F or fall below 92 F unless there is a special reason The bath is not to be taken within one hour after eating Its duration is fifteen to twenty-five minutes in accordance with the patient's condition, and it is immediately followed by resting half an hour Patients with valvular disease or myocardial degeneration may take these baths with a reduced amount of carbon dioxide gas, their response being carefully watched

Exercise is permitted when the patient has been free from biliary attacks for four weeks or longer Routine calisthenics consist of extension and rotation of the arms, without bending the body Moderate walking is encouraged

Colonic irrigations may be given to stimulate circulation in the hepatic area once a week on a rest day from bathing After the procedure the patient should rest for an hour

Massage is carefully applied for short periods daily, avoiding the gallbladder area

This course of treatment is repeated for two or more years

Unfortunately, many patients resume their former habits when they return home In such cases there is never complete recovery, and spa therapy repeated year after year is only of temporary benefit and finally of no avail

Indiscriminate use of the waters by the public may be exceedingly injurious The patient should be allowed to take them only under competent medical supervision Personal observation underlines the danger of self prescribing Thus a patient who took the waters haphazardly on the recommendation of friends at one of the well known health resorts developed an acute cholecystitis and empyema, necessitating an emergency operation Another one, who drank large amounts for his constipation, induced a severe attack of diarrhea with mucus and blood in the stools, his condition became so serious from loss of blood that a transfusion had to be administered

Finally, there must be complete team work between the physician at home and the medical department of the spa Information as to the clinical history, diagnosis, laboratory findings and previous treatment should be supplied to the spa physician, and during the patient's sojourn he should be subjected to periodic examinations so that the progress may be noted and any untoward development promptly checked A final report should be rendered to the referring physician to guide in the subsequent medical care required by the patient

Spa therapy must be considered as an adjunct to and not a substitute for, individualized management of digestive disorders It is not indicated in every case, and it cannot replace the medication and other remedial procedures adapted to the needs of each patient A month at a spa, no matter how beneficial, is no safeguard against the return of ailments which are due to somatic changes and for which uncorrected habits of life may be responsible These facts should be made clear to every patient, so that he may know that his future cooperation is indispensable to the maintenance of health

American health resorts, properly equipped and efficiently managed, with competent medical supervision of spa therapy, have an important place in the management of digestive disorders American spas should stand in the same high repute and enjoy the same wide popularity which continental spas have attained

## ACUTE BACTERIAL ENDARTERITIS

DAVID M FLETT M D and W N POWELL, M D
Temple Texas

Patent ductus arteriosus is the most common lesion of the noncyanotic congenital heart disease group It is present alone or combined with other lesions in nearly 25 per cent of cases of congenital heart disease Usually the diagnosis is rather easily made by physical examination The murmur, present in the great majority of cases, is usually heard over the entire precordium but is most definite in the second and third left interspaces It is a continuous murmur, being present in both systole and diastole but with well defined accentuation during systole. It has been described as having a "humming top" or "machinery-like" character The pulmonic second sound is accentuated because of the increased pressure within the pulmonary circuit [1] Many patients carry this lesion throughout their lives with few or no physical symptoms However, according to Shapiro and Keys [2] their life expectancy is definitely shortened and eventually 80 per cent of them succumb to the disease Recently it has been noted that these patients suffer from an undetected asthenia, a fact forcibly brought out by their improvement following successful ligation of their patent ductus [3]

One of the most common and serious complications of a patent ductus arteriosus is the development of a bacterial endarteritis In Abbott's [4] series of 92 cases, approximately one fourth presented this complication In the postmortem series reported by Gelfman and Levine [5] 28.6 per cent of the cases showing a patent ductus were found to have a bacterial endarteritis Keys and Shapiro [2] state that 40 per cent of the patients in their series dying of this lesion had bacterial involvement.

The bacteriology of bacterial endocarditis is well covered in the literature, but considerably less information is available regarding the type of organisms found in the endarteritis complicating patent ductus arteriosus In the great majority of instances a streptococcus of the alpha or viridans type is responsible, but cases due to Staphylococcus aureus, Hemophilus influenzae and other organisms have been recorded A search of the literature thus far has not yielded a case of endarteritis of the ductus due to Diplococcus pneumoniae. Because of this fact the case reported here, due to Diplococcus pneumoniae type I, which was successfully treated with penicillin followed by surgical ligation, is thought worth reporting

Miss N J a white girl aged 10 years thin, pale and acutely ill, was admitted March 14, 1945 because of illness which had started about three weeks before with a severe headache, fever and pain in the left ear She was seen by her local physician at that time and a left myringotomy was performed and some form of sulfonamide drug was administered She made rather rapid recovery, the drainage from the ear ceasing within the week It was thought that she had made a complete recovery until about one week before admission here when it was noted that she continued to have some fever and then went on to develop pains in the legs and later in the knees and shoulders She also complained of headache and pains in the abdomen During the twenty-four hours before admission she had chills and some emesis

In the past and family histories the only item of importance was the information that since the age of 8 months she had been known to have some type of congenital heart disease. The parents had been informed that there was no treatment for it

On physical examination the weight was 62 pounds (28 Kg), the temperature 102.2 F, the pulse rate 140 beats per minute and the respiratory rate 28 per minute The blood pressure was 104 mm of mercury systolic and 44 diastolic. The skin was pale, hot and dry, no petechiae were noted The eyes reacted to light and in accommodation, no petechiae were noted in the conjunctivas The ear drums were normal The teeth were in poor condition and the tongue was coated The tonsils had been removed The heart was enlarged to the left, and a very loud, rough, "machinery-like" murmur was heard over the entire precordium but was most clearly defined in the pulmonic and mitral areas It was carried into the neck and left axilla and could be heard posteriorly below the inferior angle of the left scapula There was a distinct 'thrill," palpable in the second and third interspaces on the left about 2 cm from the sternal margin The abdomen was not distended, but the liver was felt 3 cm. below the costal margin and was very tender The spleen was palpable to the level of the umbilicus and extremely tender No joints were swollen or reddened, but the right knee was very painful on motion

She was admitted to the hospital with the diagnosis of acute bacterial endarteritis and congenital heart disease, probably patent ductus arteriosus

The admission laboratory examinations showed hemoglobin 10 Gm red blood cells 3,520,000, white blood cells 15,200, neutrophils 81 per cent, lymphocytes 18 per cent, monocytes 1 per cent Stained blood smears showed a normocytic, normochromic anemia with considerable left shift of the neutrophils The sedimentation rate was 76 mm in one hour (Westergren) The urinalysis was essentially normal, and x-rays of the chest and of the genitourinary area were reported as negative A blood culture on admission disclosed within eighteen hours Diplococcus pneumoniae type I, with 1,200 colonies per cubic centimeter of blood As soon as this report was obtained penicillin, 20,000 units intramuscularly every three hours was ordered On March 17 this was increased to 25,000 units every three hours A blood culture taken on the 17th showed Staphylococcus aureus thought to be a contamination Another blood culture taken on the 21st showed no growth in thirteen days A short trial of Dicumarol (3 3'-methylene-bis [4-hydroxycoumarin]) was given but it was discontinued after ten days of rather uncertain results On March 20 the hemoglobin was 9 5 Gm, with white blood cells 11,900 Transfusions of citrated whole blood were given on the 23d and again on the 27th in amounts of 250 cc each

On April 1 the patient had a slight chill and increase of temperature and pulse rate, with pain in the left chest on deep breathing Increased breath sounds were noted in the left side, but no rales or friction rub could be heard On April 2 a chest film showed some infiltration in the left midlung field at the level of the fourth and fifth anterior interspaces and some increase in markings from the right hilus as compared with a film of March 15 This had the appearance of an inflammatory process There was no evidence of effusion On a check film in twenty-four hours the process was reported to be more advanced and definitely inflammatory in appearance On April 2 the white blood cells numbered 25,050 with neutrophils 76 per cent, lymphocytes 19 per cent and monocytes 5 per cent. On April 3 the white blood cells numbered 31,400 The count then gradually receded, the last count being red blood cells 4,390,000 and white blood cells 15,550

With the advent of this complication the penicillin was again increased to 25 000 units every three hours The temperature and pulse rapidly approached normal, although x-ray films on April 9 and 12 continued to show infiltration in the left midlung field Penicillin was discontinued on the 13th after 3,875,000 units had been given over a period of twenty-eight days

The patient was dismissed on April 14 after arrangements had been made for operation for ligation of the patent ductus arteriosus to be performed elsewhere

On May 29 she underwent operation and we quote from the report [6] 'We performed transpleural multiple ligations

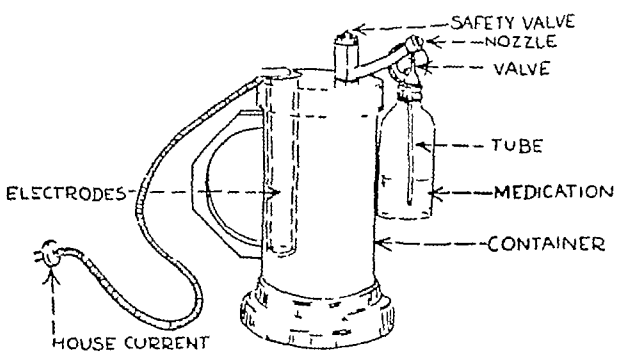
through a posterolateral incision. There was an enormous amount of inflammatory reaction around the aorta and pulmonary artery, with marked enlargement of the lymph nodes. The vagus nerve was isolated and retracted to the outer side and the ductus was located. There was a large communication, more of a fistula, between the pulmonary artery and the aorta. The tissues were very inflammatory and fixed about this opening. The inflammatory tissue was carefully dissected free and the ductus was ligated with three strands of silk. Immediately on ligation of the ductus, the thrill stopped. During her postoperative course she developed an atelectasis which required bronchoscopic treatment for relief."

The patient was seen here again for observation about Sept. 25, 1945, six months after her original admission. At that time she had gained about 25 pounds (11.3 Kg.) in weight and at least 2 inches in height. Her voice was slightly husky and had been so since the operation. The chest expansion was normal on both sides, with normal breath sounds. The heart tones were good, the rate was regular and there were no murmurs.

SUMMARY



In a case of patent ductus arteriosus complicated by acute bacterial endarteritis due to Diplococcus pneumoniae type I, treatment with 3,875,000 units of penicillin sterilized the blood stream, permitting later surgical ligation of the ductus. The patient is apparently well ten months after the original period of treatment with penicillin.

## THE PRODUCTION OF AEROSOLS FROM MEDICATED SOLUTIONS

### A COMBINED STEAM GENERATOR AND AEROSOLIZER

SAMUEL J. PRIGAL, M.D.
Chief Allergy Clinic, New York Medical College, Flower and Fifth Avenue Hospitals
NEW YORK

Aerosol of penicillin, as advocated by Barach[1] after Bryson's[2] preliminary observations, is finding increasing use in the treatment of diseases of the upper and lower respiratory tracts. The method described by Barach consists in a special nebulizer containing concentrated solutions of penicillin in saline solution. Oxygen flowing through the nebulizer produces an aerosol of penicillin which can then be inhaled. To conserve the penicillin a rebreathing bag as well as a Y tube has been inserted into the circuit. The oxygen here is used primarily as a driving force. This led to the use of a cheaper source of power, namely, steam, and it was possible to convert a device[3] originally designed for the dispersion of solutions of insecticide for the purpose of producing medicated aerosols. To this apparatus has been added a valve for controlling the onset and rate of production of the aerosol.

Combined steam generator and aerosolizer.

The apparatus consists of a container sturdily constructed, which holds 16 ounces of water. Suspended from the lid into the chamber of water are electrodes which connect to an outlet of current. From ten to fifteen minutes after plugging into the current, steam begins to emerge from the spout. This spout is especially designed to allow a thin trickle of steam to pass over a fine tube with which it is connected and which extends into the container holding the medication in solution. Excess steam unable to escape through the spout emerges through a safety valve located on the lid. This safety valve can be regulated to work at different pressures. (The internal pressure can vary from 8 to 50 pounds.) The rapid passage of the steam creates a vacuum in the tube, allowing the medication to be drawn up and expelled from the nozzle in a fine mist mixed with the steam. To control the onset of flow of medication and its rate of flow, a special screw valve was designed. Thus, with the screw turned open, no medication will flow, even though the steam is escaping. As the screw is tightened, the flow of medication is increased. A given amount of medication can therefore be aerosolized in any length of time, as desired. The 16 ounces of water is consumed in twenty to twenty-five minutes, and the absence of water automatically shuts off the current, further enhancing the safety of this generator. The water can readily be replaced by unscrewing the safety valve and filling by means of a funnel. Steam can be generated for hours, if necessary.

Preliminary studies reported elsewhere[4] indicated that the brief contact with steam caused slight or no alteration of penicillin. The rapid expansion of the steam emerging from the small apperture of the nozzle cools it considerably, so that it may be inhaled with safety.

The combined steam generator and aerosolizer has the following advantages:

1. It is cheap, sturdy, small and conveniently handled.
2. It can readily be used in the home and office as well as the hospital. It works best on alternating current.
3. The apparatus and method are so simple that self administration is readily learned.
4. Larger amounts of solution can be aerosolized than with the present method.
5. The aerosol produced is warm and moist, and this may enhance its effectiveness.
6. It is possible to produce mixed aerosols (penicillin, sulfadiazine, penicillin and aminophylline, and others).
7. Aerosols need not be limited to aqueous solutions. Our best blood levels[5] of penicillin were obtained with aerosols of penicillin dissolved in propylene glycol.
8. Safety features, including a decompression valve and an automatic circuit breaker when no water is left, make it fool proof. There are no fire hazards, as with oxygen.

The aerosol produced by this device may be administered by simple inhalation (as with the old fashioned steam kettle), by confining the patient to a small chamber into which the aerosol is blown, by confining the aerosol in a tent covering the patient and by confining the aerosol in a box from which the patient breathes. These methods and the blood levels of penicillin obtained with each will be reported. Suffice it to say that excellent therapeutic levels of penicillin of five to six hours in duration have been obtained using penicillin in propylene glycol and the tent or breathing box for the purpose of confining the aerosol.

This device has also been used in the treatment of asthma with aerosols of aminophylline to relieve bronchospasm. The aerosol may succeed at times even after failure with aminophylline intravenously.[6] Ammonium chloride in aerosol form[6] has also been administered to a limited number of patients to liquefy the thick tenacious sputum commonly seen in asthma. These studies are continuing.

# Council on Foods and Nutrition

*The Council on Foods and Nutrition has authorized publication of the following report*

JAMES R. WILSON, M.D., *Secretary*

## ENRICHED 80 PER CENT EXTRACTION FLOUR

The Council has noted with approval and endorses the decision of the millers and bakers of this country to enrich 80 per cent extraction flour and bread made with such flour The Council was among the first to advocate additions of thiamine to white flour and early endorsed the enrichment of white flour and white bread with niacin, riboflavin and iron as well as with thiamine according to standards developed at the public hearings of the Federal Food and Drug Administration The advantages of this enrichment will be largely lost unless enrichment is also applied to 80 per cent extraction flour and bread made with such flour Eighty per cent extraction alone will not accomplish that for which enrichment was designed.

The white flour in popular use for the last sixty years or more has represented a variable fraction of the wheat from which it was extracted. This fraction has been 72 per cent or less In other words, each 100 pounds of wheat yielded no more than 72 pounds of flour or, in the case of many 'patent" flours, only 58 to 60 pounds The remainder of the wheat, consisting mainly of the outer coatings, went into feed for stock. The outer coatings carried with them about seven eighths of the thiamine and niacin, three fourths of the riboflavin and four fifths of the iron, together with other nutrients of the wheat kernel Enrichment was developed as a partial remedy for these losses The standards for enrichment are such that the amounts of thiamine, niacin and iron in the finished flour approximate those present in whole wheat, while the amount of riboflavin considerably exceeds that contained in wheat.

Eighty per cent extraction flour is now manufacturered in compliance with War Food Order 144, effective March 1, 1946 The order requires that 'no miller shall produce any flour which consists of less than 80 per cent by weight of the cleaned wheat from which such flour is produced." This procedure is unquestionably desirable if, as is expected by its advocates, it results in saving flour for shipment overseas The flour also has some small nutritional advantages particularly with respect to certain protein qualities The serious disadvantage is the fact that to date the iron, thiamine, riboflavin and niacin values of 80 per cent extraction flour are decidedly variable but in the case of each of these four nutrients the levels consistently fall far short of the levels present in enriched flours Unenriched 80 per cent extraction flours carry around half or less than half as much thiamine, niacin and iron and less than 20 per cent as much riboflavin as enriched flour If, therefore, the 80 per cent extraction flours and bread made from such flours were not enriched, the result would be a decided reduction of the advantages to the American diet previously achieved through the enrichment of flour of lower extractions and breads made from such flour

On the other hand the 80 per cent extraction flour if enriched, as is now proposed by the milling and baking industries, is nutritionally superior to the flour it replaces Its baking qualities have been stated by bakers to be acceptable to the commercial bakers Whether the home baker will find it satisfactory will soon be seen, and time will tell whether it has sufficient keeping qualities for satisfactory marketing in the high temperatures prevailing in this country in the summer months

Enrichment of white pan bread became mandatory in this country through War Food Order Number I, but war food orders cease with the "official' ending of the war and flour enrichment never has been required by federal legislation. Laws requiring enrichment have been adopted by nineteen of the forty-eight states as well as by the legislatures of two territories Similar legislation was defeated in several other states, the defeat resulting mainly because of opposition by the dry milk industry It is hoped that this opposition will be withdrawn and that enrichment may be made obligatory in all the states However, until that is accomplished, it will continue to be important for purchasers of white bread and white flour to demand products which carry on their labels the word "enriched" Federal laws do not require enrichment, except temporarily, for white bread They do, however, penalize untruthful labeling, and the word "enriched" can safely be displayed on packages of bread or flour only when the products contain the nutrients specified by the federal standards established for enriched white bread and enriched white flour

# Council on Pharmacy and Chemistry

## NEW AND NONOFFICIAL REMEDIES

*The following additional articles have been accepted as conforming to the rules of the Council on Pharmacy and Chemistry of the American Medical Association for admission to New and Nonofficial Remedies A copy of the rules on which the Council bases its action will be sent on application*

AUSTIN SMITH, M.D., *Secretary*

**PERTUSSIS IMMUNE SERUM (HUMAN)**—Hyperimmune Whooping Cough Serum (Human)—A sterile serum prepared from the pooled blood of healthy adult human beings who have had "whooping cough" in childhood and who have received repeated courses of Phase I Pertussis Vaccine. The bloods to be pooled and processed are drawn about one month after a course or courses of vaccine, when the donor's serum agglutination titer is 1 2,560 or higher The serum may be distributed in the liquid form or as a vacuum dried powder It complies with the requirements of the National Institute of Health of the United States Public Health Service.

*Actions and Uses*—Vacuum dried serum may be administered intravenously or intramuscularly for prophylaxis and treatment of "whooping cough"

*Dosage*—When exposure is only casual or of short duration, 20 cc. may be administered. Otherwise two 20 cc. doses may be give at three to five day intervals

For treatment three 20 cc. doses at forty-eight hour intervals may be injected. A fourth dose may be necessary Critically ill infants may be given 60 to 100 cc. intravenously, repeated one or more times.

PHILADELPHIA SERUM EXCHANGE, CHILDREN'S HOSPITAL OF PHILADELPHIA, PHILADELPHIA

**Pertussis Immune Serum (Human)** Vials containing vacuum dried powder representing 20 cc. of Pertussis Immune Serum (Human) preserved with merthiolate 1 35,000 Each vial is packaged with a 10 cc. ampul of sterile distilled water

**THEOPHYLLINE ETHYLENEDIAMINE** (See New and Nonofficial Remedies 1945, p 388)

The following dosage forms have been accepted

CARROLL DUNHAM SMITH PHARMACAL COMPANY, ORANGE, N J

**Solution Aminophylline with Benzyl Alcohol 2%** Ampuls 0 5 Gm. in 2 cc.

**Solution Aminophylline** Ampuls 0.5 Gm in 20 cc.

**Tablet Aminophylline** 0 1 Gm

**EPHEDRINE SULFATE** (See New and Nonofficial Remedies, 1945, p 285)

The following dosage forms have been accepted

PREMO PHARMACEUTICAL LABORATORIES, NEW YORK

**Ephedrine Sulfate *(Powder)*** 15 Gm., 30 Gm. and 120 Gm

**Capsules Ephedrine Sulfate** 24 mg., 32 mg and 50 mg

**PENICILLIN** (See New and Nonofficial Remedies, 1945, p 214)

The following additional dosage form has been accepted

WINTHROP CHEMICAL CO., INC., NEW YORK

**Penicillin Sodium** 200,000 Oxford unit vials.

## OIL TREATMENT OF BEDCLOTHES FOR THE CONTROL OF INFECTION

In the dissemination of infection, micro-organisms dispersed into the air when contaminated bedclothes are agitated play a considerable part Puck and his associates[1] point out that mineral oil, because of its hydrocarbon structure, has a lower surface tension and therefore a higher tendency to spread than any of the other common liquids, hence its capacity to engulf new particles will be great even when it is present in only minute quantities Water soluble liquids possess high polar chemical radicals, these groups strongly attract one another, hence molecules containing them will resist being separated, as must happen if the liquid is to flow over the newly acquired particles A water soluble compound which might theoretically regulate dust as effectively as does oil would probably not be effective because of the presence of the chemical groups that make a water soluble molecule a poorer spreading agent than mineral oil A number of commercial processes have been advanced with the claim that they render bedclothes and wearing apparel self sterilizing However, fabrics impregnated with high concentrations of strongly bactericidal substances, such as Zephiran, failed to produce any killing of dried bacteria allowed to settle on them Furthermore, they exhibited only moderate bactericidal action when the micro-organisms were deposited in droplets produced by atomization The investigators point out that these commercial processes will not be effective, except possibly toward liquid suspensions of micro-organisms that happen to wet the fabric, unless some agent can be incorporated to bring about intimate contact between the bacteria and the germicide

The authors have developed two oil-in-water emulsions, both of which can be used to deposit mineral oil in sheets and blankets in amounts appropriate for preventing the dispersal of dust and bacteria from them into the air These emulsions are nontoxic and non-irritating to the skin and can be readily applied to bedclothes in the course of the ordinary laundry procedure One of these, triethanolamine oleate emulsion, presents some difficulty in routine use because of its tendency to separate when stored in drums and to rancidify in blankets The other emulsion, T-13, employs Triton NE as the emulsifying agent, it is said to be free from both of these disadvantages and also to permit more accurate control of the amount of oil deposited in the fabrics Neither bactericidal substances alone nor water soluble dust-laying agents are as effective as mineral oil in preventing aerial dissemination of bacteria from contaminated bedding

Loosli and his associates[2] confirm the conclusion that mineral oil is by far the most effective agent for controlling the aerial dissemination of dust and bacteria from fabrics Of the two emulsion bases described, T-13 more nearly meets all the criteria set up for the oil treatment of textiles A number of observations on its usefulness and limitations were made during the course of the study by the Commission on Air-Borne Infections in collaboration with the Commission on Acute Respiratory Diseases on the control of respiratory diseases by the oil treatment of floors and blankets The oil emulsion base T-13 is composed of 87 per cent by weight of medicinal mineral oil and 13 per cent Triton NE, the emulsifying agent The latter is a 30 per cent aqueous solution of an aryl-alkyl-polyether alcohol The preparation of oil emulsion base T-13 is carried out by mixing in a suitable agitator the correct quantities of mineral oil and Triton NE until a thick white paste is formed The treatment of cotton and woolen fabrics with dilute T-13 oil emulsions is carried out as the final step of the washing procedure simply by adding the required amount of oil emulsion base to the washwheel containing the washed and rinsed textiles Blankets, cotton bedclothing and cotton and woolen wearing apparel containing from 2 to 5 per cent oil, by dry weight, are indistinguishable from the untreated fabrics in appearance, texture and touch. The treated materials are odorless During the period from October 1944 to April 1945 several thousand men have slept in bedding treated in T-13 oil-water emulsions There has not been a complaint of skin irritation Oiled bedding in conjunction with oiled floors gives the barracks a cleaner appearance and an atmosphere free of dust

Woolen blankets treated with T-13 oil emulsion and containing from 2 to 3 per cent oil yielded 90 per cent fewer bacteria than the untreated ones The oil treated blankets also showed 77 per cent fewer positive beta hemolytic streptococci than did the corresponding control samples Furthermore, in the positive cultures there were 80 per cent fewer streptococci recovered per culture from treated blankets as compared with untreated ones

1 Puck T T Robertson O H Wise, H, Loosli C. G, and Lemon, H. M Oil Treatment of Bedclothes for the Control of Dust Borne Infection I Principles Underlying the Development and Use of a Satisfactory Oil in Water Emulsion Am J Hyg 43:91 (March) 1946

2 Loosli C G Wise, H Lemon H M Puck, T T and Robertson O H Oil Treatment of Bedclothes for the Control of Dust Borne Infection II Use of Triton Oil Emulsion (T 13) as a Routine Laundry Procedure Am J Hyg 43 105 (March) 1946

The observations reported indicate that oil treated bedding will retain its bacteria and dust-holding efficiency for long periods if dust-laying measures are used on the floors as well The diminution of infections of the respiratory tract by the use of dust control measures appears to be feasible Additional data as to the advantages and limitations of this technic in relation to other preventive procedures are needed before the effectiveness in controlling infection can be clearly evaluated

## THIAMINE AND ESTROGEN IN UTERINE CANCER AND MENORRHAGIA

The work of Allen [1] with castrate monkeys and of Shorr and his associates [2] with human beings has shown that estrogens can produce enormous proliferative growth of the vaginal epithelium with an increase in the number of growing bulbs along the basement membrane, the cells containing many mitotic figures The chemical similarity of the carcinogenic substances of certain coal tar products to some of the active substances in the sex hormones has been established Rhoads [3] has demonstrated the protective action of a diet rich in vitamins of the B complex against induced cancer in rats to which the two benzene ring substance "butter yellow" has been administered Ovarian tissue implants in mice have produced cancer of the breast in cancer susceptible animals, this fact has been thought to implicate some secretion of the ovary in the production of cancer Henry [4] has reported 2 cases in which the prolonged administration of diethylstilbestrol has been followed by the discovery of malignant growths in the uterus Hodgson and his associates [5] after surveying estrogenic activity in 62 cases of granulosa cell tumors, reported proliferative endometrium in 67 per cent and concluded that "this phenomenon of coexistent ovarian, endometrial and mammary carcinoma in the human being bears a marked similarity to the results of experiments on laboratory animals in which estrogen stimulation appears to be a factor in carcinogenesis"

While further investigation is needed to clarify the exact relation of the liver to estrogen metabolism, the Biskinds [6] found that the liver loses its ability to inactivate estrogen in B complex deficiency in female rats and that this can be controlled at will by the administration of vitamin B complex or its restoration in the diet Further, Singher and his associates [7] have demonstrated that the inactivation of estradiol in liver slices is dependent on the concentration of thiamine and riboflavin in the liver, possibly through the role of these vitamins as part of an oxidative enzyme system The protection of the liver by vitamin B against many toxic agents is well known, Gyorgy and Goldblatt [8] reported that cirrhosis of the liver may result from nutritional deficiency Menorrhagia and metrorrhagia may occur early in the course of cirrhosis of the liver The work of the Biskinds indicated that administration of large doses of B complex and liver extract correct the functional disorders of a large percentage of cases of menorrhagia and metrorrhagia

In an attempt to correlate these factors of B complex deficiency, decreased liver function (in which liver block of estrogen deactivation may occur), and high estrogen activity, Ayre and Bauld [9] studied two series of 150 and 20 cases of proved uterine cancer These authors used as the simplest and most sensitive measure of estrogen activity the specific hormonal cornification reaction in the squamous epithelial cells of vaginal and cervical smears, first described by Allen This cornification with accompanying proliferative growth is related to the deposition of glycogen in these cells under the mediation and control of the estrogenic stimulus Smears were examined before and after the administration of thiamine and other constituents of the B complex and liver extract Although vitamin and liver function studies were incomplete, a definite relationship was noted between the intake of B complex and the rise and fall of estrogen levels

Three patients with similar cytologic findings were investigated as to their nutritional biochemical status by a vitamin tolerance technic All presented abnormal bleeding Abnormally high estrogen levels demonstrated by the cytologic smears were verified by the endometrial patterns The first patient, aged 64, exhibited an early rapid growing, undifferentiated, squamous carcinoma of the cervix, pathologic tissue study of the second patient, aged 29, with a suggestive erosion about the external cervical os, justified the diagnosis of a squamous intraepithelial carcinoma or a precancerous secondary hyperplasia, microscopic study of the third patient, a girl aged 14 years with puberal bleeding following a total dental extraction, presented an appearance of overstimulated proliferative glands with mitosis and adenomatous formation Lower than normal excretion values for thiamine and riboflavin were found The other B factors were normal in amount Liver function tests presented uncertain results

Over 66 per cent of the first series of 150 proved cases of uterine cancer demonstrated evidence of abnormally high endogenous estrogenic activity In the supplemental series of 20 patients with proved uterine cancer 90 per cent were found to have a low thiamine excretion with an abnormally high estrogen level The

average thiamine excretion level was less than half that of controls with normal estrogen levels. Twenty per cent of this group also showed deficient excretion of riboflavin. The same correlation was demonstrated in a similar series of menorrhagic patients. Controls of nongynecologic cases did not show similar vitamin B deficiencies.

Ayre and Bauld state that it has long been the feeling among gynecologists that dietetics was not directly concerned with the production of pelvic pathologic changes and that the need for vitamins in particular was generally overstressed. However, in the light of this investigation, the nutritional status of gynecologic patients on supposedly adequate diets should be studied carefully with reference to the intake and metabolism of thiamine and other components of the vitamin B complex. Fixed habits of diet and dietary errors over long periods of time may produce unrecognized chronic deficiencies. These may act on the liver in man as in animals and thus allow the accumulation of estrogens in the body and permit them to act as a growth stimulant to estrogen susceptible tissues such as the pelvic organs and possibly also the glands of the breast. Two tests are recommended by the authors: (1) a cervical cytologic test to tell (*a*) whether the patient has uterine cancer and, (*b*) if not, whether the endogenous estrogen level is abnormally high, and (2) a test of the urinary thiamine level.

Ayre and Bauld conclude that there appears to be excellent circumstantial evidence that nutritional deficiency may be a primary factor in the production of uterine cancer and that recognition of this possible dangerous precancerous linkage of low thiamine and abnormally high estrogen may permit correction and possible prevention of cancer. Further investigation is needed before critical evaluation of this important correlation can be made.

## EQUIPMENT FOR THE CALLING OF MEDICINE

C. H. Browning,[1] in an address recently delivered before the Southern Medical Society (Scotland), expressed skepticism as to the validity of present day methods of training physicians. He feels that our methods leave much to desire in the selection of medical students. The capacity to excel in examinations may be associated with good general gifts but need not necessarily reflect the candidate's qualities of originality or common sense, much less his enthusiasm for the subject of his studies. Browning feels that the only way to surmount this difficulty would be the wasteful one of accepting applicants on a lavish scale but with due warning that rejection may occur at any time up to the end of the second professional stage. During this period the teacher should come into an intimate contact with each student, being sympathetically although critically observant of his personality and performance. Definite promise in any subject should be held to more than counterbalance a poor average or even a particular weakness. Rejection before the end of the second professional stage would be premature, because there are those of good ultimate promise who are late in finding themselves. Written examinations of the usual type should play only a minor part in deciding a student's progress. Powers of observation should be tested by capacity for description either in words or with the pencil, and watch should be kept for evidence of sound judgment and ability to draw conclusions. The system of written examinations does not, in his opinion, test these qualities except to a minimal degree, while a premium is placed on memory.

Browning places great stress in the preparatory period on cultural studies. The acquisition of the faculty of clear and accurate expression in one's own language and appreciation of fine examples of its literature will insure enjoyment for a lifetime. He believes that "a little Latin" is good when regarded as yielding access to much of the source of our language, otherwise it is to most just like elementary mathematics, an exercise in logic but devoid of the interesting and valuable applications to real life that mathematics possesses. Greek is probably a luxury most students could afford to forego, especially since effort spent on literary English will open the masterpieces of the classical languages in translation. A similar time spent on their linguistics will usually fail to do this. The sciences should be taught to enlighten and also to whet the student's curiosity and wonder about the phenomena of the world. An essential objective in these school years is exercise of the hands, together with training in power to use the senses.

Browning considers the first year of the medical studies "a nightmare." He believes it a herculean task to impart in nine months a knowledge of the fundamental principles of four sciences and also a smattering of their experimental technics. Anatomy should be excluded at this stage. Pathology, including morbid anatomy and biochemistry, is the basis of medicine and surgery. Every student should be provided with a schedule of conditions with whose nature, recognition and treatment he would become familiar by actual experience. The courses should be simplified to afford a sound scientific basis, culminating in a thorough understanding of pathology, both structural and functional. Clinical instruction in common diseases and obstetrics could be introduced early by deleting instruction in purely manipulative expert performances. The abolition of operative surgery as practiced on the cadaver marks a radical change in this direction, but probably more will be required, such as reduction to a minimum of attendance in the operating theater.

Browning feels that it is much more difficult to produce a competent general practitioner than a specialist

1. Browning, C. H.: Equipment for the Calling of Medicine, Glasgow M. J. 27: 63 (March) 1946.

The general practitioner must deal with every conceivable emergency, must know when specialist help is required and, if such help is not available, do the best that circumstances allow Barring exceptions, the general practitioner has little opportunity to add to the fundamental knowledge acquired as an undergraduate He has little opportunity to meet with authorities who are in a position to review new ideas in the light of practical experience Browning therefore reiterates the commonly accepted recommendation that retention of licensure depend on return to a teaching center for at least three months every three or four years for courses designed to keep the practitioner in touch with current methods

## Current Comment

### STREPTOMYCIN THERAPY OF EXPERIMENTAL SYPHILIS

Dunham and Rake[1] of the Squibb Institute for Medical Research infected several groups of rabbits intracutaneously in the clipped skin of the back with suspension of rabbit testes infected with the Nichols strain of Treponema pallidum Within three days intravascular injections of streptomycin were begun and repeated every four hours for four days When lesions developed at the site of the intracutaneous inoculation their syphilitic nature was confirmed by dark field examination All apparently negative rabbits were kept for at least four months, when a suspension of the popliteal lymph nodes of each rabbit was injected intratesticularly into 2 rabbits If the testes of these 2 rabbits remained normal, the donor rabbit was judged to have been cured None of the four rabbits in the group that received a total of 374,000 or more units per kilogram developed lesions Of the 4 rabbits that received a total of 187,000 units per kilogram only 1 developed a chancre All rabbits that received a total of 93,500 units or less per kilogram and all untreated controls developed typical lesions The smallest dose of streptomycin that cured any of the rabbits was 79,000 units per kilogram in one group and 187,000 units in another Parallel tests showed that a similar effect could be obtained with as little as 147 units of crystalline penicillin G From these and other data Dunham concludes that if used in adequate doses the preparations of streptomycin employed by him were effective antisyphilitic agents Unit for unit, however, crystalline penicillin G was at least three thousand times more effective This conclusion is in line with therapeutic data recently reported by Herrell and Nichols[2] of the Mayo Clinic Herrell treated each of 4 cases of syphilis with 10 million units of streptomycin over a period of ten days Improvement was noted, but relapses occurred in all cases Assuming that each patient weighed 150 pounds (68 Kg ), his dosage would be equivalent to 150,000 units per kilogram This is less than the effective therapeutic dose for experimental rabbit syphilis

### COMPLICATIONS OF THERAPEUTIC MALARIA

Read and his associates[1] studied the complications encountered during therapeutic malaria given to 300 patients, 75 per cent of whom had asymptomatic neurosyphilis The treatment included ten to twenty-five malarial paroxysms during an eleven month period Two hundred and eleven of these completed therapy with Plasmodium vivax and 89 with Plasmodium malariae There were 22 cases of jaundice, but jaundice did not develop after the termination of malaria therapy in spite of the fact that ten daily injections of oxophenarsine hydrochloride were administered in approximately 35 per cent of the cases during the period of convalescence. Palpable enlargement of the liver developed in 74 cases (24 7 per cent) Splenomegaly was found in 242 cases (80 7 per cent), in most of which (203 cases) treatment with vivax malaria was given Of the 22 per cent with jaundice, 9 were without gastrointestinal complaints and repeatedly showed negative direct van den Bergh reactions but increased blood bilirubin Icterus in these cases was considered to be the result of excessive red cell hemolysis Cephalin flocculation tests were positive during active malaria in every one of 102 patients who had had this test performed Of the 13 patients with severe hepatic dysfunction, 2 showed remarkable improvement on supportive therapy, consisting of glucose infusions and a high carbohydrate and protein diet without requiring interruption of malaria Nineteen patients in this series had edema of the ankles during malaria therapy A low total serum protein (less than 5 8 Gm ) with a decrease in serum albumin to less than the critical level of 3 Gm was found in 11 cases The authors felt that most of the cases of unexplained edema were probably due to individual variations in response to hypoalbuminemia, but some may have been initiated by transient anoxemia with increased capillary permeability during each malarial paroxysm, when large numbers of red cells were being destroyed Acute nephritis complicated the courses of 4 patients, who recovered completely from the acute attack following bed rest, controlled fluids, high protein diet and termination of malarial therapy There were 10 instances of neuritis, 7 of which were caused by vivax malaria The peripheral nerve syndromes included trigeminal neuralgia, the ophthalmic branch, in 2, involvement of the greater occipital nerve in 2, brachial plexus neuritis in 3, ulnar neuritis in 2 and peroneal neuritis in 2 The duration of these neuritides varied from five to thirty-five days Thirteen patients developed respiratory difficulty unaccompanied with pneumonitis Four presented precordial pain and dyspnea, 4 asthmatic wheezing, 2 severe dyspnea and cyanosis, 2 moderate dyspnea and 1 functional dyspnea Except for the asthmatic, none were left with residual symptoms or signs following completion of malarial therapy There were two fatalities in this series, one being caused by spontaneous rupture of the spleen, while the other was apparently

1 Read H S Kaplan, L. I and Becker F T An Analysis of Complications Encountered During Therapeutic Malaria Ann Int. Med **24** 444 (March) 1946

due to hypocalcemic tetany. Although jaundice, edema, mild renal damage and neural syndromes are relatively common features of untreated malarial infection, none of these are followed by a permanent sequela. The neurologic and psychiatric manifestations of vivax and quartan malaria are mild and are readily amenable to antimalarial therapy. Therapeutic malaria, although somewhat different in its course from natural malaria, nevertheless presents an opportunity for the clinical study of the various manifestations of the disease.

## SOCIAL MEDICINE IN OLD AGE

Estimates indicate that over 20 per cent of the population of Great Britain will consist of women over 60 years of age or men over 65 by the year 1971. Howell[1] has recently discussed certain social problems involved in caring for the enlarged population of the elderly. The provision of domestic help during illness, especially for those who are living alone, is more than just an individual problem. By providing domestic help in such emergencies the entry of many older persons into institutions may be deferred, often for several years. The institutions for elderly people should be more differentiated in type and, where possible, should be much more homelike than they are at present. A more humane approach is indicated when elderly couples are in an institution, strict segregation of the sexes is often a practical cruelty which could easily be avoided. Sympathy for the sorrows of old age is not enough, Howell says, and it is time to translate it into action.

## POLICE TRAFFIC SAFETY CHECK

The toll of injuries and deaths due to highway accidents following the removal of gasoline rationing is growing. The National Committee for Traffic Safety has been organized, in this activity the American Medical Association participates with more than one hundred other agencies. The President of the United States has called a Traffic Safety Conference to meet in Washington May 8-10. Among the agencies which will go into definite action earliest is the International Association of Chiefs of Police, which through its safety division is sponsoring the police traffic safety check. This safety check was begun May 15 throughout the United States and will be followed up intensively through July 7. It is a follow-up of the brake emphasis program conducted in the spring of 1945. The chiefs of police request the cooperation of all agencies interested in reducing traffic casualties. They offer for local use a comprehensive service of publicity, including posters, leaflets, booklets, newspaper stories, pictures and cartoons, suggested advertising and information for radio talks and spot announcements. The active interest of the American Medical Association in this important project can be supported by state and local medical societies through publicity in their journals and bulletins and by participation in local community groups which will be organized throughout the nation immediately subsequent to the President's conference. In the meantime the highly important police traffic safety check can be supported locally by active cooperation. Further information is available from the International Association of Chiefs of Police, 1704 Judson Avenue, Evanston, Ill.

## INTERNATIONAL BIOLOGIC STANDARDS

Among the activities of the League of Nations were some which were successfully pursued. The activities of the Health Organization of the League of Nations for promoting biologic standardization have been of inestimable value to physicians and scientists throughout the world. Gautier[1] has reviewed the work of the Health Organization's Permanent Commission on Biological Standardization and its record in establishing and defining international standards for important drugs. Since 1922, when the first international standard—that for diphtheria antitoxin—was established, standards have been adopted for thirty-five substances. Of these, thirteen concern bacterial serums or antitoxins, five standards for vitamins, seven miscellaneous drugs such as the arsphenamines and penicillin, and ten various hormones. Such international standards enable comparison of the results obtained in laboratories of one country with those of another country. The character of the scientific work on which the international standards have been established has been described by Hartley.[2] The cooperation of the best laboratories throughout the world and the advice of an international group of scientists have guided the Health Organization in this work and insured the adoption of standards only after their permanence and reproducibility have been demonstrated. As a corollary to their work on biologic standardization, the Health Organization has been attempting a unification of pharmacopeias. Although the Unified Pharmacopeia has not been widely adopted, the work is still proceeding. Eventually there may be general recognition of the need for an international pharmacopeia. When that time comes, the groundwork will have been laid. The United Nations Charter contains provisions for carrying on the work of the Health Organization. This will insure the continuation of a form of international cooperation of immense value to biologists and physicians throughout the world.

## ENRICHMENT OF FLOUR

The Council on Foods and Nutrition, elsewhere in this issue (page 399), announces approval of the decision of millers and bakers to enrich 80 per cent extraction flour and bread made with such flour. Such enrichment is desirable because unless it is done the flour will contain less than half as much thiamine, niacin and iron and less than 20 per cent as much riboflavin as when the flour is not enriched. This step can be looked on as a useful measure to improve the nutrition of the American people.

2. Hartley, Percival: Bull. Health Organ. League of Nations 12:76-98, 1945-1946.

# REPORTS OF OFFICERS

*NOTE—At the 1925 session of the Association, the House of Delegates suggested that all reports of officers, committees, etc, and resolutions to be brought before the House, if available, be published in advance of the session so as to permit careful consideration and discussion—Ed*

## REPORT OF THE SECRETARY

*To the Members of the House of Delegates of the American Medical Association*

The following report of the Secretary is respectfully submitted

On April 1, 1946 Dr Olin West resigned as Secretary and General Manager of the American Medical Association Dr West came to the Association as Field Secretary in April 1922 and was appointed in November 1922 by the Board of Trustees subsequent to the death of Dr Alexander R Craig to serve as Secretary until the next meeting of the House of Delegates He was elected Secretary by the House in June 1923 and since that time had been reelected each year The undersigned was appointed by the Board of Trustees to serve as Secretary of the Association until the House of Delegates meets in July

### MEMBERSHIP

The number of members of the American Medical Association is constantly increasing On Dec 31, 1944 the official membership list contained the names of 124 595 members On the corresponding date in 1945 there were 125,471 members enrolled Because a reapportionment of delegates is made every third year based on the number of members recorded on April 1 of the reapportionment year it has been customary to report annually the enrolment as of that date. On April 1 1945 125 302 members were enrolled On April 1, 1946 the recorded membership was 126,835, showing a gain in twelve months of 1,533

### FELLOWSHIP

There were 67,567 names on the Fellowship roster on Dec. 31, 1945 as compared with 68 637 the preceding year It is anticipated that with the return to civilian practice of thousands of medical officers the number of Fellows will increase steadily In the twelve month period from April 1 1945 to April 1 1946 the deaths of 964 Fellows were recorded the names of 491 Fellows were dropped because of nonpayment of dues and 360 resigned their Fellowship for various reasons On April 1, 1946 68 366 Fellows were enrolled

The usual table showing the organization of constituent state medical associations is included in this report

### REAPPORTIONMENT OF DELEGATES

Section 3 of chapter I of the By-Laws of the Association which provides for a reapportionment of delegates every third year, reads as follows

SEC 3 APPORTIONMENT OF DELEGATES—At the annual session of 1925 and every third year thereafter the House of Delegates shall appoint a committee of five on reapportionment, of which the Speaker and the Secretary shall be members The committee shall apportion the delegates among the constituent associations in accordance with Article 5 Section 3 of the Constitution and in proportion to the membership of each constituent association as recorded in the office of the Secretary of the American Medical Association on April 1 of the year in which the apportionment is made This apportionment shall take effect at the next succeeding annual session and shall prevail until the next triennial apportionment whether the membership of the constituent association shall increase or decrease (As amended 1925)

The last apportionment was made at the annual meeting held in Chicago in 1943 A new apportionment is due to be made at the 1946 session of the House of Delegates

### PROPOSED AMENDMENTS TO CONSTITUTION AND BY-LAWS

At the meeting of the House of Delegates in December 1945 Dr Henry A Luce, delegate of the Michigan State Medical Society, offered an amendment to the Constitution article 5, section 3 proposing that the figure 176 be substituted for the figure 175 in the second line of that section so that the first sentence of section 3 article 5 will read 'The total voting membership of the House of Delegates shall not exceed 176 Under the provisions of the Constitution and By Laws, it will be possible for the House of Delegates to take action on this proposed amendment at the 1946 meeting

A resolution was introduced by Dr L S Goin, delegate of the California Medical Association, at the December 1945 meeting of the House of Delegates as follows

*Resolved That section 2 of chapter XII of the By Laws be amended by striking out the words and subscribe to THE JOURNAL and further amend section 2 chapter XII by inserting after the words 'is disapproved by the Judicial Council (line 8 p 30) a new sentence to read Fellows shall receive THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION*

Since this proposed amendment to the By-Laws was submitted to the House on the last day of the 1945 meeting, action could not be taken until the next meeting of the House of Delegates

The Reference Committee on Legislation and Public Relations at the December meeting of the House approved the suggestion of President-Elect Roger I Lee that two meetings of the House of Delegates be held each year and recommended that an amendment to the By-Laws be prepared for consideration at the 1946 session The report of the reference committee was approved The Board of Trustees has had the matter under consideration and will offer a report to the House.

### Annual Conference of State Secretaries and Editors

The annual conference of secretaries of constituent state medical associations and editors of state medical journals, which usually is held late in November each year, was postponed in 1945 because of adverse travel conditions and also because the meeting of the House of Delegates was set for the first of December

The conference was held on Feb 8 and 9, 1946 Nearly every constituent state medical association was represented at the conference, as were practically all the state medical journals A large number of other officials of state medical associations and representatives of several component county medical societies were also present This conference affords a valuable opportunity for the administrative and other officers of the constituent organizations to exchange ideas on all sorts of problems to the end that the efficiency and usefulness of their own societies may be increased. It also gives those attending the conference an opportunity to become better acquainted with the scope of the work being done by the American Medical Association, since it is always held at the headquarters offices in Chicago Papers presented at the conference are the result of suggestions received from conference members and there is full and free discussion of any matters that may be brought up for attention

### In Appreciation

The Secretary wishes to express his gratitude for the kindly consideration and aid given him in his new position by the officers and members of official bodies of the Association The directing heads of the Bureaus and Councils and the personnel at the headquarters offices have given invaluable help and have rendered a very high degree of service Dr Olin West has drawn on the wealth of his experience to aid and assist the Secretary in every way possible.

Respectfully submitted,

George F Lull, Secretary

## REPORT OF THE BOARD OF TRUSTEES

*To the Members of the House of Delegates of the American Medical Association*

The following annual report of the Board of Trustees is respectfully submitted to the House of Delegates The activities of the various councils, bureaus and departments of the Association during 1945 are covered in this report and, because the annual meeting of the House was held so late in 1945, reference will be made to some matters that have received attention during the current year

### Resignation of Dr Olin West

On March 15, 1946, after twenty-four years of devoted service to the American Medical Association, Dr Olin West tendered his resignation as Secretary and General Manager to take effect on April 1 Because Dr West's own letter of resignation explains the acquiescence of the Board of Trustees better than anything else that could be said, it is reproduced in this report

Dr R L. Sensenich,
Chairman Board of Trustees
American Medical Association
South Bend, Indiana
Dear Doctor Sensenich

After careful consideration having conferred with elected officers of the Association in whose judgment I have complete confidence I hereby submit my resignation as Secretary and General Manager to take effect April 1 1946

For twenty four years under the splendid guidance of the House of Delegates and the Board of Trustees and with the excellent cooperation of the fine group composing administrative and other personnel I have lived and worked to the limit of my capacity to promote the great cause which the Association was created to serve. By force of the tides that flow in human affairs and in the course of unfolding destiny' to use the language of a noted statesman we live in a changing world Great and significant changes affecting our own nation have already developed and other changes impend Medicine will be affected in many of its relations to the public and otherwise as will be the course of action of the American Medical Association Many new problems have arisen within the recent past, and others are clearly in prospect. The duties and responsibilities of the office of Secretary and General Manager are constantly increasing in volume and weight and demand the attention and effort of a younger and more vigorous man than the present incumbent.

If I may do so with due propriety, I respectfully suggest that Dr George F Lull be appointed by the Board of Trustees to serve as Secretary of the American Medical Association until the next meeting of the House of Delegates Dr Lull has within the last three months familiarized himself with the nature of the policies and general activities of the Association and has won the friendship, confidence and respect of the office personnel

It is useless for me to attempt to express to the members of the Board of Trustees and others with whom I have been associated my gratitude for their heartening encouragement and support, their forbearance and all their kindnesses and for the great privilege of having had opportunity to serve in an effort to promote the aims and objects' of our society

Very respectfully yours
Olin West

### Appointment of Dr George F Lull

On Jan 1, 1946 Dr George F Lull, Major General, U S Army, became Associate General Manager of the American Medical Association Dr Lull retired from the Army after thirty-three years of distinguished service as an officer in the Medical Corps He was Chief of Personnel Service in the Office of the Surgeon General in Washington from 1940 to 1943, when he became Deputy Surgeon General Dr Lull was born in Pennsylvania March 10, 1887 and received the degree of Doctor of Medicine from Jefferson Medical College in 1909, a Certificate of Public Health from Harvard Technology School of Public Health in 1921 and the degree of Doctor of Public Health from the University of Pennsylvania in 1922.

On the retirement of Dr West the Board of Trustees appointed Dr Lull to succeed him as General Manager and to serve as Secretary of the Association until the meeting of the House of Delegates in July

### Mr Will C Braun

In November 1891 Mr Will C. Braun accepted a position with the American Medical Association, then located in a small rented office on North Wabash Avenue in Chicago, as a subscription solicitor and office helper The staff at that time consisted of less than ten persons On Dec 31, 1945, after fifty-four years of service with the Association in its Advertising and Business Department, Mr Braun became Business Manager Emeritus His voluntary retirement closes a career of most useful and devoted service to the Association. The circulation of The Journal, which was one of Mr Braun's primary responsibilities throughout the years grew from 3,500 copies in 1891 to 112,510 in 1945 Mr Braun's invaluable service in helping to keep the activities of the Association on a sound business basis has contributed immeasurably to the organization.

The Board of Trustees takes this opportunity to tender to Will C Braun the sincere and grateful appreciation of the American Medical Association for his many years of splendid service.

### Employment

The personnel problem in connection with the operation of the Association's headquarters offices has improved considerably since the last annual report was made to the House of Delegates Even now, however, it is not possible to secure the quantity of personnel necessary to carry on most effectively the constantly growing activities of the Association. Until V-J day the headquarters offices were relatively handicapped by the imposition of an employment ceiling of 482 employees working thirty hours or more a week. Shortly after the relaxation of employment controls, efforts were made to obtain necessary personnel

As of Jan 1, 1946 the Association had 548 employees on a full and part time basis and 597 as of May 1, 1946 This compares with a total of approximately 630 in March 1942

The normal operations of the Association have also been complicated by the intervention of other factors, such as personnel turnover due to the consequences of employment conditions in so-called war industries, current controversies in the printing trades in the Chicago area government imposed restrictions on the use of paper, and shortage of equipment and essential materials

### Matters Referred by House of Delegates

Several resolutions and suggestions adopted by the House of Delegates at the 1945 session were referred to the Board of Trustees for consideration and action, and the Board reports thereon as follows

Proposed Midwinter Session of House of Delegates At the 1945 meeting of the House of Delegates President-Elect Roger I Lee suggested that two sessions of the House be held each year This suggestion was referred to the Reference Committee on Legislation and Public Relations which approved the suggestion in principle and recommended that a proper amendment to the By-Laws be prepared for consideration at the 1946 session The report of the reference committee was adopted A question arose as to the necessity of amending the By-Laws, since it is already provided that a special session of the House can be called by the Speaker at any time on the written request of twenty-five or more delegates representing one third or more of the constituent associations or on request of a majority of the Board of Trustees However, that section of the By-Laws also provides that no business other than that which is specifically stated in the official call shall be transacted at the special session, and therefore, no new business could be introduced from the floor of the House. The Board of Trustees respectfully suggests that it would seem to be advisable to amend the By-Laws at the 1946 session in order to accomplish the purpose suggested by Dr Lee and approved by the House of Delegates

Proposed International Congress on Tropical Medicine and Malaria A resolution introduced at the last meeting of the House of Delegates by Dr Thomas K. Lewis, delegate of the Medical Society of New Jersey and restated by the Reference Committee on Miscellaneous Business, authorized the Board of Trustees to appoint a member of the American Medical Association to represent the Association at an International Congress on Tropical Medicine and Malaria being sponsored by the American Academy of Tropical Medicine. The Board of Trustees has appointed Col Thomas R Mackie as the official representative of the Association at the coming International Congress.

With respect to resolutions dealing with federal control of the practice of medicine and health legislation beneficial to the people, the report of the Council on Medical Service and Public Relations will show that the Association has been very active in carrying on an aggressive campaign to improve the public health and to provide a better medical service for more of the population

### Survey of Public Relations

The Board of Trustees obtained the services of the Raymond Rich Associates, a nationally known firm of public relations counsel to make an extensive survey of the public relations activities of the American Medical Association. This survey is being made on broad lines and has been in progress for a number of months The Board has the report under consideration and will make its findings available to the House of Delegates

### Income and Expenditures

The official reports of the Treasurer and of the Association's auditors are appended as a part of this report of the Board of Trustees

In 1945 the net income of the Association amounted to $990,708 81 and compares with $933 091.34 in 1944 an increase of $57,617 47

Wages and salaries paid in 1945 totaled $1 342,149 45, or $86,748 61 more than in 1944 Substantial increases in wage scales were negotiated by certain printing craft unions, particularly in the latter part of the year, which, together with others similarly effective, are not fully reflected in the total for 1945 Operating expenses other than wages approximated those of the previous year Greater activities of the councils bureaus and committees in 1945 is reflected in the larger disbursement of $537,611 66 for this group as compared with $459,740 12 in 1944

In 1945 $159 132 32 was expended in employees' annuities, miscellaneous expenses and legal fees representing $23,071 93 more than in 1944 when the amount was $136 060 39

The cost of publication of the Association's periodicals published in 1945 amounted to $1,808,381 36 as compared with $1,730 400 70 in 1944, or an increase of $77,980 66, largely accounted for in higher wages and paper costs Books, pamphlets and reprint sales and costs were approximately the same in 1945 as in 1944

Income from subscriptions to periodical publications totaled $1 332,631 22 in 1945 as compared with $1,303,043 68 in 1944 and advertising income amounted to $1,920 465 58 in 1945, as compared with $1,707,232 10 in 1944 Interest received from investments during 1945 amounted to $116,840.21, a gain over 1944 of $18,346 17

### The Journal of the American Medical Association

The end of the war made possible the reintroduction into THE JOURNAL of correspondence from most of the great medical centers in the world. THE JOURNAL now has correspondents who write regularly from London, Paris, Rome, Amsterdam, Brussels Stockholm, Oslo, Ankara, Jerusalem Tel-Aviv, Buenos Aires Rio de Janeiro, São Paulo and Mexico City No other medical periodical has ever attempted such coverage This feature has won acclaim for THE JOURNAL throughout the world

The end of the war made desirable regular publication in the pages of THE JOURNAL of the names and addresses of physicians released from the armed forces Only THE JOURNAL has attempted this feature, which again has proved of tremendous benefit to the medical profession and to the public.

Increasingly THE JOURNAL reflects current interest in social and economic problems related to medical practice A special section has been devoted to the Council on Medical Service and Public Relations The various conferences on medical care such as the regional conferences of the Council on Medical Service and Public Relations, the conferences on rural and industrial health and hearings before committees of the Senate and the House of Representatives have been covered in THE JOURNAL with a completeness not available in any other publication

The continued difficulty in securing paper and the pressure on printing facilities have made it impossible to enlarge THE JOURNAL to meet the increasing demand as much as would be desirable. However, some expansion already is taking place

THE JOURNAL receives each year as volunteered contributions of authors, between 2,000 and 2,500 manuscripts Not more than 400 of these volunteered manuscripts can be accepted for publication In selecting manuscripts the editor has to be guided by the interests of the readers, who include a large proportion of general practitioners as well as many representatives of each of the medical specialties The editor also endeavors through the editorials and the abstract features of THE JOURNAL to meet the needs of this varied audience

The place occupied by THE JOURNAL in the medical literature of the world may be estimated from the fact that the Board of Trustees has received requests since the end of the war for the right to publication of THE JOURNAL in whole or in part in German, Italian French Spanish and Portuguese. While it has not been possible to facilitate such arrangements the Board of Trustees has been lenient in authorizing republication in whole or in part of the contents of THE JOURNAL in other publications

The net paid weekly average circulation in 1945 was 111,407, compared with 109,828 in 1944 The weekly average of copies printed during 1945 was 112 460 compared with 111 386 in 1944

Table 1 shows the number of Fellows and subscribers on the mailing list of THE JOURNAL as of Jan. 1, 1946. Table 2 indicates the number of physicians in each state, the number receiving THE JOURNAL and the approximate percentage of subscribers in each state.

TABLE 1.—*Approximate Count of Fellows and Subscribers on The Journal Mailing List Jan. 1, 1946, Showing Gain or Loss*

| State | Fellows | Subscribers | Totals | Gain | Loss |
|---|---|---|---|---|---|
| Alabama | 5[illegible] | 304 | 923 | | 1 |

## Special Journals

The American Medical Association now publishes nine special journals, including the ARCHIVES OF SURGERY, ARCHIVES OF INTERNAL MEDICINE, ARCHIVES OF OPHTHALMOLOGY, ARCHIVES OF OTOLARYNGOLOGY, ARCHIVES OF DERMATOLOGY AND SYPHILOLOGY, ARCHIVES OF NEUROLOGY AND PSYCHIATRY, ARCHIVES OF PATHOLOGY, AMERICAN JOURNAL OF DISEASES OF CHILDREN and OCCUPATIONAL MEDICINE. At the end of the war it seemed desirable to discontinue publication of WAR MEDICINE and to substitute for it a new periodical OCCUPATIONAL MEDICINE. WAR MEDICINE had a tremendous success not only in circulation and influence but also financially.

The exigencies of the war placed a tremendous burden on the presses of the American Medical Association, which was reflected particularly in the publication of the special journals. It became necessary to reduce the number of pages, to change the editorial format and to eliminate supplements and special editions. A strike in the printing department late in 1945 resulted in considerable delay in the issuance of some of the numbers of the special journals so that it became necessary to combine two issues into a single issue at the end of the year.

All the special journals increased in circulation to a considerable extent with the exception of the ARCHIVES OF SURGERY, which suffered a minute loss, and, very naturally, WAR MEDICINE. Net income from the nine special journals in 1945 amounted to $118,448.46, exceeding the 1944 net income by the sum of $10,486.09.

## Hygeia

The success of HYGEIA as a periodical for the health education of the public has now been fully established. When this periodical was launched more than twenty years ago, some physicians expressed doubt as to its desirability. Today the value of health education is unquestioned and many agencies are participating in the effort to inform people properly regarding health and disease. HYGEIA prints authentic health information and gives it in clear, concise and simple terms that even a school child can understand. It supplies reliable information regarding quacks, faddists and cultists, thus safeguarding the public against exploitation. This leads to the formation of intelligent health habits.

TABLE 2.—*Percentage of Physicians Receiving the Journal**

| State | Number Receiving Journal | Physicians in A. M. A. Directory | Approximate Percentage Receiving Journal |
|---|---|---|---|
| Alabama | 923 | 2,123 | 43 |
| Arizona | 400 | 615 | 65 |
| Arkansas | 626 | 1,806 | 35 |
| California | 9 3[illegible]6 | 12,365 | 76 |
| Colorado | 9[illegible]6 | 1,896 | 51 |

| Rhode Island | 514 | 9[illegible]8 | 54 |
| South Carolina | 6[illegible]2 | 1 427 | 46 |
| South Dakota | 201 | 403 | 50 |
| Tennessee | 1,335 | 2 961 | 45 |
| Texas | [illegible],80[illegible] | 6,9[illegible]2 | 48 |
| Utah | 403 | 58[illegible] | 69 |
| Vermont | 276 | 5[illegible]1 | 50 |
| Virginia | 1 792 | 2,920 | 61 |
| Washington | 1,367 | 2 234 | 61 |
| West Virginia | 847 | 1,834 | 46 |
| Wisconsin | 1 946 | 3 5[illegible]1 | 55 |
| Wyoming | 13[illegible] | 263 | 51 |

* This table gives the number of physicians (based on the 17th Edition of the American Medical Directory) in the United States, the number receiving The Journal and the approximate percentage in each state. Copies to physicians in the United States Army, Navy and Public Health Service are not included.

In addition HYGEIA has proved to be the voice of the medical profession to the public in emphasizing the point of view of American medicine on questions related to social and economic problems. Since 1940 HYGEIA has published more than twenty-five articles on the subject of federalized medicine and legislation introduced to change the nature of medical practice. The

total circulation of the issues in which these articles appeared exceeded 3,000,000 copies

Today HYGEIA is probably the most quoted periodical in the United States Following the appearance of each monthly issue from twenty to thirty requests are received for the privilege of republishing articles from HYGEIA in other publications Hardly an issue of the popular digest magazines appears—including particularly *Scientific Digest, Magazine Digest, Fact Digest, Read, Reader's Scope, This Month* and the *Woman*—that does not contain a reprint from HYGEIA

During 1945 HYGEIA published 147 articles stressing doctor-patient cooperation and education The following titles are indicative "Doctors Guard Your Health," "You Cannot Doctor Yourself," "Can Chiropractic Cure?" "Choosing a Doctor," "Be a Good Patient," "An Appreciation of Doctors," 'Country Doctor' and "Appointment with the Doctor" HYGEIA is carefully edited to avoid any suggestion that it replaces the services of a physician It enlightens people regarding the need of early diagnosis and treatment, the value of periodic health examination and the dangers of quackery and self medication All advertising in HYGEIA is subject to the same rules and regulations that apply in THE JOURNAL.

During 1945 an average of 15,000 physicians made HYGEIA available to patients in their reception rooms Estimates indicate that more than 1 500 000 people thus have access to HYGEIA each month If far more physicians extended this service to the public, the influence of HYGEIA would be greatly enhanced and corresponding good would result to the advancement of medicine. Several physicians give from eight to a dozen subscriptions to HYGEIA to their patients each year

The Woman's Auxiliary to the American Medical Association has been of great help to HYGEIA In 1945 they sent a total of 11,383 subscriptions For this cooperation the medical profession owes appreciation to the Auxiliary

The net paid circulation on Dec. 31, 1945 was 143,105 subscribers as compared with 135,685 at the end of 1944 The average net paid circulation was 128,680 in 1945, as compared with 118,830 in 1944 The financial statement shows a gain of $108,214.21, compared with $68,117 81 for 1944 and $52,758.79 for 1943 Since it was established in 1923, HYGEIA has shown a total gain over the years of $388,851 58, compared with total losses in the various years of $258,984 48 The periodical is thus well on the profit side financially and has also rendered a tremendous service to medical public relations

## Library

In 1945 about 1,800 requests were received in the Association's Library for package libraries, and 1 784 were prepared and lent to members and subscribers The subjects most frequently requested were anesthesia, heart disease, peptic ulcer, syphilis, penicillin, undulant fever and Rh factor Various types of reference questions were also answered by the Library staff compliance with which involved the preparation of recommended lists of books the compilation of short bibliographies of recent literature on a multitude of subjects and the location of vast numbers of articles appearing in past issues of THE JOURNAL. Approximately 4,800 requests for assistance in this type of reference work were received and were answered by letter and telephone. It is also the responsibility of the Library to assist members of the headquarters staff, and much work of this type was done during the year All this work during 1945 was accomplished with a reduced personnel Because of the national scope of the work of the American Medical Association the majority of requests for service from the Library are answered through correspondence. In 1945, however, there were 507 visitors to the Library

Through the periodical lending service 9 946 periodicals were lent. It is interesting to note the increased frequency of requests for this service from Chicago libraries whose holdings greatly exceed those of the American Medical Association Library For example, 453 periodicals were lent to staff members of the University of Chicago, 555 to the American College of Surgeons, 146 to Northwestern University Medical School, 218 to the John Crerar Library and 61 to the University of Illinois Medical School This demand indicates clearly the value of this unusual type of library service.

Three separate volume indexes to THE JOURNAL were, as usual, prepared in the Library

## Quarterly Cumulative Index Medicus

The publication of the QUARTERLY CUMULATIVE INDEX MEDICUS fell far behind schedule in 1945 Much of the delay was due to the printers' strike which occurred in October and much to unavoidable delay in binding Only two issues were published, the January-March 1945 paper issue, which was distributed Aug 6, and the January-June 1945 bound volume, which was not ready for mailing until Feb 2, 1946 A prompt return to the usual schedule of publication cannot be expected in view of present difficulties, there is still an acute shortage of trained personnel for the editorial work and an overloaded printing department

Many foreign periodicals covering the year 1942 were received in November 1945 They had been ordered in March 1942 through the Joint Committee on Importations of the American Library Association The titles received were primarily periodicals published in France Germany and Italy There are still many gaps to be filled for the period from 1940 to date It is hoped that it will be possible to index the missing issues gradually by borrowing them from other libraries About 120 periodicals were removed from the "List of Journals Indexed" because no issues had been received for four or five years If it is possible to borrow or purchase back or current issues of any of the titles dropped, they will, of course, be reinstated in the list The covering of the foreign literature for the war years will, of necessity, be a gradual process The 1945 and 1946 issues of a few foreign periodicals are gradually being received, and approximately 130 foreign exchanges have been reestablished during the past few months. In the January-June 1945 issue of the QUARTERLY CUMULATIVE INDEX MEDICUS 7,617 foreign articles were indexed. In the July-December 1945 issue 7,612 articles were indexed, making a total of 15,229 foreign language articles indexed for the year This figure is slightly under the total for 1944 About 63 per cent of the foreign articles in 1944 represented Spanish and Portuguese material In 1945 the percentage of Spanish literature dropped to 56 5

The net loss sustained in the publication of the Quarterly Cumulative Index Medicus in 1945 amounted to $16,722 08 as compared with a loss in the preceding year of $9,131 89

## Cooperative Medical Advertising Bureau

The Cooperative Medical Advertising Bureau, established thirty-one years ago was entirely reorganized in 1945 and had its most successful year Net gain over 1944 in the earnings of the Bureau amounted to $19,288 51 The volume of advertising obtained for the thirty-five journals of constituent medical associations which continue to be served by the Bureau was considerably larger, and commissions returned to the member journals amounted to $77,800, exceeding the amount returned in the preceding year by the sum of $31,800

Several meetings of the Advisory Committee to the Bureau were held during the year and resulted in the setting up of revised operative principles for the conduct of the Bureau The Council on Pharmacy and Chemistry of the Association, the Secretary of which is an ex officio member of the Advisory Committee, has revised some of its rules with respect to advertising of products considered by the Council The Director of the Bureau resigned his position in late December, and the Board of Trustees appointed as his successor Mr A J Jackson, for many years employed in the Association s Advertising Department. The Bureau staff has been enlarged, and innovations and needed changes have been made in Bureau procedures In view of these facts, it is anticipated that the Cooperative Medical Advertising Bureau will continue to increase its value to the journals which it represents

### Order and Mailing Department

The Order Department in 1945 handled a total of 51,021 orders for 386,844 individual units. The number of units distributed during the year exceeded by almost 100,000 the number sent in 1944. The greatest demand was for material issued through the Bureau of Health Education and the Council on Medical Education and Hospitals. In handling the orders nearly 4 000 mail bags were used having a total weight of more than 120 tons.

The total number of pieces of mail handled through the Mailing Department in 1945 was 1 384,595 including 590,468 pieces of first class metered mail, 27,521 pieces of air, foreign and overweight first class mail and 766,606 pieces of third class mail. Several thousand additional pieces of first class mail were sent out by various departments in the Association's offices without passing through the central Mailing Department.

---

### Council on Pharmacy and Chemistry

Since its establishment in 1905 the Council on Pharmacy and Chemistry has been primarily concerned with the evaluation of drugs and their uses and has pointed its activities to gather facts and to disseminate information in this field of therapy. In more recent years the activities have been enlarged, so that the Council has come to be regarded not only as an advisory body for drug therapy but also as a leader in the field of therapeutics, a leader actively interested in promoting improvements and recommending the discontinuance of outmoded practices. During World War II the Council's advisory functions assumed added significance and its work was greatly increased. Even so, it found the time to plan for new fields of exploration and has developed as one project, the Therapeutic Trials Committee. This standing committee of the Council, which is intended to provide a means of adequately investigating new drugs of promise, is now functioning. It is designed to meet a real need in the research field. At the same time the Council and its headquarters office are studying means of further service to the medical profession in the interest of guarding and improving the health of the nation.

The policies and work of the Council can now be said to include the preparation of special treatises, articles and status reports, the preparation of books designed for the practitioner and the medical student, the giving of grants-in aid for therapeutic research, the securing of therapeutic trial of promising new preparations, the encouragement of basic research on fundamental therapeutic problems and, of course, the answering of inquiries from members of the medical and other professions. The Council is best known to many for its annual publication New and Nonofficial Remedies, which contains statements on standards, tests, actions, uses and dosage of drugs and of other articles which the Council believes should be included for the information of the medical profession.

#### REVISED RULES

In keeping with its expanding endeavors the Council has revised its rules for "acceptance," which eventually will mean the admission of more drugs to New and Nonofficial Remedies. The Federal Food, Drug and Cosmetic Act has made into legal requirements conditions which were formerly controlled only by the Council rules. In view of this added protection, the Council feels that it may safely relax or omit certain rules which have become more of a hindrance than a help in its endeavor to provide informed guidance in the use of drugs. As a result of revision there are now seven basic principles governing Council action (formerly there were eleven). These are available in booklet form, together with explanatory comments and an outline of the form for presentation of articles and may be obtained from the office of the Secretary of the Council at American Medical Association headquarters.

#### MEETINGS

The Council held two meetings in 1945. The topics discussed included the promiscuous use of vitamins and the need for further studies on vitamin therapy, the consideration of cosmetic creams containing estrogens, the external use of sulfonamide preparations, the spread of infectious hepatitis by contaminated syringes and needles, acceptance of drugs for manufacturing use, the cooperative report on thiouracil, the Therapeutic Trials Committee, furtherance of the use of the metric system and revision of the Council's rules.

#### PUBLICATIONS AND REPORTS

During the year over 30,000 copies of New and Nonofficial Remedies, Useful Drugs, the Epitome of the U. S. Pharmacopeia and National Formulary, Annual Reprint of the Reports of the Council, and Glandular Physiology and Therapy were distributed. Of this number New and Nonofficial Remedies comprised over 17,000 copies. One indication of the increasing popularity of this book is the frequency with which copies are requested for review purposes. The 1946 volume of New and Nonofficial Remedies is now being printed. Under the twenty-three general classes of preparations contained in the 1945 volume, approximately 1,000 brands of medicinal agents (exclusive of dosage forms and modifications) were listed and described. This number, of course, varies from year to year.

The Council also adopted for publication various reports concerning the use of drugs in the prevention and treatment of disease. Deserving special mention are reports on Dangers from the External Use of Sulfonamides, Dermatophytosis Treatment and Prophylaxis, Dysentery Bacteriophage, Status of Cosmetics Containing Hormones, The Status of Passive Immunization and Treatment in Pertussis, Status of Poison Ivy Extracts. Many of the articles were requested in reprint form a service available to physicians and to other interested scientists or organizations. These statements have been widely quoted and have been the basis of many references in periodicals and elsewhere.

#### RESEARCH

In addition to organizing the work of the Therapeutic Trials Committee and to initiating and sponsoring research resulting from certain phases of problems facing the Council in its considerations, the Council's Committee on Therapeutic Research issued twenty-two grants ranging from $100 to $3,000. Many articles have been published during the year as a result of work done under these grants.

#### MEMBERSHIP

During 1945 Drs. Fishbein, Long, McCoy and Nelson were reelected to membership on the Council and Dr. Isaac Starr was elected to fill the vacancy created by the resignation of Dr. Eugene M. Landis.

#### PROFESSIONAL RELATIONS

The Council continued to enjoy cooperative relationship with many agencies of the federal government and with other bodies, and it supplied information and other assistance whenever possible. It encourages professional relations with agencies associations and societies to promote helpful understanding of problems of mutual interest. An example of the Council's wide interest and its desire to be helpful is its cooperation with the Office of War Information in the preparation of a booklet on the Control of Communicable Diseases a manual to be distributed for use in occupied countries. The Council provided assistance by appointing a committee to supply statements on treatment of the various diseases mentioned in the manual.

The Secretary of the Council attended a conference called under the auspices of the American Pharmaceutical Association to permit discussion of the sale of barbituric acid compounds and the steps that may be taken to effect control over this sale. It is apparent that the enforcement permissible under the present state laws and the Federal Food, Drug and Cosmetic Act is not preventing abuse of the barbiturates. There was representation at the conference from many interested organizations and the consensus seemed to be in favor of enforcing control at the state level, probably by means of a uniform state law and adequate personnel. It would seem desirable for the House of Delegates of the American Medical Association to reiterate the stand which it took at the annual meeting in 1941.

The Council and its office continued to be of assistance to other Council offices, bureaus and departments at American Medical Association headquarters and to work cooperatively on

projects of mutual interest For example, it considered with the Council on Industrial Health the status of the use of aluminum compounds in the modification and treatment of silicosis, for the Bureau of Health Education it provided information for replies to lay inquirers and assisted in the preparation of a number of radio programs Such cooperation was given the editorial department, the business department, the Council on Medical Education and Hospitals, the Council on Foods and Nutrition, the Council on Physical Medicine, the Bureau of Investigation, the Bureau of Legal Medicine and Legislation, the Council on Medical Service and Public Relations, and other offices

The Council also provided assistance for all medical and other journals interested in following Council policies particularly the state medical journals It has been especially interested in the problems of the state medical journals and societies and is working closely with the Cooperative Medical Advertising Bureau The Secretary of the Council is ex officio a member of the Advisory Committee to the Cooperative Medical Advertising Bureau

OTHER ACTIVITIES

Other efforts to extend the usefulness of the Council and its office include the filing of data on patents for treatment measures, so that all possible approaches to drug therapy which have been studied will be available at the Council office, the collection of data on reactions to and deaths from drugs so that a repository of such information may be established, and the abstracting and filing of federal and state laws on research, the sale and distribution of drugs, and other problems of a similar nature When pooled with the data now available at the Council office and the data accumulated under the auspices of the Therapeutic Trials Committee, this information should make the Council an outstanding source of information on the prevention, diagnosis and treatment of disease. The Council is even expanding its consideration of agents for inclusion in New and Nonofficial Remedies to include such products as insecticides, scabieticides and cosmetic preparations creating a physiologic change in the body All of this information will be freely available as fast as it can be released Only lack of personnel created by the exigencies of war has prevented more rapid expansion of Council activities

Inquiries directed to the Council office are encouraged and during 1945 there was much correspondence concerning drugs used in this country and in other countries The Council's file on foreign drugs especially those sold in Latin American countries is rapidly increasing

The Secretary addressed a number of scientific and nonscientifically trained audiences on varied subjects He and his medical assistants in the Council office will continue to be available when invited and, furthermore, will be available with exhibits for scientific meetings The Secretary also attended a number of meetings to represent the Council and present its views and information, and he worked particularly closely with the U S Pharmacopeia and National Formulary committees

During 1945 a new step in cooperation was undertaken by the Food and Drug Administration, the Council and several representatives of the drug and pharmaceutical industry Before thiouracil a new drug for the treatment of hyperthyroidism was released in interstate commerce, six manufacturers interested in this compound and the Food and Drug Administration prepared a survey by questionnaire of the toxicity of the drug The study, which involved the results of use in 5,745 cases was reported to the Council with a view to informing this body and through it the medical profession. The study was published in THE JOURNAL as a report to the Council and then was given wide distribution by reprint and by reproduction in a journal published by the American Pharmaceutical Association Such cooperation is to be commended, and manufacturers are urged to show a similar spirit in other therapeutic problems of common interest.

Representatives of the Council met with representatives of the Food and Drug Administration the United States Pharmacopeia and the National Formulary to discuss ways and means of expediting the exclusive use of the metric system. Following consultation, several proposals were adopted which will encourage and hasten more extensive use of this system by industry, the medical and pharmaceutical professions and other groups

Announcements of acceptance of new drugs by the Council are now being carried also in the Practical Pharmacy Edition of the *Journal of the American Pharmaceutical Association*, the *American Professional Pharmacist* and the *Journal of the National Association of Retail Druggists* All published Council statements are being circulated to all state medical journals for reproduction if they see fit

## The Chemical Laboratory

The American Medical Association Chemical Laboratory entered the thirty-ninth year of its work with an increased number of new medicinal products before it for examination The types of compounds examined and the problems encountered made necessary a considerable amount of investigative work In addition, a wide variety of substances and dosage forms were considered during 1945 More and more products are being submitted for consideration to the Council on Pharmacy and Chemistry as a direct result of its expanded activities during the war, and the activities of the Chemical Laboratory have been devoted almost exclusively to work requested by the Council

The Laboratory, however, found it possible to cooperate in an original study of the elimination of carbon monoxide from the blood of dogs surviving critical carbon monoxide anoxia This investigation was undertaken as a part of the broad problem of resuscitation being studied under the auspices of the Council on Physical Medicine.

WORK FOR THE COUNCIL ON PHARMACY AND CHEMISTRY

The investigation of new products submitted to the Chemical Laboratory is necessarily of two types First, examinations are made to determine whether or not the products are of the identity and composition claimed, many such investigations going beyond what would be required merely for the elaboration of standards for the drugs, secondly, suitable tests and standards must be prepared for publication in New and Nonofficial Remedies if the products are found to be satisfactory from a chemical point of view and otherwise meet the scrutiny of the Council on Pharmacy and Chemistry These standards are elaborated from original data and from information supplied by manufacturers, with a view to ensuring that marketed products are as pure as possible without undue hardship on the manufacturer The highest standards for medicinal products consistent with proper practical manufacturing technics provide attainment of the ultimate aim—the protection of the sick.

During 1945 the Laboratory aided in the elaboration of tests and standards for products such as diethylstilbestrol dipropionate, a synthetic estrogen, mercuhydrin and mercuhydrin sodium solution a new synthetic mercurial diuretic naphuride sodium, synthetic trypanosomicide, succinchlorimide employed in sterilization of drinking water, testosterone propionate, new synthetic androgen, thrombin topical, employed to control bleeding, pravine hydrochloride, tuamine and tuamine sulfate and vonedrine—examples of new synthetic vasoconstrictors The Laboratory also gave consideration to tests and standards for digitoxin, digoxin ethinyl estradiol, heparin sodium, natural estrogens and protein hydrolysates

The Laboratory continued to assist the Council in connection with the preparation of a number of monographs and descriptions of dosage forms of various drugs published in THE JOURNAL during the year Some assistance was provided in connection with the revision of New and Nonofficial Remedies, 1945, and in replying to correspondence and questions on chemical subjects

WORK FOR OTHER DEPARTMENTS OF THE ASSOCIATION

The Laboratory was of assistance to the Bureau of Investigation, the Library staff, the Editorial Department, the Advertising Committee and other departments through technical advice and a limited amount of chemical examination

Members of the Laboratory staff have attended a number of scientific and technical conferences during the year

## Council on Physical Medicine

The year 1945 marked the twentieth anniversary of the standing committee of the Board of Trustees known as the Council on Physical Medicine. Its name was changed in 1944 from the Council on Physical Therapy to the Council on Physical Medicine. Physical therapy was in a chaotic state at the time the Council was organized twenty years ago. Its membership was made up of specialists in important fields of medicine who were interested in the advancement of physical therapy. A period of self education was required. The Council sponsored special scientific studies in fields in which little was known at that time. Eventually, by diligent study and scientific research the truth began to emerge out of the confusion of countless claims and counterclaims for the efficacy of physical medicine.

The change in name of the Council was considered advisable because its scope had been broadened and its responsibilities increased. Although physical agents coming under its purview had included diagnostic and therapeutic appliances, greater stress was attached to them, and occupational therapy and rehabilitation were added to the agenda of the Council.

There are many mechanical contrivances which are used in one way or another in the practice of medicine. In view of the large number, the Council voted to limit its consideration to products the physical properties of which are applied directly to the human being as, for example, autoclaves and ultraviolet lamps which are used for sterilization purposes. The autoclave is used to sterilize instruments, bandages and other material employed by a physician in the practice of medicine, but the autoclave itself is not directly applied to a patient. Ultraviolet lamps on the other hand, produce radiation which has a limited usefulness as a disinfectant but which also has an effect on the skin of human beings that might cause serious burns.

As a result of the restrictions placed on raw materials during the war, it was understandable that new equipment for the trade was not developed. At the conclusion of World War II, several pieces of apparatus were submitted for consideration, but the reconversion lag and the labor unrest have curtailed the manufacture of new equipment. During the year the Council considered thirty-one pieces of apparatus and published notices of acceptance of fourteen and of rejections of two pieces.

### PUBLICATIONS

The booklet Apparatus Accepted was revised and is now available. Approximately 10,000 copies have been distributed among the members of the senior and junior classes at seventy-eight approved medical schools. The Council is grateful for the willingness of the deans of medical schools to distribute Apparatus Accepted among the students. In the future the Council will provide copies of the booklet for students in the junior classes at the medical schools, since physical medicine is usually taught in the third year. The Manual of Occupational Therapy has been revised and is now ready for printing. The Handbook on Physical Medicine was revised in 1944 and is enjoying wide distribution. It is now in its second printing. Special articles on phases of physical medicine have been published from time to time.

### RESEARCH

The Council on Physical Medicine has supported research on problems of a controversial nature. One such problem is artificial respiration. The "Five Year Survey of Methods for Artificial Respiration" by Bernard D. Ross, M.D., Ph.D., has been completed, and reprints are available. This article is a compilation of case histories of the emergency life saving crews of the U. S. Coast Guard and of fire departments in certain large cities. All methods of artificial respiration in current use were considered in this report. The investigation of methods of artificial respiration is going forward satisfactorily in the Department of Physiology of Northwestern University School of Medicine. One article has been published entitled "Safety of Modern Alternating Positive and Negative Pressure Resuscitators," by Henry Schwerma, Ph.D. and A. C. Ivy, Ph.D., M.D. Reprints of this article are available. The results of this investigation confirm a previous decision reached by the Council with reference to problems involving artificial respiration. The studies are being continued, and it is believed that new information will be forthcoming bearing on this important field.

### PHYSIATRIST

A physician specializing in and practicing physical medicine has been in the unenviable position of not having a term to designate his specialty. There has been a general acceptance of "physical medicine," which is now regarded as including the broad fields of physical therapy and occupational therapy. The Council has gone on record as favoring the term "physiatrist" to designate a physician specializing in physical medicine. The Council believes that this term is etymologically correct and is of pure Greek origin. It is derived from the two Greek words "physis" and "iatreia." "Physis" pertains to the physical or natural phenomena, and the terms "physicist" and "physiologist" derive their first syllable from the same origin. "Iatreia" refers to healing or to the healer. Since the physician is a healer, a "physiatrist" would be a physician who employs physical agents for the treatment of disease.

### RADIUM AND RADIUM PRODUCTS

Radium and radium products are important agents in physical medicine. Several years ago the Council launched an investigation of radon and radon products. As the result of recent inquiries regarding the rental of radium and the selling of radon, the Council is going forward more energetically with the consideration of these methods of treatment and has assigned to its Consultants on Roentgen Ray Therapy, now called Consultants on Roentgen Rays and Radium, the additional duty of advising the Council relative to therapeutic and reputable methods of distribution of radium and radium products.

### COUNCIL CONSULTANTS

In view of the diversified field of physical medicine, the Council has from time to time appointed various groups of specialists to aid in solving the problems and now has Consultants on Artificial Limbs, Audiometers and Hearing Aids, Contraceptive Devices, Education, Electrocardiographs, Electroencephalographs, Occupational Therapy, Ophthalmic Devices, Respirators and Roentgen Rays and Radium.

### AUDIOMETERS AND HEARING AIDS

The development of the miniature vacuum tube, which is being made smaller and smaller and consuming less energy, has led the way to the development of the modern vacuum tube hearing aid. With the help of its Consultants on Audiometers and Hearing Aids the Council has prosecuted its examination of audiometers and hearing aids and has published reports on them. The Council on Physical Medicine greatly appreciates the cooperation and advice it receives from the American Academy of Ophthalmology and Otolaryngology, the American Otological Society, the American Laryngological, Rhinological and Otological Society and the American Society for the Hard of Hearing and its several chapters.

### OPHTHALMIC DEVICES

The Consultants on Ophthalmic Devices, who are also members of the American Committee on Optics and Visual Physiology, have given valuable assistance to the Council in the investigation of charts for testing vision and muscle balance, instruments for orthoptic training and other devices utilized in the ophthalmic field.

### DIATHERMY APPARATUS

During World War II the Federal Communications Commission reviewed the assignments of frequency channels for various radio services. The improvement in radio transmission in the higher frequencies presented a problem which required careful study. When the short wave diathermy apparatus first came on the market some ten years ago there were few radio services in the frequency bands corresponding to the high frequency energy emitted by diathermy equipment which was not absorbed by the tissues undergoing treatment. At the present time there are various short wave diathermy machines being used for certain types of communications which extend

far beyond the regional use of diathermy in the radio spectrum The Council on Physical Medicine has cooperated with the Federal Communications Commission in an effort to solve this problem The commission has carefully surveyed the field in which high frequency electrical energy is used and has recommended three channels for medical and industrial heating applications The final decision has been handed down by the commission, but agreement has not been reached on the exact type of equipment which will meet the requirements The Council on Physical Medicine is now revising its minimum requirements for acceptance of diathermy apparatus in view of the rulings of the commission

EDUCATION

The Council gave consideration to the establishment of a section on physical medicine in the Scientific Assembly of the American Medical Association The Council welcomes and regards as a move in the right direction the new special journal OCCUPATIONAL MEDICINE. Its editorial board was so selected that representation of physical medicine and occupational therapy was included. The activities of the Baruch Committee on Physical Medicine and of the National Foundation for Infantile Paralysis in the field of physical medicine have been enthusiastically acclaimed by the Council and acknowledged as spearheads in the advancement of true physical medicine.

## Council on Foods and Nutrition

The Council on Foods and Nutrition, which was created in 1929, is now entering its seventeenth year of service as an integral part of the American Medical Association This body of twelve experts in the field of nutrition has had an important role in shaping progressive policies in food and allied industries and in encouraging the use of sound, nutritive diets While its leadership was apparent during the war years, it was especially emphasized in 1945 as attention was given to improving the quality of foods and to disseminating information on the value of obtaining the best possible quality for the maintenance of a healthy nation Its increased attention to special foods, frequently referred to as special purpose foods, has elicited many commendations The Council plans to pursue this objective even more energetically during 1946

COOPERATION

The Council continued during 1945 to make its services available to individuals and groups interested in foods and nutrition Harmonious relationship existed with agencies of the government and with other organizations, a relationship that has been in existence for years and is constantly encouraged by all participating groups The Council also worked closely with the other departments of the Association headquarters in problems of mutual interest, of which there are many during the course of the year Plans are being made to extend this cooperation

PUBLICATIONS AND COUNCIL REPORTS

During 1945 there were sold over 1,000 copies of the Handbook of Nutrition, and almost 2,000 copies of the Council's food chart were distributed Both publications have been widely acclaimed

A series of nine articles discussing the significance of protein nutrition in health and disease was printed under the Council auspices in THE JOURNAL. This series received wide acclaim and was subsequently made available in booklet form by two industrial organizations, one organization alone printing in English 250 000 copies and in Spanish 25,000 copies The series included discussions on the role of protein in human nutrition, the importance of protein in pregnancy, protein nutrition in problems of medical interest, protein in surgery, protein nutrition in pediatrics, proteins and resistance to infection clinical detection of protein deficiencies selection of protein-containing foods to meet protein requirements, and the practical use of amino acids in human nutrition

Included in other reports published by or under the auspices of the Council were discussions on the restoration, enrichment and fortification of food, with special emphasis on processed cereals, corn meal, hulled rice, white flour, white bread and rolls, farina, milk, oleomargarine and salt, the preventive and therapeutic use of vitamins, the effect of cocoa on the utilization of dietary calcium, iodized salt for the prophylaxis of endemic goiter, and the addition of synthetic vitamins to confectionery All these subjects play an important part in our everyday life, and the Council has made worth while and revealing contributions by preparing or sponsoring reports which will clear away confusion and encourage rational dietary habits

COUNCIL MEETINGS

Only one meeting was held during the year at which time Dr James S McLester and Dr Howard B Lewis were reelected chairman and vice chairman respectively Among the subjects discussed were tomato and citrus juices containing comparatively large amounts of vitamin C, the value of placing reliance on the proper selection of natural foods for good nutrition instead of on fortified foods, permissible claims for vitamin D and the need for establishing a reasonable standard of quality for white bread and rolls including minimum levels for thiamine, riboflavin, niacin and iron

In connection with the latter problem the Council discussed the progress which is being made in the matter of state enactment of laws which may lead toward the goal of universal requirements for enrichment of white bread and rolls and concluded that it seems apparent that considerable time may elapse before a majority of states will have laws requiring enrichment Thus some other means of accomplishing this objective should be sought. It was pointed out that under the Food, Drug and Cosmetic Act there is provision for setting standards of quality on certain types of foods Application of such a principle to white bread and rolls would provide a standard by which the quality of this food material could be readily determined. With this purpose in view, the Council adopted a resolution urging that the administrator of the Federal Security Agency hold a hearing at the earliest practicable date under the provisions of the Food, Drug and Cosmetic Act for the purpose of considering a proposal to fix and establish a reasonable standard of quality for white bread and rolls including provisions for minimum levels for thiamine, riboflavin, niacin and iron

The Council decided that, in addition to being prepared and marketed as a special purpose food, an article must also serve a nutritionally valuable or significant purpose in order to be placed in the accepted list of foods, that infant food preparations with an unnecessary multiplicity of ingredients cannot be looked on with favor, and that the Council seal cannot be provided for articles manufactured and sold for use exclusively in foreign countries

MEMBERSHIP

Dr A A Weech of the Children's Hospital Research Foundation, Cincinnati, was elected to membership on the Council to fill the vacancy created by the expiration of the term of Dr Irvine McQuarrie, who had served for a period of six years

ASSISTANCE TO MEDICAL PROFESSION

In addition to its normal activities, the Council provides answers to inquiries on food and nutrition problems Many of the questions come from the medical profession, and the Council office sincerely hopes that its facilities will be increasingly used by physicians and others No stone will be left unturned to gather information for those who seek it. Evidence of the recognition given to this assistance is the frequency with which persons visit the Council office.

NEW ACTIVITIES

Several projects are now in the process of development to further the usefulness of the Council As the groundwork is completed, the details of operation will be made known by publication in THE JOURNAL, by amendment to the explanatory comments accompanying the Council rules or by other methods Primarily the projects are intended to aid the medical profession in its constant search for information. In turn, the general population will be benefited by these and other activities that will be undertaken by the Council

## Council on Industrial Health

The immediate postwar months have been characterized by considerable reductions in the health and safety programs of the Army, Navy and U. S. Maritime Commission, and in the great armament centers owned by the government and operated under private auspices. There have been inevitable readjustments with respect to private industry during conversion from war to peace, but, on the whole, interest in medical supervision over workers and over working environment continues at a high level.

### PUBLIC RELATIONS

The status of industrial health in the current planning for an international health body in the United Nations organization has been of considerable interest to the Council on Industrial Health. The proposals are all in the planning stage, but it has been learned that the important field of industrial hygiene will occupy a prominent place, that technical committees will be created to govern these matters and that these committees will undoubtedly be mixed or joint in nature, including in them representation from the International Labor Office and other interested bodies as well as representatives from international and national official and private organizations having legitimate interests in this field.

In keeping with the recommendation of the House of Delegates at its 1945 meeting, the Council has set in motion certain inquiries regarding its part in promoting cultural and scientific relations with Canada and Latin America in matters dealing with industrial health and welfare.

The Council's relations with governmental agencies in this country have shifted from those responsible for the conduct of the war to those mainly concerned with conversion to private civilian enterprise. Of these, the most important are the Division of Industrial Hygiene of the U. S. Public Health Service, the Bureaus of Labor Standards and Labor Statistics in the U. S. Department of Labor, the U. S. Civil Service Commission, the Veterans Administration and the Office of Vocational Rehabilitation in the Federal Security Agency. The Council is still impressed with the necessity for improving its relations with influential leaders in the labor and management fields. Medicine has a great opportunity to contribute to improved human relations in industry, and certainly there are great areas of agreement on the values of industrial health services. The possibility of national and state industrial health conference boards is under discussion in the hope that such agencies may do much to overcome resistance to occupational health service and to promote the ultimate objectives in this field. An additional factor tending toward greater public acceptance is health education for industrial workers, which the Council actively advocates but in which both labor and management must intimately participate. There is no great advantage in setting up ideal health conditions in the working environment when such influences can be dissipated by unhealthful living conditions, poor nutrition, poor use of leisure time and other factors encountered by the working population outside of employment.

There is value in some form of registration of industrial medical services in order to have a clear idea of how extensive these services are, the nature of physician participation therein and how well they conform to accepted standards. This activity will be pursued as soon as sufficient help is available.

### PROFESSIONAL RELATIONS

Variations in interest and activity expressed by the committees on industrial health in the state and county medical societies are still very large. Resumption of field services by the Council is expected to improve this situation measurably. The duties of these committees and the best methods of organizing for better industrial health at state and local levels will be reviewed in the light of new and changing relations—especially demands made in employment contracts and in the proposed wide extension of industrial hygiene activities in industrial hygiene divisions of state governmental agencies. The committees on industrial health in the special sections of the Scientific Assembly of the American Medical Association are great potential contributors to improved care of occupational disabilities. Several exceptionally meritorious investigations are now under way. Other professional groups such as dentists, nurses, nutritionists, engineers and chemists are active in the field, and appropriate matters are discussed with them from time to time.

A gratifying amount of interest has been expressed by returning medical officers in opportunities in occupational medicine. In order to facilitate such placement, the Council has recommended that an attempt should be made to fill vacancies locally if possible. If local facilities are not available, recourse should be made to the secretary of the state medical society. If neither of these procedures is productive, the office of the Council on Industrial Health is prepared to be as helpful as possible in bringing notice of vacancies and opportunities to the attention of physicians. The Council has been asked to express its opinion about the ethical and organizational relationships in setting up services of this kind in both large and small industries. The "Outline of Procedure for Physicians in Industry," prepared by the Council on Industrial Health and approved by the Judicial Council, needs some further interpretation in these directions. Illustrating this point, the Committee on Industrial Health of the Medical Society of the City of New York believes that one of its principal objectives is to clarify the relationships which ought to exist between industrial and private practitioners.

### SCIENTIFIC DEVELOPMENTS

Education in the field of industrial health was reviewed by representatives of the Council, the American Association of Industrial Physicians and Surgeons and the American Public Health Association, all of whom are interested in advancing the standards of medical accomplishment in this field. There has been no change in the directions of major attack on the educational problem—orientation courses to undergraduates, wide availability of introductory and refresher courses to physicians in community practice and implementation of a certification program at the earliest possible opportunity. The Council has noted with satisfaction that a number of medical and professional schools are actively interested in establishing institutes or divisions of industrial health. These centers will not only provide specialty training but will promote improved teaching of the subject throughout the whole field of medical education.

The Council on Industrial Health has been greatly concerned over medical participation in research and investigative phases of environmental hygiene as well as standards of supervision over individual workers themselves. As the situation now stands, the field of industrial hygiene is almost entirely preempted by nonmedical people—sanitary engineers, chemists and toxicologists. Here again is an example of the urgent necessity for diverting medical brains to useful fields of investigation which have great potentiality for widespread good and professional advancement. The Council is well aware of this problem and hopes that active support will be forthcoming to improve the general situation.

The program of national and regional conferences in industrial health has been resumed. These are concerned with important problems in the administrative industrial medical relationships, in public health and preventive medical fields and in specific problems in industrial hygiene and toxicology as well as improved standards of traumatic surgery and occupational disease management.

The decision of the Board of Trustees to publish the journal OCCUPATIONAL MEDICINE is regarded by the Council as the outstanding development in advancement toward higher professional standards in recent years.

### INDUSTRIAL HEALTH STANDARDS

The Council has issued reports from time to time covering standards governing the objectives of industrial health, procedures for physicians in industry, the setting up of an industrial medical department, the conducting of plant hygiene surveys, standing orders for industrial nurses and similar reports. All of these are currently under revision. In addition the Council is actively engaged in establishing standards for physical examination in industry, both preplacement and periodic and especially the relationships which should exist between jobs and physical and mental fitness. To this basic physical

examination formula special addenda will be prepared dealing with such matters as the evaluation of the cardiovascular system, the respiratory apparatus, neurologic examinations and appraisals based on mental and emotional makeup All these factors are of increasing importance to sound employee relations in industry and in the growing specialty of vocational counseling Physicians are eminently adapted to conduct these services for industry, and the Council is anxious that this concept be brought to the profession at large at once

It is essential that there be better reporting of occupational morbidity and mortality, without which no clear sense of direction and organization is possible There are reasonably accurate data on the occurrence of industrial accidents, but statistical information in the related fields of occupational disease and of the incidence of ordinary illnesses are very fragmentary and incomplete There is widespread opinion on the part of physicians in industry that greater attention to these details would constitute an important contribution to the whole subject of epidemiology

Health examinations and conservation programs among the management and supervisory groups in industry is a neglected subject. Physical and mental wreckage in these classifications is far greater than ordinarily realized, especially during times of extraordinary responsibility and attention to details Much education based on a real understanding of the elements of the problem is a practical necessity

During the year the Council issued reports on "Mass Health Surveys in Industry" and 'The Effect of Fluorescent Light on Vision." More recently a joint report has been issued with the Council on Pharmacy and Chemistry on "Aluminum in the Prevention and Treatment of Silicosis"

### WORKMEN'S COMPENSATION

The Council has actively fostered the formation of a National Workmen's Compensation Conference Committee to promote discussion of all matters dealing with the administration of workmen s compensation statutes and with medical relations associated therewith Other groups represented on this committee are the International Association of Industrial Accident Boards and Commissions, the Combined Claims Committee of the Stock and Mutual Casualty Insurance Companies, the American Federation of Labor, the Congress of Industrial Organizations, the National Association of Manufacturers, the Chamber of Commerce of the United States and the Bureau of Labor Standards of the U S Department of Labor This committee is regarded, at least by some of the participants, as the most significant development in workmen s compensation affairs since the original enactment of this form of legislation. Medical subjects to be considered deal with improved treatment of compensable disability, proper control over medical testimony, disability evaluation, greater participation in the administration of workmen's compensation by properly trained medical people and greater recognition of the inherent values of rehabilitation as a factor in compensation work

The Council expects to continue its other activities in workmen's compensation which have to do with effective relations in state medical societies, with individual industrial commissions and compensation boards and with insurance groups In this connection it is hoped to be able to accomplish some basic work in the general field of simplification and uniformity of medical records

### REHABILITATION

The Council is of the opinion that rehabilitation is a preeminent medical problem and likely to continue as such for many years to come. Although the policies of many official and unofficial groups in this field are relatively uniform, the Council has attempted to represent the medical point of view in all discussions dealing with this large field. The attitude expressed has been that physical restoration is the fundamental principle in the rehabilitation of the crippled and disabled and that these services can be adequately carried out only under medical direction and supervision. Other aspects of the problem, notably vocational training and placement, are important but must rest fundamentally on the best possible medical reduction of the disability It is felt that the medical profession on the whole is not entirely conversant with the size and urgency of the rehabilitation problem and the Council expects, therefore, to give more and more attention to reviewing this whole field and medicine s place in it, to educating the profession about current trends and methods, to maintaining a clearing house of information, to fostering effective state relations, to maintaining proper contact with official and voluntary agencies and to working closely in this field with other official groups in the American Medical Association, particularly the Council on Physical Medicine.

### COMMITTEE REORGANIZATION

Because of circumstances outlined in this report, the Council undertook to revise its internal organization, which now is to consist of committees dealing with public relations, professional relations, standards, scientific development workmen's compensation and rehabilitation The headquarters staff will be designed to carry forward the work of these committees as effectively as possible.

---

## Bureau of Health Education

Although the war ended on both the European and Asiatic fronts in 1945, the difficulties under which the work of the Bureau of Health Education was carried on were not relieved In some ways they were intensified.

### PERSONNEL

The most important change in Bureau personnel during the year was due to the death of Dr Paul A Teschner, Assistant Director Dr Teschner died on May 25 1945 after eight years and six months' service with the Association. His death was keenly felt because he was not only a competent and conscientious professional worker but also a warm, human personality

After a comprehensive search the Bureau procured the services of a new Assistant Director, Dr William W Bolton, who is well prepared to perform the duties of his position. Dr Bolton began his service with the Association on Oct. 16, 1945

During most of the year the Bureau had one or more vacancies in the stenographic force, but in general there was less turnover than in the preceding year

### CORRESPONDENCE

Correspondence with physicians and cooperating agencies increased from 3,825 to 4 545, question and answer letters from 6,598 to 7 955 Queries from museums and exhibits decreased from 1,259 to 1,129 The total increase was from 11,718 to 13,629

### BUREAU PUBLICATIONS

The Bureau reviewed eleven books for THE JOURNAL and nine for HYGEIA and prepared eighteen other contributions to THE JOURNAL and three to HYGEIA, including editorials, radio announcements and news items

The Bureau originated seventeen articles published in periodicals other than those of the American Medical Association The Director supervised the revision of medical items in the American People s Encyclopedia and miscellaneous items for Britannica Junior Consultation was furnished on an unpublished manuscript for Scott, Foresman and Company and for the Zurich Insurance Companies

### RADIO

The radio work of the Bureau falls into four principal classifications

1 The network program was continued into its twelfth consecutive year of dramatized broadcasts on a nationwide network of the National Broadcasting Company Under the general theme "Doctors at Work" the series title for 1945 was "Doctors Look Ahead." The first broadcast was made on January 6 Twenty-five broadcasts were made, and there was one cancellation, owing to the death of President Roosevelt.

2 The script library again shows a shrinkage both in number of available talks and in local usage. This library now offers 254 fifteen minute and 157 ten minute talks Eight county medical societies and auxiliaries, one state medical association, seven local health departments and eleven miscellaneous agencies used these scripts in 1945, borrowing 1,132 scripts There is no record of how many of these scripts were broadcast.

3 Electrical transcriptions continued to constitute a large proportion of the work of the Bureau in 1945 Starting with an experimental project over radio station WLS and continuing through 1944 the Bureau has continued to make and distribute electrical transcriptions Seeking variety in program structure in order to enhance listener appeal an attempt has been made to diversify the programs so that they now include interviews, round tables, dramatizations and musical programs with brief health hints As of the later months of 1945, distribution accounted for an average of between eighty and ninety local broadcasts weekly well distributed over the United States, with special activity in Arizona, Wisconsin, Texas and Pennsylvania as a result of active cooperation from the medical societies of those states As a general rule from 60 to 65 per cent of the stock of transcriptions is on loan and 35 per cent available for new borrowers This seems to be an adequate margin of reserve. Losses from breakage and failure to return recordings continues to be surprisingly small Loss of shipping containers is greater It is estimated that 2,921 local broadcasts were made from the Bureau s transcriptions in 1945, more than double the 1 052 made in 1944

During 1945 the following transcription series were made

A Guardians of Your Health in which thirty two authorities in public health were interviewed by Harriet Hester Each program was summarized by Dr W W Bauer

B Keep Cool Interviews of Dr W W Bauer by June Merrill, director of women s programs station WJJD

C Why Do You Worry? A dramatized series on mental hygiene under the general supervision of Dr Jules Masserman Department of Psychiatry University of Chicago with thirteen well known psychiatrists contributing the details

D More Life For You! In this series, begun in 1944 and finished and released in 1945 twenty two prominent physicians were interviewed on health problems of middle and advancing age

### MEETINGS AND CONFERENCES

The Director traveled 76 352 miles to attend meetings or address audiences in fourteen states Travel difficulties were greater than ever, with hotel room scarcity added to the difficulty of procuring railroad transportation. Audiences numbered sixty nine totaling 17 185 persons The Director participated in fourteen conferences and committee meetings

### HYGEIA CLIPPING COLLECTIONS

The loan of HYGEIA clipping collections to local physicians addressing lay audiences reached the lowest point since the introduction of this service Only fifty-eight collections were lent, but these went to doctors in twenty-three states The principal topics called for were cancer adult mental hygiene and sex education

### HEALTH PUBLICATIONS

Fourteen new titles were added and seven discontinued Distribution of Bureau publications through the Order Department was 161 580, and the Bureau disposed of 104 480 reprints direct to quantity purchasers, making a total of 266 060 as compared with 217,879 in 1944

### COOPERATIVE RELATIONSHIPS

Joint Committee on Health Problems in Education of the National Education Association and the American Medical Association The 1945 meeting of the joint committee was held for the second successive year at American Medical Association headquarters The committee reelected Dr Thurman B Rice as chairman, Dr Anne Schley Duggan vice chairman and Dr W W Bauer secretary Dr George M Lyon attended the meeting for the first time since entrance in the U S Navy, and Dr Louis R Burnett was a new member representing the National Education Association, otherwise the personnel of the committee remained unchanged

The principal items dealt with by the committee were (1) conservation of hearing in school children, (2) health implications of the physical education program, (3) ration point problems in school lunch projects, (4) comment on the use of tampons as menstrual guards, (5) sanitary requirements for school lunches, (6) principles governing school lunches and (7) health appraisal procedures during shortages of school physicians or nurses

Mimeographed press releases of these items, except the ration point statement, were mailed to one hundred and thirty-five educational journals and medical journals, and there are indications that many have published them either in whole or in part.

U S Children's Bureau Advisory Committee The committee held one meeting in 1945 The proceedings of that meeting were summarized in a report issued by the Children s Bureau and published in brief in THE JOURNAL, Jan 26, 1946. The meeting was not devoted to the normal maternal and child health programs for which the Advisory Committee was appointed or even to the Emergency Maternity and Infancy Care Program but to the pending legislation known as the Pepper bill, which proposes to place under the Children's Bureau a comprehensive program of medical care for all pregnant women and for children up to the age of 21 Significant in this meeting was opposition to administration of this program by the Children s Bureau, entirely aside from medical objections to the program itself Opposed to Children's Bureau administration were a number of representatives of state health departments as well as representatives of the medical profession. The Advisory Committee, however, is so constituted that there is always present a majority of members who can be depended on to support policies of the Children's Bureau At this meeting, for the first time, opportunity was given to include a minority report in the proceedings

National Committee for Boys and Girls Club Work and National Congress of Parents and Teachers There is nothing of special interest to report with relation to these committees

American Public Health Association The annual meeting was canceled, but the committees continued to function The Committee on Professional Education, of which the Director of the Bureau of Health Education is a member, met twice with particular reference to accreditation of schools of public health. The Director submitted the proposals to Dr Victor Johnson, Secretary of the Council on Medical Education and Hospitals and received his guidance and advice

National Conference for Cooperation in School Health Education Committees of this agency were active during the year, producing reports on school health policies, which should prove of great value The conference revised and published the highly successful 'Suggested School Health Policies" report previously sponsored by other agencies This report embodies policies which are acceptable to the profession. A report dealing with the function of school administrators, school physicians and school nurses is in preparation, and its publication in tentative form was authorized The Director attended one meeting of a revision committee for Suggested School Health Policies and one meeting of the conference. The new Assistant Director also attended the latter meeting

U S Government Agencies The Bureau continues to cooperate largely by correspondence, with government agencies Materials or information have been furnished during 1945 to

War Department Army Service Forces Lawson General Hospital Army Medical Library, ASF Library Branch, Edgewood Arsenal Office of the Surgeon General Second Service Command Regional Hospital, Eastern Signal Corps Training Center Office of Secretary of War Civilian Medical Division Army Air Forces Atlantic Overseas Air Technical Service Command Convalescent Hospital Florida
Department of Labor Children s Bureau.
Federal Trade Commission
Federal Security Agency Joint Committee on Physical Fitness U S Office of Education U S Public Health Service
Department of State
Patent Office
War Food Administration Office of Labor
Department of the Interior Office of Indian Affairs War Relocation Authority
Department of Agriculture Food and Drug Administration
Government Printing Office
Office of Inter American Affairs.
Navy Department Naval Hospital Santa Cruz Calif Surgeon General Naval Hospital Philadelphia Bureau of Medicine and Surgery, Office of Naval Officer Procurement
Office of War Information Library Servicing Division Science and Medicine Unit Foreign Information Research Division Bureau of Overseas Publications
War Manpower Commission

### MISCELLANEOUS

Guides trained by the Bureau made many tours of the building with guests

The Bureau continued to compile information about attacks on and defense of medical research and to distribute it in

response to requests A representative was sent to the "school" operated by the antivivisectionists in Philadelphia

The Bureau continued to furnish questions and answers to HYGEIA for publication and to check all galley proofs and page proofs for medical accuracy

The Bureau continued its cooperation with the Woman's Auxiliary

Postgraduate students from the United States Public Health Service were unable to come to the Association because of travel difficulties Instead, the Director spent a day in conference at each of the three principal universities where these students are working, namely the University of North Carolina, Yale University and the University of Michigan

APPRECIATION

Appreciation is expressed to the Board of Trustees, the General Manager, the Editor and the heads of other departments in making possible the work of the Bureau This bureau is a transmitting rather than an originating department and therefore relies heavily on the friendly cooperation of others

## Bureau of Investigation

In December 1945 Dr Paul C Barton, resigned as Director of the Bureau of Investigation after a three year leave of absence when he was connected with the office of the Procurement and Assignment Service in Washington. The Bureau meantime carried on its part of the Association's educational activities by continuing to collect information on "patent medicines" and quackery in general and to distribute such material to the medical profession, government agencies, federal, state and municipal authorities, scientific societies, civic and welfare organizations Better Business Bureaus Red Cross home nursing classes, clubs radio stations, newspapers and magazines, research workers teachers students and the public in general Mr Bliss O Halling assistant in the Bureau of Investigation for many years, was made Acting Director on the resignation of Dr Barton

INQUIRIES

The inquiries from various sources again showed an increase over the previous year Particularly numerous were those coming from Better Business Bureaus federal agencies newspapers, magazines, trade journals, church, lodge and farm publications and especially student nurses and students of high school and college classes who had been assigned projects in consumer problems The latter inquiries gave evidence that the Bureau is increasingly helping the student generation to understand the "patent medicine' situation All these inquirers have sought light on a wide variety of nostrums quacks and medical fads and schemes This information has included statistical data and bibliographies.

The leading Chicago newspapers, as well as general magazines and farm journals elsewhere, have frequently consulted the Bureau regarding the numerous medical advertisements submitted to them and detailed information on these has been furnished

Constant service has been given to the Better Business Bureaus over the country which seek light on the many nostrums and medical schemes that come to their attention

County and state medical societies and health and licensing boards have continued to call on the Bureau for information about its investigations of medical irregularities that constitute problems in their sections These societies, as well as the Better Business Bureaus, also have supplied the Bureau with data valuable in conducting investigations

Though there was a lessening of inquiries during the early years of the war, it is noted that the years 1944 and 1945 showed an increase. The number of letters answered in 1945 was 3,071, representing 4,525 subjects This means that many inquiries included more than one subject, particularly in the case of letters from students, who learn of the Bureau's services through their textbooks

Inquiries about the Kaadt Diabetes Cure, advertised by an 'institute near Fort Wayne, Ind, led the list in 1945 and 1944 whereas it was third in 1943 The general subject of 'patent medicines' again was second in 1945 as in the previous year

THE JOURNAL

In 1945 the Bureau contributed eighteen and one half columns to THE JOURNAL, representing fifteen articles These included presentations of abstracts of thirty six Notices of Judgment issued by the Food and Drug Administration, one Cease and Desist Order from the Federal Trade Commission, and twelve fraud orders from the Post Office Department. The Bureau prepared much more material for THE JOURNAL which has not yet been published

PUBLICATIONS

In 1945, 650 pamphlets issued by the Bureau and 152 copies of the book "Nostrums and Quackery and Pseudo-Medicine' were distributed, both of these figures representing an increase of about 50 per cent over 1944

OTHER SERVICES

The Bureau's lantern slides and film strip dealing with the nostrum evil and quackery were lent to physicians and educators over the country

Considerable discussion time, correspondence and other forms of assistance were given by the Bureau in 1945 to the Post Office Department, the Federal Bureau of Investigation, the Food and Drug Administration and the Federal Trade Commission The Bureau has evidence that its activity in bringing violations of law to the attention of federal agencies has resulted in debarring certain medical schemes from the mails by the Post Office Department, in prosecutions brought by the Food and Drug Administration against violators of the Food, Drug and Cosmetic Act of 1938 and in actions by the Federal Trade Commission against persons and concerns who made unwarranted claims in medical advertising

## Bureau of Legal Medicine and Legislation

Mr George E. Hall Jr, after serving twenty-six months in the military service, has returned to his position with the Bureau

SYMPOSIUM ON MEDICOLEGAL PROBLEMS

In reports for previous years the Bureau has commented on the development of discussions on medicolegal subjects jointly sponsored by physicians and lawyers as affording an excellent medium for the exploration of problems of mutual interest and concern to members of these two professions During the fall of 1945 the Institute of Medicine of Chicago and the Chicago Bar Association jointly arranged a Symposium on Medicolegal Problems consisting of six programs at weekly intervals The meetings were held at the headquarters of the bar association on Tuesday evenings During the course of the meetings the medical and legal aspects of the following subjects were discussed (1) The Medical Witness in Court Expert Testimony (the Chicago Medical Society collaborating) (2) Artificial Insemination Medicolegal Implications (3) The Practice of Pathology and Its Medicolegal Problems (the Chicago Pathological Society collaborating), (4) Operations to Produce Sterility Medicolegal Implications, (5) Trauma and Tumors in Industrial Medicine, and (6) Scientific Tests in Evidence Blood Grouping Tests in Disputed Paternity Cases, Chemical Tests for Intoxication

The Director of the Bureau, who is a member of the Committee on Local Medicolegal Problems of the institute collaborated in arranging these discussions, which were well attended by physicians and lawyers To repeat a comment contained in the report of the Bureau submitted to the House of Delegates in 1944 "Periodic programs of this type, attended by members of the bar and by physicians, will result in a much needed diffusion of information in this important field'

FEDERAL LEGISLATION

The first session of the Seventy-Ninth Congress adjourned Dec 21, 1945 The second session convened on Jan 14, 1946 and is in progress at the time this report is being prepared Since the report submitted to the House of Delegates in December of last year there has been a noticeable increase

in the activities in Congress in relation to proposals of medical interest, and reference to some of these activities follows

*The G I Bill of Rights*—The Servicemen's Readjustment Act of 1944, commonly referred to as the G I Bill of Rights, was enacted to expedite the reintegration of veterans of World War II into civilian life Following its enactment a number of questions arose concerning the application of the provisions of title II of the act relating to education, to medical officers Some of these questions were given consideration by the Committee on Postwar Medical Service, and when amendatory legislation was introduced in Congress to effect other changes in the law a statement was filed with the Senate Committee on Finance suggesting amendments to title II to clarify the uncertainties that obtained Some of these amendments were incorporated in the legislation that was approved by the President on Dec 28 1945 as Public Law 268 The Committee on Postwar Medical Service recommended

1 The removal of the requirement, in case of a veteran over 25 years old at the time of entry into service, that he show that his education was interrupted by service in order to qualify for educational benefits beyond the one year period Public Law 268 eliminates this requirement. The interruption of education by service is no longer an element that enters into the picture.

2 That the government pay, in the case of short refresher courses, the tuition charged by the institution, subject to the $500 limitation, and not prorate the tuition fee as had been considered necessary under the original law For example, if a returned medical officer pursued such a course for eight weeks at a cost of $250, under the original law the government would pay not the $250 but the proportion of $500 that eight weeks bore to an ordinary school year, say of thirty-two weeks, or would pay one fourth of $500, and the medical officer was required to pay the remainder Public Law 268 provides that, in the example used, the government will pay the entire $250 and there will be charged against the medical officer's period of eligibility the proportion of an ordinary school year which the cost of the short course bears to $500

3 That the educational benefits be made available to veterans during the terminal leave Public Law 268 provides that the benefits of titles II and III, relating to education and to loans, are available to veterans on terminal leave or while hospitalized pending final discharge, except that subsistence allowances are not payable during such period This particular amendment was made effective as of June 22, 1944

4 That accredited hospitals be specifically recognized in the law as being within the definition of an educational institution and as such entitled to tuition payments on behalf of former medical officers serving internships or residencies and that the interns or residents be declared to be students and as such entitled to subsistence allowances These particular recommendations were not enacted into law by the Congress, primarily because the questions involved were settled administratively Under the administrative ruling, hospitals are considered educational institutions and will be entitled to tuition fees, former medical officers serving residencies and internships will be entitled to subsistence allowances of $65 a month if without dependents and $90 a month if they have dependents

Another change in the law not specifically recommended by the Committee on Postwar Medical Service permits the veteran to elect to foreshorten his period of eligibility by having paid for him the cost of an educational course in excess of $500 for an ordinary school year If he does so there will be charged against his period of eligibility the proportion of an ordinary school year which such excess bears to $500

*Department of Medicine and Surgery in Veterans Administration*—On Jan 3, 1946 the President approved, as Public Law 293, a bill establishing a Department of Medicine and Surgery in the Veterans Administration The provisions of this law were analyzed by the Bureau and that analysis published in THE JOURNAL for January 5 The objective of this law is to provide a better quality of medical care for veterans by the offering of greater financial inducements to physicians to associate themselves with the Veterans Administration, by providing for the selection and retention of medical officers without regard to civil service requirements, by affording opportunities for medical officers to qualify as specialists with added compensation, by affording opportunities for postgraduate education and by establishing residencies in veterans' hospitals The new law contains one paradoxical provision in that it authorizes the employment of osteopaths in the Medical Service of the Veterans Administration.

*Industrial Health Under Jurisdiction of Labor Department*—The House of Delegates, at its Chicago 1945 meeting, adopted resolutions in opposition to S 1271 and H R 525, companion bills to provide for cooperation with the state agencies administering labor laws in establishing and maintaining safe and proper working conditions in industry and in the preparation, promulgation and enforcement of regulations to control industrial health hazards The basis of the opposition was that the legislation would permit labor departments "to undertake industrial hygiene activities now being done by federal and state public health agencies" The House expressed the view that any expansion of tax supported industrial hygiene services should be developed in a manner to provide immediate or ultimate responsibility for direction of the program by the state departments of health in cooperation with the United States Public Health Service In compliance with the directive of the House, copies of these resolutions were forwarded to each member of the House Committee on Labor and the Senate Committee on Education and Labor and in addition to each physician member of Congress

The House bill, H R 525, is still pending before the House with a favorable committee report S 1271, in a revised form, has been favorably reported by the Senate Committee on Education and Labor

*Federal Hospital Building Program*—The Hill-Burton hospital construction bill, S 191, was passed by the Senate, December 11, in substantially the same form in which it was reported by the Senate Committee on Education and Labor, despite the efforts of Senators Wagner and Murray to induce the Senate to amend the bill The amendments proposed by these two Senators would have stripped the National Hospital Council of all powers other than solely advisory, would have conferred on the Surgeon General jurisdiction over the maintenance and operation of hospitals to be constructed under the legislation and would have in other ways increased the federal regulatory powers over hospitals

In the House of Representatives S 191 was referred to the Committee on Interstate and Foreign Commerce and hearings were scheduled by a subcommittee, of which Representative Priest of Tennessee is chairman Representatives of the Association appeared before the subcommittee on March 7 in support of the bill At the time this report is being prepared the House Committee has taken no further action on the legislation

Following the passage of S 191 by the Senate, Representative Priest introduced a revised version of the bill, H R. 5628, which follows closely the provisions of S 191 with the exception that it embodies the amendments that Senator Murray and Senator Wagner sponsored in the Senate. This bill is pending in the House Committee on Interstate and Foreign Commerce

Another bill has been introduced in the House, H R 5014, sponsored by Representative Lyndon B Johnson, Texas, which suggests a somewhat different approach to the problem of providing needed hospital facilities It is pending in the House Committee on Banking and Currency and proposes to make available through the Reconstruction Finance Corporation an amount not in excess of $500,000 000 to aid municipalities and nonprofit organizations to provide adequate hospitals and public health centers Grants would be made for the cost of planning, constructing, improving or enlarging any hospital or public health center in an amount not to exceed 40 per cent of the cost thereof Loans would be made for a term not to exceed forty years and at a rate of interest not to exceed 2 per cent per annum for so much of the amount necessary for carrying out a project as is in excess of the amount made available as a grant or the amount made available from nonfederal sources

An applicant for a loan or grant under this bill would be required to submit proof satisfactory to the Reconstruction Finance Corporation that, among other things, the project has been approved by the highest public health agency of the state and that the services to be furnished by the hospital or health center will be of a satisfactory quality in accordance with standards prescribed by the state. Proof also will be required that the hospital or public health center is necessary to supply adequate hospital and health services in the particular region. A provision in the bill would make available not more than 40 per cent of the capacity of the facilities of the hospital or public health center, at a reasonable cost, for the supplying of medical and hospital treatment for veterans, if requested by the Administrator of Veterans' Affairs.

No provision is contained in the bill for an overall state survey to determine the need for additional facilities or to set up a pattern for the proper distribution of facilities that are determined to be needed.

*Aid to the Physically Handicapped*.—A special committee of the House Committee on Labor, created to make a study of the extent and character of aid given to the physically handicapped—the Kelley Subcommittee on Aid to Physically Handicapped—has published the results of its hearings so far in twenty parts. In addition to the parts mentioned in the last report of the Bureau, separate parts have been published dealing with monopolies and advertising affecting the welfare of the physically handicapped, epilepsy, accident prevention, cancer, tuberculosis, amputees, international activities relating to the physically handicapped, aid rendered by the Library of Congress to the physically handicapped, narcotics, employment of the physically handicapped and spastics. Currently the subcommittee is holding hearings on the physically handicapped in rural areas.

Under date of Jan. 22, 1946 Representative Sparkman, Alabama, introduced H. R. 5206, a bill to establish a Federal Commission for the Physically Handicapped, to define its duties and for other purposes. This bill has been referred to the Kelley subcommittee for further consideration and hearings by the subcommittee began on the bill April 30. It proposes a Federal Commission for the Physically Handicapped as an agency of the United States Department of Labor and would transfer to that commission the Office of Vocational Rehabilitation from the Federal Security Agency. A similar transfer would be effected of all Special Units for Handicapped Persons now operating in the War Manpower Commission, United States Employment Service.

The commission will be authorized (1) to provide for medical, surgical and therapeutic treatments the application of prosthetic or orthopedic appliances, hearing aids, eyeglasses and such other devices as may, by their use, enable physically handicapped persons to earn their living wholly or in part, (2) to provide for the education and training of physically handicapped citizens, and (3) to provide, whenever possible, for their suitable employment through proper placement.

Separate divisions will be established in the commission for special work with the deaf, the hard of hearing, cardiac patients, the tuberculous, the poliomyelitic, the epileptic, amputees and other large or distinct groups of the physically handicapped. The commission will be charged with the duty of collecting and publicizing statistics pertaining to the physically handicapped, of ascertaining fields of employment available to the physically handicapped, of acquainting employers in private industry with the special capabilities of the physically handicapped and encouraging their employment, and of cooperating with public and private agencies, organizations and individuals in the medical and vocational rehabilitation and placement of physically handicapped citizens.

The bill would authorize the commission to establish a register of qualified disabled persons who, on account of congenital deformity or of injury or disease are substantially handicapped in obtaining or retaining employment and would impose a duty on every employer, in filling vacancies to take into employment registrants to the number ascertained to be his quota.

A revolving fund of $5 000,000 would be established from which the commission would make personal catastrophe loans to individuals to aid their return to useful and gainful employment. Other sections would provide a pension of $30 a month to persons who are not feasible for rehabilitation and who are totally and permanently disabled and without means of livelihood or support and would authorize an appropriation of $10,000 000 for the first year and $5 000,000 for each of the succeeding five years to establish and maintain special industries for physically handicapped citizens.

An appropriation of $2 000 000 for the first year and $1,000,000 annually thereafter would be authorized for grants to local, nonprofit groups organized with the objective of providing a means of teaching and training physically handicapped persons who are confined to their homes or beds. The utilization of ten war plants as training schools for physically handicapped citizens and for teacher training is contemplated. An appropriation of $2,000 000 is to be authorized for use by the Public Health Service in research with respect to the cause and cure of deafness, and the bill indicates that other titles will be added covering grants to the Public Health Service for clinics for the treatment of poliomyelitis and epilepsy.

The pendency of this legislation was brought to the attention of the Association by Representative Kelley, who asked for comments on the bill. This communication was given preliminary consideration by the Executive Committee of the Board of Trustees, which decided to defer comments on it until hearings on the legislation appeared imminent. It was thought desirable too that the reactions of the Council on Industrial Health be obtained to aid the Board of Trustees in reaching a determination as to what position should be taken by the Association with respect to the bill. The Council did discuss the provisions of this legislation at its March meeting following which a statement was formulated by the Council, reading as follows:

> It is the conviction of the Council on Industrial Health that physical restoration is the fundamental principle in the rehabilitation of the crippled and disabled. This is a principle well recognized not only by the medical profession but by industry and other agencies. State rehabilitation agencies have also acknowledged this principle. During the past two years the federal government through its Office of Vocational Rehabilitation has acknowledged it by establishing physical restoration services as part of the federal state plan for the rehabilitation of the physically handicapped persons in this country.
>
> Physical restoration services can be adequately carried out only under medical direction and supervision. The correction of surgical defects, the provision of prosthetic appliances and the administration of other medical, surgical and physical measures require the professional control by competent and trained physicians in order to secure the maximum benefit of these services to the handicapped. The Office of Vocational Rehabilitation by virtue of the Barden-LaFollette amendment is now carrying out such a program with medical participation of the U. S. Public Health Service. It is too soon to evaluate the effectiveness of this program but an opportunity to study its results should be fostered in order to determine its effectiveness and necessity for modification if indicated.
>
> For these reasons the Council on Industrial Health is opposed to the provisions of H. R. 5206 transferring the control and operation of this service to a new commission.

Following receipt of a copy of the foregoing statement authorization was obtained from the Board of Trustees to proceed with arrangements for representation on behalf of the Association at the hearings on the bill. That representation was made on May 3.

*Wagner-Murray-Dingell Bill—Social Security Legislation*.—Hearings on S. 1606 before the Senate Committee on Education and Labor began on April 2 and are continuing at the present time. Arrangements have been made to secure a daily transcript of the testimony, which will be abstracted and printed in THE JOURNAL. In this manner the profession will be fully and promptly informed of developments in connection with the progress of this bill.

Senator Pepper, in testifying in support of S. 1606 on April 2, referred to a bill that he has introduced, together with nine other members of the Senate Committee on Education and Labor, S. 1318 proposing to enact "The Maternal and Child Welfare Act of 1945." He expressed the view that S. 1606 should be amended to incorporate some of the provisions contained in S. 1318 and submitted eighteen amendments to S. 1606 to accomplish the objective he had in mind as follows:

1. Page 13, line 24. Insert after the word "children" the words "(under 18 years of age)."

2 Page 14, line 1 Insert after the word "services' the following 'in the community, by providing supplementary personal health services needed by maternity cases or children entitled to personal health service benefits under title II of this act, and any personal health services needed by maternity cases or children not entitled to such benefits"

3 Page 14, line 3 Insert after the word "demonstrations" the following "research"

4 Page 14, delete lines 5 and 6 and substitute the following to be appropriated for the fiscal year ending June 30, 1947, the sum of $50,000,000, and for each fiscal year thereafter a sum sufficient to carry"

5 Page 17, delete lines 3 and 4 and substitute the following 'authorized to be appropriated for the fiscal year ending June 30, 1947, the sum of $25,000,000, and for each fiscal year thereafter a sum sufficient"

6 Page 14, line 18 Insert at end of line "Provided that, to the extent feasible, the plan shall be submitted by the same state health agency as that utilized by the Surgeon General in furnishing services under title II, sec 203(e)"

7 Page 14, line 17 Delete the word "the" before the word 'state' and substitute the word "a"

8 Page 38, line 4 Change period to comma and insert provided that, the Surgeon General shall, to the extent feasible, utilize the same state health agency as that submitting, and having approved, plans under title I, part B, sec 121"

9 Page 16, line 1 Insert the word "community" before the word "services"

10 Page 16, line 4 Delete the word "and" at the end of the line and add subsection (9), as follows "(9) provide that as personal health services are furnished under the plan they shall be available to all maternity cases and to all children in the state or locality who are not entitled to such services as benefits under title II of this act and who elect to receive such services under the plan."

11 Page 16 After new subsection (9) insert new subsection (10) to read as follows "(10) provide for granting to any mother or person acting in behalf of a child whose claim with respect to care or services under the plan is denied, or to any physician or other person, organization or institution participating or desiring to participate in furnishing services or facilities under the plan an opportunity for a fair hearing before the state health agency"

12 Page 16 line 5 Change the numbering of old subsection (9) to subsection (11)

13 Page 24, line 3 Insert after the word "members" the following "and, as necessary, technical advisory committees"

14 Page 25, after line 2, insert the following "(d) Under a state plan approved by the chief of the Children's Bureau with respect to sec. 121, personal health services may be provided through (1) payments to the persons or institutions furnishing such care, or (2) direct provision of such care, or (3) through arrangements by the state agency with the Surgeon General of the Public Health Service for services furnished under title II of this act, on the basis of equitable payments to the Personal Health Services Account established under title II of this act, or through any combination or modification thereof"

15 Page 25, line 3, change "(d)" to "(e)"

16 Page 37, line 3, insert the following at the end of the line "including payments to state agencies for personal health services given in accordance with arrangements made by the Surgeon General with such state agencies under plans approved under title I"

17 Page 78, line 7, insert new sec. 301 as follows "Sec 301 Whenever funds are paid to a single state agency under two or more parts of title I, or under one or more of such parts and also under title II, the state agency may commingle such funds and account therefor by such accounting, statistical, sampling or other methods as may be found by the federal administrative officer or officers authorizing such payments to the state agency to afford reasonable assurance that such funds are expended for the purposes of the respective parts or titles of this act"

18 Page 78, line 7 Change numbering of "sec. 301" to "sec 302"

In explaining these proposed amendments, Senator Pepper stated that they would provide (1) that the Children's Bureau and the state health agencies, through the provisions of title I, part B, will be responsible for providing and maintaining services and facilities to promote the health of mothers and children under 18 years of age, including adequate maternal and child health services in the community, (2) that the cost of personal health services benefits for insured persons and their dependents, including maternity care and medical care of dependent children, will be met through the provisions of title II (within the limitations of those benefits) administered by the Surgeon General of the United States Public Health Service (3) that the cost of maternity care and medical care of children under 18 years of age in noninsured families that elect to participate, and also the cost of supplementary personal health services for insured maternity patients and children, will be met through title I, part B, administered by the Children's Bureau and state health agencies (4) that, to the extent feasible, the Surgeon General will utilize, and the chief of the Children's Bureau will make grants to, the same state health agency, (5) that the state health agency may provide personal health services under its approved maternal and child health plan through payments to persons or institutions furnishing care, through direct provision of such care, or through arrangements with the Surgeon General to utilize the insurance system, and reciprocally, the Surgeon General may utilize the state agencies and make payments to them for personal health services provided by such agencies for insured persons, (6) specific sums for the initial year of the maternal and child health services beginning July 1, 1946 in the amount of $50,000,000, for crippled and otherwise physically handicapped children, $25,000,000 and thereafter the authorizations are for sums sufficient to carry out the purposes of the programs, (7) for the appointment of technical advisory committees to advise the Children's Bureau in its administration of the program, (8) opportunity for fair hearing to any mother or person acting in behalf of a child or to any physician or agency participating or desiring to participate under a state plan, and (9) that a state agency receiving funds under two or more parts or titles of this act may pool such funds, provided the state accounts for the funds to the federal administrative agencies in a way that affords reasonable assurance that the funds are expended for the purposes of the respective parts or titles of the act

Senator Pepper indicated that if action on S 1606 could not be obtained he would press for committee consideration of S 1318

Senator Murray has requested representatives of the Association to appear to testify on S 1606 on April 17 and plans have been completed to make that presentation

Under date of March 18 Senator Murray communicated with professional organizations in the field of health and medical care requesting that they join in a cooperative attempt to stake out specific health goals for the coming five years In connection with this communication he submitted a number of questions on Health Goals for America's Future and asked the organizations with which he corresponded to submit answers to these questions Such a communication was sent to the American Medical Association and is receiving attention Here are the questions that Senator Murray submitted

I Over the next five years, what should be our goals on the nation's health?

What should our aims be with respect to increasing the average expectation of life?

What should be our aims in reducing (a) the infant mortality rate? (b) the maternal mortality rate? (c) the death rate at various ages?

What should our aims be in preventing or controlling (a) heart disease, (b) cerebral paralysis, (c) cancer, (d) tuberculosis, (e) diabetes, (f) pneumonia, (g) poliomyelitis, (h) rheumatism and arthritis, (i) rheumatic fever, (j) venereal disease, (k) malaria, (l) dental defects, (m) defects of vision, (n) defects of hearing and (o) mental ill health?

II Over the next five years, what should be our goals on health personnel, facilities and education?

What should be our aims with respect to the number and distribution of qualified (*a*) doctors, (*b*) dentists and (*c*) nurses?

What should be our aims with respect to the number and distribution of adequate (*a*) hospitals and hospital beds, (*b*) health clinics and health centers and (*c*) sanitation facilities?

What should our aims be with respect to (*a*) medical research, (*b*) professional medical education and (*c*) health education for the public?

Numerous bills are still pending proposing to extend the coverage of the Social Security Act. The House Committee on Ways and Means has scheduled a series of hearings in an effort to determine what changes are necessary and early in 1945 appointed a Social Security Technical Staff which has been working on the subject for many months. On January 17 this Technical Staff submitted a 742 page report to the committee entitled "Issues in Social Security." The report seems to be an objective presentation of the more important aspects of (1) old age and survivors' insurance, including extended disability (2) old age assistance, aid to dependent children, aid to the blind and general assistance, and (3) unemployment compensation. It suggests that social security in its broader sense includes provisions for programs outside the area covered by the study of the Technical Staff, such as public health, vocational rehabilitation, maternal and child health services and programs of general medical care, hospitalization, cash sickness benefits and cash maternity benefits. These aspects of social security are not explored in this initial report, but recognition is given to their importance.

Whether or not the House Committee on Ways and Means will give any serious consideration to the initial version of the 1945 edition of the Wagner-Murray-Dingell bill, H. R. 3293, which is still pending before the committee, is problematic.

*The Taft-Smith-Ball National Health Bill.*—On May 3 of this year Senator Taft, Ohio, for himself and Senator Smith, New Jersey, and Senator Ball, Minnesota, introduced S. 2143, a bill to "coordinate the health functions of the Federal Government in a single agency, to amend the Public Health Service Act for the following purposes: To expand the activities of the Public Health Service, to promote and encourage medical and dental research in the National Institute of Health and through grants-in-aid to the States, to construct in the National Institute of Health a dental research institute and a neuropsychiatric institute and for other purposes." The bill was referred to the Senate Committee on Education and Labor, before which is pending the current version of the Wagner-Murray-Dingell bill, S. 1606.

The Taft-Smith-Ball bill contains three titles. Title I would create a National Health Agency to which would be transferred designated health activities now carried on by the federal government. Title II proposes amendments to the Public Health Service Act to authorize appropriations for allotments to the states to enable them to provide for general medical service for families and individuals with low income and for dental health services for school children and families and individuals with low income. Additional appropriations would be made available for general medical health research for neuropsychiatric research and for dental research. The third title proposes amendments to existing laws that would be necessary if the bill is enacted and also would authorize payroll deductions from the salaries of government employees to facilitate their participation in nonprofit medical, hospital and dental care plans.

To enable the states to provide general health, hospital and medical services for families and individuals with low income, an appropriation of $200 000 000 for each of five fiscal years would be authorized for making payments to the states that have submitted and had approved by the Surgeon General plans for providing these services. The bill specifies certain requirements that a state plan must meet in order to be approved but specifically denies to the Surgeon General any right to disapprove a plan because he may disapprove of the *methods* suggested by the state to accomplish the objective of the legislation, namely, to assure within a five year period hospital, surgical and medical services in hospitals, clinics or medical or similar institutions for all persons having insufficient income to pay the whole cost of such services. A similar but smaller appropriation will be authorized to enable the states to provide dental services for the needy.

Both Senator Taft and Senator Smith, on the day the bill was introduced, emphasized their view that the philosophy back of the bill was entirely foreign to the philosophy inherent in the Wagner-Murray-Dingell bill in that S. 2143 puts the responsibility directly up to the states to determine their own health programs with aid from the federal government and limits application of the program to persons in the low income groups.

A detailed analysis of this bill is being prepared by the Bureau and will be published in THE JOURNAL.

*Prevention of Disease.*—Companion bills have been introduced to request the President to undertake to mobilize at some convenient place in the United States an adequate number of the world's outstanding experts and coordinate and utilize their services in a "supreme endeavor to discover means of curing and preventing cancer," S. 1875, introduced by Senator Pepper, Florida, and pending in the Senate Committee on Foreign Relations, and H. R. 4502, introduced by Representative Neely, West Virginia, and pending in the House Committee on Foreign Affairs. This legislation would authorize an appropriation of $100,000,000 to enable the President to carry out its provisions.

Senator Langer, North Dakota, has introduced S. 1883, S. 1888 and S. 1891, proposing, respectively, to authorize an appropriation of $3,750 000,000 for each of the following purposes: (1) to enable the Surgeon General of the Public Health Service to carry out programs for the prevention, diagnosis and treatment of cancer, (2) to become available for disbursement to Sister Elizabeth Kenny for use in establishing and maintaining facilities for the hospitalization and treatment of persons suffering from infantile paralysis and for investigation and research with respect to the origin and means of control of that disease, and (3) to enable the Surgeon General of the Public Health Service to provide the means for securing a specimen of urine of each person in the United States and the examination and analysis of such specimen, the findings to be made available to the person furnishing such specimen and if the examination and analysis disclose the existence of a disease, a report to be made to the health authorities of the municipality or county wherein the person resides. All these bills are pending in the Senate Committee on Education and Labor.

A House Joint Resolution, H. J. Res. 324, introduced by Representative Norrell, Arkansas, proposes to request the President to issue a proclamation designating the 28th day of October of each year as National Arthritis Day. It is pending in the House Committee on the Judiciary.

Another bill, H. R. 4279, introduced by Representative Lane, Massachusetts, would authorize an appropriation of $50 000 for use by the United States Public Health Service in conducting research with respect to the cause and cure of hay fever. The bill is pending in the House Committee on Interstate and Foreign Commerce.

H. R. 5715, introduced by Representative Stevenson, Wisconsin, proposes to establish a National Medical Research Foundation to initiate, conduct and support scientific research with respect to the cause and cure of cancer, poliomyelitis, rheumatic fever, Bright's disease, hay fever, asthma, arthritis, leukemia, encephalitis, arteriosclerosis, aplastic anemia and rheumatic heart disease. The powers of the foundation will be exercised by a governing board of three members, consisting of the Surgeon General of the United States Public Health Service, the President of the American Medical Association and the president of the American Cancer Society. To enable the foundation to carry out its powers there will be authorized to be appropriated if the legislation passes, the sum of $100 000 000 to remain available until expended.

*Optometry and Podiatry Corps in the Medical Department of the United States Army.*—The House of Representatives on Sept. 18, 1945 passed H. R. 3755, a bill to establish an Optometry Corps in the Medical Department of the United States Army. The Senate Committee on Military Affairs on

Feb. 21, 1946 reported this bill to the Senate with the recommendation that it pass. It is now pending before the Senate.

Representative Traynor, Delaware, proposes by H. R. 5761 to establish a Chiropody Corps in the Medical Department of the Army. It is pending in the House Committee on Military Affairs.

*National Mental Health Act.*—A bill introduced by Representative Priest, Tennessee, H. R. 4512, to enact a National Mental Health Act, was passed by the House of Representatives March 15, 1946. It proposes an appropriation of $4,500,000 for the erection and equipment, for the use of the Public Health Service in carrying out the provisions of the legislation, of suitable and adequate hospital buildings and facilities, to be known as the National Institute of Mental Health. It is contemplated that these facilities will be constructed in or near the District of Columbia. The bill would provide for the admission and treatment at the National Institue of Mental Health, for purposes of study, of voluntary patients and patients of St. Elizabeths Hospital transferred from the hospital pursuant to arrangements made between the Surgeon General and the superintendent of the hospital, subject to approval of the administrator of the Federal Security Agency.

An annual appropriation of $10,000,000 would be made available for use by the Public Health Service in carrying out the purposes of the legislation including the making of grants-in-aid to universities, hospitals, laboratories and other public or private institutions, and to individuals for such research projects as are recommended by the National Advisory Mental Health Council.

A bill with a similar objective is pending in the Senate Committee on Education and Labor, S. 1160, introduced by Senator Pepper, Florida, for himself and Senator Thomas, Utah, Senator Tunnell, Delaware, Senator Hill, Alabama, Senator Murray, Montana, Senator La Follette, Wisconsin, and Senator Aiken, Vermont. Senate hearings have been concluded on this legislation, and it is anticipated that committee action will be forthcoming in the near future.

*Health of Children.*—Senator Morse, Oregon, has introduced S. J. Res. 137 to authorize the Secretary of Labor to make certain studies of the health of school children. It is pending in the Senate Committee on Education and Labor. This bill would authorize the Secretary of Labor, acting through the Children's Bureau and in cooperation with federal, state and local agencies and qualified institutions of higher education, (1) to make studies of the health and physical status of children of school ages, (2) to make studies of the facilities and services offered by schools for the correction of physical defects of children of school ages and (3) to recommend the use of, and to demonstrate in representative urban and rural areas methods of conducting school health examinations and providing school health services. This legislation suggests a three year program and contemplates an appropriation of $100,000 for the first year and $450,000 for each of the succeeding fiscal years.

A bill introduced by Representative Luce, Connecticut, H. R. 5960, proposes to establish a Department of Children's Welfare. It is pending in the House Committee on Expenditures in the Executive Departments. The new department will have jurisdiction, it is proposed, over the activities of the government relating to the health, educational opportunity and welfare of children in the United States. The functions, powers and duties heretofore exercised by the Secretary of Labor and the chief of the Children's Bureau in these fields would be transferred to the secretary of the department. Certain other functions now exercised by the Social Security Board in relation to grants to states for aid to dependent children would also be transferred to the new department. The Children's Bureau in the Department of Labor would be abolished and all officers and employees of that bureau transferred to the department.

*Dangerous Drugs.*—On March 8, 1946 the President approved, as Public Law 320, a new law to provide for the coverage of opiates under the federal narcotic laws. The word "opiate" is defined to mean any drug (as defined in the Federal Food, Drug and Cosmetic Act) found by the Secretary of Treasury after due notice and opportunity for public hearing, to have an addiction-forming or addiction-sustaining liability similar to morphine or cocaine, and proclaimed by the President to have been so found by the secretary.

Representative Rogers, Massachusetts, has submitted H. Res. 440, calling on the Secretary of the Treasury to furnish to the House of Representatives, for its information, (1) such facts as may be in his possession regarding the use by the public of the barbiturates and (2) the facts with respect to the best method or methods of protecting the consuming public from the improper use of barbiturates resulting from the indiscriminate distribution and sale of such drugs. The purpose of this resolution would seem to be to obtain factual data on which to base federal legislation. Representative Rogers has caused to be inserted in the *Congressional Record* on several occasions material reflecting abuses in the use of the barbiturates and stated on the floor of the House, when the conference report on the law referred to in the preceding paragraph was discussed, that if the barbiturates were not covered by that law she would submit additional legislation. Other members of the House indicated that they would support such legislation when introduced.

As forecast in the preceding paragraph, Representative Rogers did on April 17 introduce H. R. 6178, a bill to provide for the coverage of barbiturates under the federal narcotic laws. While the objectives of this legislation are undoubtedly meritorious, its enactment would represent a continuation of a trend to confer more and more jurisdiction on the federal government over intrastate matters in the field of medicine. The federal narcotics laws were amended several years ago to bring within their purview a new drug marketed under the trade name of Demerol but referred to in the amendatory legislation as isonipecaine. More recently, as indicated previously, "opiates" have been brought under the federal narcotic laws. If this trend continues, the time may come when no drug that may be of harm to a patient if used unwisely can be prescribed by a physician without the consent of the federal government.

A bill introduced by Senator Bilbo, Mississippi, S. 1986, has been favorably reported by the Senate Committee on the District of Columbia, proposing to bring the barbiturates within the purview of the laws of the District of Columbia relating to the manufacture, sale, distribution and use of narcotics.

There is a growing concern over the extent of the misuse of the barbiturates. In October 1945 the Committee on Legislation of the American Pharmaceutical Association called a conference in Washington to discuss the regulation of the use and distribution of barbiturates and that conference was participated in by representatives of numerous organizations, including two representatives from the Association. The consensus of the members of the conference was that there is a definite need for a more effective legislative program. It was pointed out that at that time over-the-counter sale of the barbiturates was permissible in fourteen states and the District of Columbia, namely:

| | |
|---|---|
| Arizona | Massachusetts |
| Idaho | Missouri |
| Illinois | New Mexico |
| Indiana | Ohio |
| Iowa | Texas |
| Kansas | Wisconsin |
| Kentucky | Wyoming |

It was further pointed out that, even in those states in which legislation had been enacted, enforcement left much to be desired. A recent communication from the American Pharmaceutical Association in connection with this matter was referred to the Council on Pharmacy and Chemistry and will no doubt be brought to the attention of the House of Delegates.

The Bureau has from time to time in its annual reports called the attention of the House to legislation relating to the barbiturates. In 1941 the Reference Committee on Reports of

Board of Trustees and Secretary, in commenting on the report of the Bureau of Legal Medicine and Legislation, had this to say

> It is noted that twenty five states have now adopted legal measures to control the dispensing of barbiturates only in medical prescriptions Your reference committee recommends to the House of Delegates that efforts be put forth to stimulate the remaining states to adopt similar legislation

This recommendation of the reference committee was adopted by the House The Bureau has attempted to stimulate the enactment of legislation of this type and has met with some degree of success Since the action taken by the House, however, many physicians have been in war service, and state medical associations have reduced their legislative efforts to a minimum Now that hostilities have ceased, it will be helpful if the House reemphasizes the view it expressed in 1941

*Medical Care for Veterans*—A bill introduced by Representative Rogers, New York, H R 5685 proposes to provide for the national health and productive power of the people of the United States by clarifying the laws pertaining to hospital treatment, medical care, domiciliary care and related services for veterans It is pending in the House Committee on World War Veterans Legislation and would provide, among other things that any center, hospital, home or clinic now or later under contract, control and jurisdiction of the Veterans Administration, War Department, Navy Department or the Public Health Service shall be available for the admission of any veteran of any war since 1897, not dishonorably discharged without regard to the nature of his or her disease or disability Prior to the construction of adequate facilities to take care of all veterans requiring hospitalization, the bill proposes that any veteran excluded from a governmental facility because of lack of beds will be permitted to enter a private hospital of his own choice, and the Veterans Administration will be authorized to pay the expenses of such hospitalization.

This bill also would authorize an appropriation of $550,000,000 for the construction of 57,000 additional hospital beds It would also authorize the President to establish six Diagnostic, Research and Proving Centers to be made available for use by any person for the exploration and testing of his or her medicine, drug science or treatment The administrator of such a center will be authorized to require the submission of case histories of not more than 10 patients who subscribe under oath that their disease, condition or 'frustration" has been improved by the method of treatment to be tested in the center

S 1817, introduced by Senator Langer, North Dakota, provides that, in any case in which a person entitled to medical care and treatment and hospitalization under the laws administered by the Veterans Administration cannot be treated or hospitalized at a government facility within a reasonable distance from the place of his residence, the administrator will be authorized to provide for such medical care and treatment by private physicians and for hospitalization in nongovernmental hospitals This bill is pending in the Senate Committee on Finance.

*National Science Foundation*—In the report of the Bureau for last year, extended reference was made to proposals pending in the Congress to formulate a federal program in support of scientific research. At that time two particular bills occupied prominent positions, the Magnuson bill, S 1285, pending in the Senate Committee on Commerce, and the Kilgore bill, S 1297, pending in the Senate Committee on Military Affairs Subsequently subcommittees of the two Senate committees held joint hearings in an effort to adjust the differences in the two measures, and as a result a compromise bill was introduced as S 1720 This measure was given additional consideration by the two subcommittees and on February 21 Senator Kilgore, West Virginia, for himself and Senator Magnuson, Washington, Senator Johnson, Colorado, Senator Pepper, Florida, Senator Fulbright, Arkansas, Senator Saltonstall, Massachusetts, Senator Thomas, Utah, and Senator Ferguson, Michigan, introduced a new bill, S 1850, which has the joint support of the two Senate subcommittees It has been reported by the Senate Committee on Military Affairs with recommendation that it pass

This bill would create an independent agency of the federal government to be known as the National Science Foundation, administered by an administrator appointed by the President, by and with the advice and consent of the Senate and after consultation with the National Science Board to be created by the legislation Within the foundation will be a Division of Mathematical and Physical Sciences, a Division of Biological Sciences, a Division of Social Sciences, a Division of Health and Medical Sciences, a Division of National Defense, a Division of Engineering and Technology, a Division of Scientific Personnel and Education, a Division of Publications and Information, and such additional divisions, not to exceed three in number, as the administrator may from time to time establish after receiving the advice of the board

The administrator will be required to consult and advise with the National Science Board and with divisional scientific committees on all matters of major policy, program or budget. The board will consist of nine members appointed by the President from among persons who are especially qualified to promote the broad objectives of the legislation, plus the chairmen of the several divisional scientific committees These committees, except the committee for the Division of National Defense, will consist of not less than five nor more than fifteen members appointed by the administrator with the advice and approval of the board

The board will be required continuously to survey the activities of the foundation, and each divisional scientific committee will likewise be required to survey the scientific field which it encompasses The board and each committee will be required, on its own initiative or on request by the administrator, to make appropriate recommendations and reports relating to its duties and findings

Both the administrator and the board will be required to make annual reports to the President and to the Congress which will include such independent recommendations concerning the budget, organization and management of the foundation and such other recommendations as the board and the divisional scientific committees may deem necessary

The administrator will be authorized to enter into contracts or other arrangements pursuant to which he will finance, in whole or in part, or otherwise support, research and development activities to be carried on by other government agencies or by other organizations Of the funds appropriated for research and development activities, not less than 15 per cent will be made available for expenditure for research and development in each of the following fields (1) national defense and (2) health and medical sciences Not less than 25 per cent of the funds appropriated for research and development activities will be apportioned among the states to be expended for carrying on research and development activities in the facilities of tax-supported colleges and universities Provision is made for the award of scholarships and fellowships to persons for scientific study or scientific work, and the administrator is required to maintain a register of scientific and technical personnel

The bill provides for the use and dissemination of scientific findings, for reciprocal agreements with foreign governments or agencies relating to the interchange of scientific and technological information and for the establishment of an interdepartmental committee on science to assist the administrator in gathering and correlating data relating to the scientific research and development activities of the federal government The Office of Scientific Research and Development and its constituent committees will be transferred to the foundation.

*Health Programs for Government Employees*—A bill providing for health programs for government employees, H R 2716, introduced by Representative Randolph, West Virginia, was passed by the House of Representatives Sept. 24, 1945 and in the Senate was referred to the Committee on Civil Service. By that committee it was reported, with amendment, on November 15 but was recommitted to the committee December 7 and again reported with amendments, February 1 It is now pending before the Senate.

As finally reported it authorizes the heads of departments and agencies including government owned and controlled corporations to establish by contract or otherwise health programs which will provide health services for employees under their respective jurisdictions These services will be established only

on recommendation of the Civil Service Commission, after consultation with the Public Health Service and only in localities where there are a sufficient number of federal employees to warrant the provision of such services The services to be provided will be limited to (1) treatments on the job of illnesses and dental conditions requiring emergency attention, (2) preemployment and other examinations, (3) the referral of employees to private physicians and dentists and (4) preventive programs relating to health. *An amendment recommended by* the Senate Committee on Civil Service will authorize the utilization of osteopathic services in connection with programs that are formulated

It has been suggested in connection with this legislation, that government employees be given the right to authorize payroll deductions from wages to permit them to participate in prepayment plans, hospitalization and medical care With the exception of two departments, the Department of Agriculture and the Department of Commerce, specific statutory authorization will be required to permit government employees to assign their wages for any purpose With respect to the two departments named, laws have already been enacted under which, subject to certain limitations, employees may authorize payroll deductions

*Miscellaneous*—H R. 491 and H R 5572, both introduced by Representative Lemke, North Dakota, and proposing to prohibit experimentation on living dogs in the District of Columbia, are still pending in the House Committee on the District of Columbia. Hearings have been concluded on this legislation, but no further committee action has been taken

A bill introduced by Representative Fellows, Maine, proposes that the provisions of all laws administered by the Veterans Administration which extend benefits to any woman who served honorably as a nurse, chief nurse or superintendent of the Nurse Corps under contract with the United States for ninety days or more between April 21, 1898 and Feb 2, 1901 be extended to any man who served honorably in any such capacity under contract with the United States for ninety days or more between such dates

A bill introduced by Representative Luce, Connecticut, H R 5296, provides that, commencing with the taxable year 1946, physicians, surgeons and dentists shall be allowed an additional credit as a deduction on their income tax equal in terms of percentages "to that portion of their time each year which is devoted to charity, free clinic work and/or public research work" It is pending in the House Committee on Ways and Means

S J Res 89, proposing the formation of an international health organization and commented on briefly in the report of the Bureau submitted to the House of Delegates in 1945, has been passed by the Senate

Representative Hebert Louisiana has introduced, by request, H R. 5406, a bill to amend the District of Columbia Traffic Act of 1925 to provide for tests of blood, urine and breath of persons arrested in the District of Columbia for certain offenses including the offense of operating a vehicle while under the influence of intoxicating liquor

Companion bills would authorize the Federal Security Administrator to assist the states in matters relating to social protection S 1779, introduced by Senator Pepper, Florida for himself and Senator George, Georgia, Senator La Follette, Wisconsin, and Senator Taft Ohio, and *H R. 5234*, introduced by Representative Bolton, Ohio These bills are pending respectively in the Senate Committee on Education and Labor and in the House Committee on the Judiciary They would authorize the Federal Security Administrator, by means of technical and professional advisory services and by the collection and publication of information, to assist the several states and, through or at the request of appropriate state officials of the respective states, their political subdivisions, and to assist nongovernmental organizations (*a*) to develop and carry out, particularly in areas where such measures are of importance to military or naval personnel, measures designed to prevent prostitution, eliminate conditions contributing to sex delinquency and provide services for the rehabilitation of sex delinquents, and (*b*) to foster cooperation in communities between law enforcement, welfare and other public and private activities for the purpose of preventing prostitution, eliminating conditions contributing to sex delinquency and providing services for the rehabilitation of sex delinquents

## Bureau of Medical Economics

The staff of the Bureau of Medical Economics has devoted *the major portion of its time to assisting the Council on* Medical Service and Public Relations in compiling and analyzing data concerning the voluntary prepayment medical care plans The Bureau staff has also cooperated with the Council staff in other activities, since the subject matter is identical in most cases The Bureau's publications, source files and library provide valuable historical as well as some of the current information and data on most of the subjects considered by the Council on Medical Service and Public Relations

Collaboration has been carried on between the two staffs in preparing a digest of the policy of the American Medical Association regarding sickness insurance and in providing information on the cost of medical care, hospitalization insurance, group practice and vital statistics In replying to inquiries for material on these subjects, the previous publications of the Bureau have been used, as well as reprints of more current articles that have been prepared by both the Bureau of Legal Medicine and Legislation and the Council on Medical Service and Public Relations

During the period Dec. 1, 1945 to May 1, 1946 approximately 600 copies of Bureau publications have been distributed and 400 letters written The majority of letters have been replies to requests for material and data on sickness insurance, hospitalization insurance, mortality statistics and the cost of medical care. There also have been a number of requests from physicians for information on group medical practice.

### GROUP MEDICAL PRACTICE

The interest in group practice appears to be primarily among the younger physicians returning from military service. The advantage of associating with an established group or forming a group, which provides joint use of office facilities and equipment, is apparent in such cases The Bureau's report on group practice published in 1940 is still being used to provide information on the experiences of group practice arrangements More recent reports published by state or county medical societies are also referred to in answering inquiries on this subject.

### MORTALITY STUDY

Considerable time has been devoted to the study of deaths of physicians, which was begun in 1942 in cooperation with Dr Louis I Dublin, chief statistician of the Metropolitan Life Insurance Company The purpose of this study is to obtain data on the causes and rate of deaths among physicians as compared with the general population The basic data are collected by the Bureau of Medical Economics and submitted to the Metropolitan Life Insurance Company for final compilation

### REVISION OF THE BOOKLET 'FACTUAL DATA ON MEDICAL ECONOMICS'

The booklet "Factual Data on Medical Economics' first *published in 1939 and* revised in 1940, contains statistical and graphic presentations of the number of physicians and hospitals, and of vital statistics—general mortality and mortality for specific causes, including tables and charts showing comparative data on mortality rates in various countries Some of the preliminary work of collecting, tabulating and classifying the data needed to bring this report up to date has been done. It is expected that the revision will be completed during the summer

Vital statistics for this country are obtained from government agency reports, which were curtailed during the war years but are now being brought up to date fairly rapidly Similar data from foreign countries may not be available for some time, so that the comparative tables cannot be brought up to date very soon

INCOME OF PHYSICIANS

The average income of physicians as well as of other professional groups, has been compiled by the Bureau of Foreign and Domestic Commerce, United States Department of Commerce. From these reports tables have been prepared showing the average income of physicians for the years 1929 through 1941

CONSUMPTION EXPENDITURES

The United States Department of Commerce also collects and publishes data on consumers' expenditures for goods and services These figures provide a means for comparing average annual expenditures for medical care with average expenditures for other goods and services Tables derived from these reports have been prepared showing average expenditures per capita, and the ratio of expenditures under each major heading to total expenditures In 1942 expenditures for medical care, including physicians' services, hospital and nursing services, drugs, medicines, eye glasses and appliances, amounted to 3 4 per cent of the total expenditures for all goods and services, while expenditures for such items as recreation and entertainment were 5.2 per cent, alcoholic beverages 5 9 per cent, and tobacco 2 7 per cent of the total

## Bureau of Exhibits

The report of the Bureau of Exhibits includes the Scientific Exhibit at the annual session, Association exhibits and motion pictures Graduate medical instruction is the primary purpose of the Bureau, but health education of the public is also included as opportunity permits

THE SCIENTIFIC EXHIBIT

The Scientific Exhibit is administered under the direction of the Committee on Scientific Exhibit of the Board of Trustees

Preliminary arrangements for the Scientific Exhibit at the 1945 session in Philadelphia were well under way when the meeting was canceled because of wartime restrictions The cessation of hostilities during the year made it possible to start work on the Scientific Exhibit for the 1946 session at San Francisco and, in spite of the numerous difficulties of reconversion from war to peace considerable work was completed during the fall months of the year

ASSOCIATION EXHIBITS

The Association exhibits for medical societies and for fairs and expositions have been maintained and revised. Continual labor is necessary in checking these exhibits to keep them in repair and up to date. Several of the old exhibits were discarded since they were no longer serviceable, while others were rebuilt and new features added. Three new subjects were added "Food Poisoning" "The Menace of the Rat" and "How Disease Bacteria are Spread" All of these have proved to be popular Other subjects which have been in demand, in keeping with the times, include malaria, tropical diseases and the newer aspects of chemotherapy Lack of personnel in the various councils at headquarters made it impossible to develop contemplated exhibits dealing with physical medicine, industrial health and nutrition, but the new year will see progress in these fields

The larger fairs and expositions were canceled during the war, but there were numerous local meetings at which exhibits from the American Medical Association were displayed. In Milwaukee the Woman's Auxiliary held a successful Health Day with active participation by members of the Bureau In Akron a large department store had different health exhibits on continuous display for several months for the benefit of the employees These and other similar affairs resulted in the utilization of seventy-two health exhibits on fifty-six different occasions Exhibits were kept on display for periods varying from one day to several weeks

Medical meetings, few of which were held during the war, were resumed after V-J day, resulting in a sudden demand for medical exhibits Personnel from the Bureau attended seven such meetings with fourteen exhibits Attention is called to the amount of time and labor incident to exhibits at medical meetings The attendant must arrive the day before the meeting opens and remain until it is closed Extra care is necessary in preparation and installation, because exhibits from the American Medical Association are often taken as models in display methods

Exhibits are of value in both health education and graduate medical instruction That the visual impression is lasting and that the effort expended in exhibit work is worth the cost is evidenced by letters received concerning details of displays shown months or years previously

The Bureau has forty five exhibits for loan purposes described in the two pamphlets "Medical Exhibits for Medical Societies and Scientific Organizations" and "Health Exhibits for Fairs and Expositions"

MOTION PICTURES

The Bureau of Exhibits maintains a small library of medical motion pictures which have been in great demand by medical schools, medical societies hospitals and government agencies During the year seven hundred and thirty films were sent to three hundred and ninety-four meetings

Information about medical motion pictures in general has been kept on file, making it possible to answer hundreds of letters concerning the availability of medical films other than those distributed by the Bureau

A large collection of material on health films has been assembled which is useful in dealing with matters concerned with health education. No attempt has been made, however, to assemble a large number of health films at headquarters, since there are numerous distributors over the country

Active coooperation has been maintained with the National Film Board of Canada It has been impossible, however, to comply with the requests for films from other countries, including Mexico, Spain, Sweden, the Netherlands, France and Czechoslovakia. The need for good medical films in those countries is great, but the program for supplying them should be undertaken with the cooperation of all agencies concerned in the production of motion pictures

COMMITTEE ON MEDICAL MOTION PICTURES

The Board of Trustees appointed a Committee on Medical Motion Pictures to study the problems connected with motion pictures and to submit a report. The following recommendations were made by the committee

1 That information should be obtained concerning the facilities of medical schools and medical societies for using motion pictures and the extent to which those pictures are now used

2 That the American Medical Association should not produce motion pictures at the present time

3 That information should be assembled concerning the better use of motion pictures to encourage graduate medical instruction

4 That information should be assembled concerning the development of a program for the distribution of medical motion pictures

5 That medical motion pictures should be reviewed by competent authorities and critical reviews published in THE JOURNAL

The Trustees approved these recommendations and provided funds for personnel in the Bureau to carry them out Arrangements have been made for the program to go forward during 1946

MUSEUMS

The Bureau has cooperated with the various museums in the country where large audiences are found in a receptive mood for health education. At the Chicago Museum of Science and Industry and the Cleveland Health Museum a question and answer service is available which has proved successful. Exhibits on various subjects have been furnished to the Toledo Museum of Science and the Cayuga Museum of History and Art, Auburn, N Y, during the year With the return of normal times this activity will be expanded.

MISCELLANEOUS ACTIVITIES

Publications prepared in connection with the various activities of the Bureau have continued to be popular These include the fifth edition of the Primer on Fractures, the second edition of Fundamentals of Anesthesia and the revised editions of the pamphlets on Varicose Veins and Food Charts

## Committee on Therapeutic Research

The Committee on Therapeutic Research, a standing committee of the Council on Pharmacy and Chemistry, encourages scientific investigations in the field of therapeutics by providing funds for the prosecution of necessary research.

During the year 1945 the Committee issued twenty-two new grants A detailed list of these grants, together with a list of publications during 1945 and of unexpected grants made before Jan 1, 1945, will be found in the appendix to this report.

During 1945 the following grants were issued

Grant 536 C. H Werkman professor of bacteriology Iowa State of ulture and Mechanical Arts the mechanism of action

associate professor of pharmacology
Medicine the antidiuretic action of
em, $500
professor of medicine
of various

of Bacte
ano

Bacte

and

Conferences on matters pertaining to graduate medical instruction as well as health education by visual means have been held on numerous occasions with visitors from various parts of the United States as well as from other countries Collaboration with other agencies has been continued, with the Director of the Scientific Exhibit serving on various boards and committees These include the National Advisory Committee of the Cleveland Health Museum, the Committee on Exhibits of the Society of Illinois Bacteriologists, the Council of the Health Education Section of the American Public Health Association and the Advisory Committee on Health Education of the Tuberculosis Institute of Chicago and Cook County

The Director has maintained his position as assistant professor of bacteriology and public health at the University of Illinois College of Medicine

Speeches have been prepared, articles written for publication and books reviewed for THE JOURNAL and for HYGEIA.

## Bureau of Public Relations

The Bureau of Public Relations in the headquarters building of the American Medical Association extends to the medical profession, the press and the lay public information regarding the work of the American Medical Association and the progress of medical science as recorded in THE JOURNAL.

One of the Bureau's chief functions is to edit and distribute the weekly news pamphlet the AMERICAN MEDICAL ASSOCIATION NEWS, which contains official announcements and condensations of original articles and editorials appearing in THE JOURNAL and in HYGEIA This news release, containing material which may be reprinted or republished, is mailed to approximately 1,200 newspapers, press associations, magazines, radio stations, industrial house organs, medical journals and bulletins

The A M A NEWS, prepared under the supervision of the Editor of THE JOURNAL, has become a recognized medium for the dissemination of news pertaining to medical activities and medical progress That there is wide interest in articles on medical subjects is evidenced by the amount of such material to be found in even a casual perusal of a few magazines and newspapers All of those receiving the release have made specific, voluntary requests to have their names placed on the mailing list.

During 1945 the Bureau of Public Relations received more than 5,000 inquiries from newspapers, press associations, magazines, radio stations and other mediums

An estimated 75,000 individual stories, based on articles that appeared in THE JOURNAL and in HYGEIA, were published in newspapers in every state in the Union during the year The estimate is made on the basis of press clippings received in the headquarters office. The response to American Medical Association stories was much better because of the gradual relaxation of wartime restrictions on newsprint.

The two stories which received the greatest response from the press magazines and radio were the fourteen-point program for the extension of improved health and medical care to all people and the announcement by the Board of Trustees of a countrywide system of voluntary sickness insurance protection to be operated on a nonprofit basis by local medical groups In both cases lengthy stories were published in nearly every newspaper Reprints of the articles as they appeared in THE JOURNAL were mailed to every state medical journal for republication

The gratifying response which the Bureau received from the press during the year indicates strongly that editors, reporters, feature writers and radio news commentators from every section of the country look to the headquarters office of the American Medical Association as a dependable source of information regarding medical matters They have sought information and advice on every phase of the multiple activities of the Association and of the profession. The Bureau has, through its close contact with these groups, succeeded in halting the dissemination of much inaccurate medical information In many instances inaccurate information regarding medical matters has been corrected in the process of publication, while in other cases such inaccurate information has been eliminated completely through the advice and service offered by the Bureau

The Bureau has also worked closely with other bureaus and councils of the Association in matters pertaining to public relations and publicity The Bureau personnel on many occasions has served as consultants to medical groups seeking advice on publicity problems

All these activities have played a vital role in educating the American people as to the advancements of medical science and the services that physicians render for the benefit of mankind

## Bureau of Information

Establishment of the Bureau of Information in September 1944 had a twofold purpose. First, the Bureau was to survey through the state and county medical societies the medical personnel, medical facilities and medical needs of every county in the United States Secondly, with this information in hand the Bureau was to be of service to the returning medical officer in giving him pertinent facts which would help him in choosing an area in which he might establish his medical practice In that way the Bureau of Information hoped to be of service not only to the returning doctor but also to the country as a whole by bringing to needy areas more adequate medical care through a better distribution of physicians

During the year previous to V-J day a permanent card file for the 3,072 counties in the United States was prepared, giving important information concerning the medical, hospital, economic, financial, climatic, social and other conditions of the county Although over a year has elapsed since this survey was begun there are still more than 500 counties that have not responded to the request for information concerning their areas However, through the cooperation of most of the state medical societies and from the responses from individuals and communities, an extensive file has been built up of openings in specialties and general practice

Since several agencies of the Association, including the Committee on Postwar Medical Service, the Bureau of Information, the Council on Medical Education and Hospitals and the Bureau of Legal Medicine and Legislation, have taken part in the gathering of information, a bulletin was designed to combine and abstract that information which it was thought would be most desired by medical officers and to point out exactly how more specific and detailed data could be obtained This Information Bulletin for Medical Officers was published by the American Medical Association and sent to every physician in the armed services

Since V-J day the Bureau of Information has received about 565 letters a week from medical officers, and a weekly average of 110 physicians have come to the office for specific information regarding medical education, licensure and relocation One of the important objectives of the Bureau has been to assist the returning doctor to make a wise selection of a community in which to establish his practice Medical officers contacting the Bureau for information regarding opportunities in certain states are furnished with complete listings of the areas in the states where there is a need for a physician, together with county summary sheets for specific areas in which the physicians may be interested For further information regarding the establishment of a practice in certain areas they are referred to the secretaries of the county and state medical societies

Of the several thousand medical officers who have been interested in relocating, few are inclined to establish themselves in areas where there are inadequate hospital facilities or where the community may be financially unable to support a doctor Realizing that the needs of these areas must be carefully evaluated, the House of Delegates during its meeting in December 1945 suggested that each state medical society should be urged to establish an information service This state information office should at all times be in a position to furnish information concerning areas in need of physicians and a complete picture of the medical facilities and the physical and economic aspects of any community within the state. At the same time the Bureau of Information was established at the

American Medical Association on a permanent basis, and the Bureau was urged to provide advice or service to such state information offices relating to methods of organization and procedure In order to activate this program a committee composed of several state medical society secretaries was formed to act as an advisory council to the Bureau of Information and to help in drawing up directives to the state medical societies suggesting a course to follow in establishing these state information offices so that there would be a uniform system throughout the states

The Bureau of Information is working closely with the Council on Medical Service and Public Relations and the Committee on Rural Medical Service of the American Medical Association toward extending to all people in all communities the best possible medical care The Farm Bureau, the Farm Foundation and other farm groups are cooperating in every way with the Bureau in helping to attract physicians into areas where they are most needed In order to stimulate this activity in the states and to coordinate the work of the various groups working for better rural medical service, the Bureau assisted the Council on Medical Service and Public Relations and the Committee on Rural Medical Service in arranging a National Conference on Rural Health, which had its first meeting on March 30, 1946 in Chicago

### Committee on American Health Resorts

The Committee on American Health Resorts respectfully submits the following report for the year 1945

The Committee continued as in 1944 with only four members instead of five, Lieut Col Euclid M Smith was occupied with military duties but has now been returned to civilian life.

During the year the Committee continued to seek completion of the series of papers on spas and spa therapy Seven papers in this series were published in 1943 and seven in 1944 and are listed in the annual reports for those years One paper was published in 1945, entitled "Spa Therapy in Cardiovascular Conditions," by Carl R. Comstock. Two additional papers are to be published in 1946, entitled "Health Resort Therapy in Gastrointestinal Disorders," by Samuel Weiss, and "The Place of Health Resort Therapy in the Treatment of Dermatologic Conditions," by Anthony C Cipollaro Two papers in the series remain to be written, but the Committee has thus far been unsuccessful in finding an author for either one. They are entitled "The Value of Health Resort Treatment for Convalescence" and "The Place of Health Resort Therapy in the Treatment of Rheumatic Conditions" The publication of papers in this series in book form has been delayed because of paper shortages and lack of evidence of interest on the part of the medical profession.

The Committee met in January 1945 at the headquarters of the American Medical Association

The health resorts now listed by the Committee in compliance with its rules are the Torbett Clinic and Hospital, Marlin, Texas, and the Baker Hotel, Mineral Wells, Texas

A number of other resorts appear almost ready for listing, some of the difficulties having been ironed out, the principal one being the promotion and sale of bottled mineral waters with therapeutic claims

### Conclusion

All matters that have been referred to the Board of Trustees have received official consideration. The Board at this time reports progress in dealing with some and will continue to give them official attention until such time as final results can be submitted. It is probable that a supplementary report will be presented to the House of Delegates at San Francisco

Respectfully submitted,

R. L SENSENICH, Chairman

## ADDENDA TO REPORT OF BOARD OF TRUSTEES

### Report of the Committee on Scientific Research for 1945

During the year six applications were received and five new grants were made, amounting in all to $2,750 Seventeen grants were closed Work under twenty six earlier grants is in progress In several cases work has been delayed or suspended on account of the war

From an anonymous donor $500 has been received for the Brant Fund, which now contains $1,000 to be expended in support of medical research under the auspices of the committee.

The committee begs leave to recommend that annual provisions be made for the activities of the committee on about the same scale as before the war, that is, $12 550 for grants in aid of medical research and $1,200 for the expenses of the committee

The financial statement for 1945 is presented, also lists of grants pending and closed

Respectfully submitted

Term expires, 1946

FINANCIAL STATEMENT FOR 1945

| | | |
|---|---|---|
| Balance Jan 1 1945 | $24 146 16 | |
| Donation to Brant Fund | 500 00 | |
| Gift for scientific research in the field of cancer | 117 90 | |
| Refund grant 609 C E Cahn Bronner | 79 62 | |
| Refund grant 654 Reginald Fitz | 31 83 | |
| Refund grant 658 Meyer M Harris | 2 75 | |
| Refund grant 663 L. R Cerecedo | 3 21 | |
| Refund grant 686 H M Weaver | 2 60 | |
| | | $24 884 07 |

GRANTS AND EXPENSES PAID IN 1945

| | | |
|---|---|---|
| Grant 683 O Boyd Houchin | $ 350 00 | |
| Grant 687 Barnett Sure | 600 00 | |
| Grant 688 A R. Tunturi | 300 00 | |
| Grant 689 Israel S Kleiner and Arnold H Schein | 400 00 | |
| Grant 690 Leo L. Hardt | 250 00 | |
| Grant 691 D J Sandweiss T L. Patterson and H C Saltzstein | 1 200 00 | |
| Clerical expense | 615 04 | |
| | | $ 3 715 04 |
| Balance Dec. 31 1945 | | $21 169 03 |

### GRANTS OF COMMITTEE ON SCIENTIFIC RESEARCH

NEW GRANTS—1945

Grant 687 Barnett Sure Arkansas Agricultural Experiment Station Fayetteville $600 effect of sulfonamides on thiamine and riboflavin metabolism.

Grant 688 A. R Tunturi University of Oregon Medical School $300 effects of masking tones on the responses in the cerebral cortex to pulses of pure tones

Grant 689 Israel S Kleiner and Arnold H Schein New York Medical College $400 nutritive value of intact protein compared with the products of its enzymatic and acid hydrolysis

Grant 690 Leo L. Hardt Loyola University School of Medicine Chicago $250 improvements of flexi rigid gastroscope

Grant 691 David J Sandweiss Thomas L Patterson and Harry C Saltzstein $1,200 relation of the endocrine glands to gastric secretion

### STATE OF GRANT AIDED WORK

1 GRANTS CLOSED DURING THE YEAR

Grant 567 1940 Armand J Quick Marquette University $275 conversion of prothrombin to thrombin Quick A J Calcium in the Coagulation of Blood *Am J Physiol* **132**: 239 1941 The Prothrombin Concentration of Blood of Various Species *ibid* **132** 239 1941 Prothrombin Level of Blood After the Intramuscular Injection of Sodium Citrate *Proc Soc Exper Biol & Med* **47** 1 1941 Effect of Air Currents on Plasma Prothrombin *ibid* **50** 317 1942 On the Constitution of Prothrombin *Am J Physiol* **140** 212 1943 Experimentally Induced Changes in the Prothrombin Level of the Blood I. Quantitative Studies of Dogs Given Dicumarol II The Effect of Methylxanthines on Prothrombin Per Se and When Administered with Dicumarol *J Biol Chem* **161**: 33 1945

Grant 623 1942 Catharine Macfarlane Women s Medical College of Pennsylvania $2 500 value of periodic pelvic and breast examination in detecting cancer See grants 494 1938 536 1939 and 623 1942 Macfarlane Catharine Sturgis Margaret C and Fetterman Faith S The Value of Periodic Pelvic Examination in the Control of Cancer of the Uterus J A M A **126**: 877 1944 Results of a Cancer Control Research *M Woman s J* April 1945

Grant 644 1942 Jacob Rabinovitch Jewish Hospital Brooklyn $240 effect of heparin on thrombosis Rabinovitch Jacob and Pines Bernard The Effect of Heparin on Experimentally Produced Thrombosis *Surgery* **14** 669 1943

Grant 648 1942 Meyer M Harris New York State Psychiatric Hospital $250 further research on muscular disease See grant 658 1943 Harris Meyer M Studies Regarding a Glutamine like Substance in Blood and Spinal Fluid Including a Method for Its Quantitative Determination *J Clin Investigation* **22** 569 1943 Effect of Insulin Hypoglycemia and Glucose Administration on the Level of the Glutamine-like Substance in Blood Serum *ibid* p 577

Grant 668 1944 George Ulett University of Oregon Medical School $250 electroencephalograms in experimental focal brain lesions Ulett George Electroencephalogram of Dogs with Experimental Space Occupying Intracranial Lesions *Arch Neurol & Psychiat* **54**: 141 1945

Grant 672 1944 Archie R Tunturi University of Oregon Medical School $200 acoustic area in cortex of dog Tunturi Archie R Audio Frequency Localization in the Acoustic Cortex of the Dog *Am J Physiol* **141** 397 1944 Further Afferent Connections to the Acoustic Cortex of the Dog *ibid* **144** 389 1945

Grant 673, 1944 Leo Hardt Loyola University Medical School Chicago $300 new gastroscope. Hardt Leo L The Flexi Rigid Gastroscope *Gastroenterology* **3**: 508 1945

Grant 675 1944 Israel Davidsohn Mount Sinai Hospital Chicago $500 problems of Rh factor Wiener Alexander S Davidsohn I and Potter E L. Heredity of the Rh Blood Types II Observations on the Relation of Factor Rh to the Rh Blood Types *J Exper Med* **81** 63 1945 Davidsohn Israel Fetal Erythroblastosis J A M A **127**: 633 1945 Rh Antibodies *Am J Clin Path* **15** 95 1945

Grant 678 1944 Herbert S Kupperman University of Georgia $500 pregnancy test Kupperman Herbert S The Two Hour Pregnancy Test, submitted for publication in *Southern Medical Journal*

Grant 680 1944 Wilhelm Raab University of Vermont College of Medicine $500 protective effect of thiouracil against the toxic cardiovascular action of epinephrine and sympathin Raab Wilhelm Thiouracil Treatment of Angina Pectoris J A M A **128** 249 1945 Diminution of Epinephrine Sensitivity of the Normal Human Heart Through Thiouracil *J Lab & Clin Med* to be published

Grant 686 1944 H M Weaver Wayne University College of Medicine $280 production and treatment of alloxan diabetic coma in rats Refund $2 60 Friedgood Charles E. and Miller Arthur A Alloxan in Pregnant Rats *Proc Soc Exper Biol & Med* **59** 61 1945 Kaplan Nathan O Franks Maurice and Friedgood Charles E Metabolism in Diabetic Coma Produced by Alloxan *Science* **102** 447, 1945

2 WORK IN PROGRESS 1945

Grant 479 1937 Tracy J Putnam Boston City Hospital $200 injuries to the cervical portion of the cord. This research has been suspended for the duration

Grant 504 1938 Wallace M Yater Georgetown University Medical School $500 histopathology of bundle branch block.

Grants 518 1938 and 559 1939 Harold D West Meharry Medical College $150 synthesis of *dl* threonine

Grant 570 1940 William H Sweet University of Chicago, $300 course of nerve fiber tracts of the temporal lobe

Grant 582 1940 Charles W Greene Stanford University $500 physiology of the coronary system in monkeys Refund $160 48

Grant 584, 1940 Oscar V Batson University of Pennsylvania $200 nystagmus.

Grant 605 1941 Harry G Day Indiana University $400 physiologic significance of zinc. Active research suspended on account of war

Grant 607 1941 Fritz Levy Davis Memorial Hospital Elkins W Va, $250 study of marrow cells Levy Fritz Megakaryocytes and Blood Platelets, *Am J Clin Path* **15** 154, 1945

Grant 613 1941 Robert W Virtue University of Denver $200 formation of choleic acid [See grant 499 1938 report for 1940] Research suspended on account of war service

Grant 616 1941 Robert S Dow University of Oregon Medical School $250 effects of clotting in cerebral veins See grant 566 1940

Grant 626 1942 Peter P H de Bruyn University of Chicago $400 study of osteogenic substance in laying birds

Grant 650 1942 Tuberculosis Committee Minnesota State Medical Association J A. Myers chairman, $1,000 tuberculosis survey of Meeker County Minn

Grant 656 1943 Warren O Nelson Wayne University $300, lipids in the adrenal cortex Refund $133 08 See grant 481 1937

Grant 661, 1943 Roland K Meyer University of Wisconsin $500 antihormones McShan W H Wolfe Harold R and Meyer Roland K. Factors Affecting the Action of Antigonadotropic Sera in Immature Rats *Endocrinology* **33** 269 1943 Wolfe Harold R. Meyer Roland K and McShan W H The Negative Phase in the Antigonadotropic and Precipitin Productive Activities in Rabbits *J Immunol* **50** 349 1945

Grant 670 1944 Wilbur Thomas Bowman Gray School of Medicine $300 experimental cardiac rupture

Grant 671 1944 A M Lassek Medical College of State of South Carolina $1 000 effect of paralysis on human pyramidal system See grants 632, 1942 and 655 1943 Lassek A M The Human Pyramidal Tract X The Babinski Sign and Destruction of the Pyramidal Tract *Arch Neurol & Psychiat* **52** 484 1944 The Human Pyramidal Tract XI Correlation of the Babinski Sign and the Pyramidal Syndrome *ibid* **53** 375 1945 Lassek A M and Evans J P The Human Pyramidal Tract XII The Effect of Hemispherectomies on the Fiber Components of the Pyramids *J Comp Neurol* **83**: 113 1945

Grant 674 1944 David J Sandweiss and Thomas L Patterson Wayne University College of Medicine $750 relation of the endocrine glands to urogastrone. Kaulbersz, J Patterson T L Sandweiss D J and Saltzstein H C The Relation of Endocrine Glands to the Gastric Secretory Depressant in Urine (Urogastrone) *Science*, accepted for publication

Grant 676 1944 Frederick M Allen New York $500 studies on refrigeration surgery and treatment See grant 657, 1943 Allen Frederick M Spontaneous and Induced Epileptiform Attacks in Dogs in Relation to Fluid Balance and Kidney Function *Am J Psychiat* **102** 67 1945

Grant 677, 1944 J LeRoy Conel Harvard Medical School $500 post natal development of the human cerebral cortex (Charles A Brant Fund)

Grant 679 1944 Theodor E Bratrud University of Minnesota Medical School $600 colored illustrations for article on congenital adrenal hyperplasia

Grant 681 1944 W E Garrey Vanderbilt University School of Medicine $500 innervation of the heart of vertebrates

Grant 682 1944 Helen Ingleby Woman s Medical College of Penn sylvania $500 problems of cystic disease and carcinoma of the breast

Grant 683 1944 O Boyd Houchin Loyola University Medical School $350 vitamin E deficiency in relation to cardiac function

Grant 684 1944 Rachmiel Levine Michael Reese Hospital Chicago $1,000 secretion and metabolism of progesterone in threatened abortion

Grant 685 1944 Daniel J Glomset Des Moines Iowa $500 cardiac conduction See grant 629 1942 Glomset Daniel J and Birge Richard F A Morphologic Study of the Cardiac Conduction System IV The Anatomy of the Upper Part of the Ventricular Septum in Man *Am Heart J* **29** 526 1945

---

## Committee on Therapeutic Research

The Committee on Therapeutic Research, a standing committee of the Council on Pharmacy and Chemistry, encourages scientific investigations in the field of therapeutics by providing funds for the prosecution of necessary research

During the year 1945 the Committee issued twenty two new grants A detailed list of these grants, together with a list of publications during 1945 and of unexpected grants made before Jan 1, 1945, will be found in the appendix to this report

During 1945 the following grants were issued

Grant 536 C H Werkman professor of bacteriology Iowa State College of Agriculture and Mechanical Arts the mechanism of action of penicillin $1 000

Grant 537 Richard C deBodo associate professor of pharmacology New York University College of Medicine the antidiuretic action of some depressants of the central nervous system $500

Grant 538 Thomas H McGavack a sociate professor of medicine New York Medical College water balance under the influence of various hormones $200

Grant 539 Ward J MacNeal director of the Laboratories of Bacteriology New York Post Graduate Medical School and Hospital bacteriophage phenomena $1 000

Grant 540 Ward J MacNeal director of the Laboratories of Bacteriology New York Post-Graduate Medical School and Hospital experimental and clinical endocarditis $1 000

Grant 541 G L Cantoni assistant professor of physiology and pharmacology Long Island College of Medicine epinephrine $300

Grant 542 Woman s Medical College of Pennsylvania the use of penicillin therapy in intrinsic (bacterial) allergy with chronic infection of the sinuses $500

Grant 543 Harold D Green professor of physiology and pharmacology Wake Forest College Bowman Gray School of Medicine the influence of environmental temperature on ischemic compression shock $400

Grant 544 C H Werkman professor of bacteriology, Iowa State College of Agriculture and Mechanical Arts the mechanism of streptomycin action $1 000

Grant 545 Robert Chambers research professor of biology New York University College of Medicine, blood capillary fragility $500

Grant 546 Stuart Mudd, professor of bacteriology University of Pennsylvania School of Medicine the mode of action of the sulfonamides $1 000

Grant 547 L M N Bach Department of Physiology Tulane University of Louisiana School of Medicine the effect of certain hormones on the kidney tubules $150

Grant 548 Fred W Ellis assistant professor of pharmacology University of North Carolina Medical School the effect of some new synthetic spasmolytic agents $250

Grant 549 W F Hamilton professor of pharmacology and physiology University of Georgia School of Medicine significant blood pressure changes in unanesthetized animals $125

Grant 550 C A Handley and S A Peoples Department of Pharmacology and Physiology Baylor University College of Medicine water distribution of the body following the administration of digitalis $150

Grant 551 Victor Ross Department of Biochemistry Columbia University College of Physicians and Surgeons the preparation of a Schick toxin and a protamine precipitated tetanus toxoid $350

Grant 552 Leland C Wyman associate professor of physiology Boston University School of Medicine the factors controlling the growth and functional efficiency of transplanted adrenal cortical tissue $285

Grant 553 Adrian C Kuyper assistant professor of physiologic chemistry Wayne University College of Medicine a procedure for the detection and determination of unidentified plasma constituents $375

Grant 554 Thomas G Morrione assistant professor of bacteriology University of Vermont College of Medicine alterations in collagen content in experimental cirrhosis $350

Grant 555 Gladys Bucher associate in physiology Woman's Medical College of Pennsylvania pepsin in the urine $500

Grant 556 Robert L Jackson Department of Pediatrics State University of Iowa statistical evaluation and reporting of clinical research of immediate therapeutic value in the treatment of juvenile diabetes and of rheumatic fever $3 000

Grant 557 Lloyd D Seager professor of pharmacology Woman's Medical College of Pennsylvania the acute and chronic effects of the diamidines $500

The following is a list of the investigations conducted with the assistance of grants made by the Committee on Therapeutic Research reports of which were published during 1945

The Antidiuretic Action of Barbiturates (Phenobarbital Amytal and Pentobarbital) and the Mechanism Involved in This Action Richard C. de Bodo and K F Prescott *J Pharmacol & Exper Therap* **85**: 222 (Nov) 1945

Acute Toxicity of Choline Chloride Administered Orally to Rats Margaret W Neuman and Harold C Hodge *Proc Soc Exper Biol & Med* **58** 87 1945

Chronic Oral Toxicity of Choline Chloride in Rats Harold C Hodge *Proc Soc Exper Biol & Med* **58** 212 1945

On the Influence of Several Anesthetics on the Fatal Dose of Digitalis in Cats and Frogs Harold G O Holck Edwin L Smith and Robert H Shuler *J Am Pharm A* (Scientific Edition) **34** 90 (March) 1945

Blood Potassium and Histamine Intoxication in Relation to Adrenocortical Function in Rats Caroline Tum Suden Leland C Wyman and Matthew A. Derow *Am J Physiol* **144**: 102 (June) 1945

Stimulation and Depression of the Central Nervous System by Derivatives of Barbituric and Thiobarbituric Acids, P K Knoefel *J Pharmacol & Exper Therap* **84** 26 (May) 1945

Arrest and Repair in Experimental Endocarditis Lenta Ward J MacNeal Anne Blevins Marcello R Pacis and Alice E Slavkin *Am J Path* **21** 255 (March) 1945

Apparent Arrest of Staphylococcal Endocarditis Ward J MacNeal Charles A Poindexter and Frederick N Marty *Am Heart J* **29** 403 (March) 1945

Experimental Verrucous Endocarditis Ward J MacNeal *Science* **101**: 415 (April 20) 1945

Bacteriologic Studies in Endocarditis Ward J MacNeal and Anne Blevins *J Bact* **49**: 603 (June) 1945

Progress in the Study of Experimental Endocarditis Ward J MacNeal Anne Blevins Alice E Slavkin and Helen Scanlon *New York State J Med* **45**: 1440 (July 1) 1945

Experimental Carditis Ward J MacNeal Anne Blevins Alice E Slavkin and Helen Scanlon Proc *J Bact* **50**: 238 (Aug) 1945

Experimental Nephropathies IX A Summary of Experiments on Dogs James P Simonds and Opal E Hepler *Quart Bull Northwestern University M School* **19** 278 (winter quarter) 1945

Experimental Nephropathies I. A Method of Producing Controlled Selective Injury of Renal Units by Means of Chemical Agents James P Simonds and Opal E Hepler *Arch Path* **39**: 103 (Feb) 1945

Experimental Nephropathies II Renal Phosphatase After Poisoning with Mercury Bichloride Uranyl Nitrate and Potassium Dichromate Opal E Hepler Helen Gurley and James P Simonds *Arch Path* **39** 133 (March) 1945

Wound Healing An Experimental Study of Water Soluble Chlorophyll Derivatives in Conjunction with Various Antibacterial Agents Lawrence W Smith and Alfred E Livingston *Am J Surg* **47**: 30 (Jan) 1945

Some Difficulties Involved in the Prediction of the Stroke Volume from the Pulse Wave Velocity John W Remington W F Hamilton and Philip Dow *Am J Physiol* **144**: 536 (Sept) 1945

The Construction of a Theoretical Cardiac Ejection Curve from the Contour of the Aortic Pressure Pulse, John W Remington and W F Hamilton *Am J Physiol* **141**: 546 (Sept) 1945

The Relationship Between the Cardiac Ejection Curve and the Ballisto cardiographic Forces W F Hamilton Philip Dow and John W Remington *Am J Physiol* **144**: 557 (Sept) 1945

The Determination of the Propagation Velocity of the Arterial Pulse Wave W F Hamilton John W Remington and Philip Dow *Am J Physiol* **144**: 521 (Sept) 1945

Preparation of Pituitary Thyrotropic Hormone, Leon S Siereszko *J Biol Chem* **160** 585 (Oct) 1945

The War and Dermatophytosis with Special Reference to Treatment and Fungicide Testing Fred D Weidman Chester W Emmons Joseph G Hopkins and George M Lewis J A M A **128** 805 (July 14) 1945

The Effect of Ultraviolet Irradiation on the Toxicity and Chemotherapeutic Action of Stilbamadine Lloyd D Seager G R Wells and Gina Castelnuovo *Am J M Sc* **210** 134 (July) 1945

The Effects of Various Sulfonamide Drugs on the Electrocardiogram of the Dog Roberta Hafkesbring and Grace E Wertenberger *Fed Proc* March 1945

Assay of Pepsin in Human Urine Gladys R Bucher *Fed Proc* March 1945

The Isolation and Chemistry of Anterior Pituitary Hormones Influencing Growth and Metabolism Abraham White Monograph A A A S Science Press 1945

The Functional Pathology of Experimental Frostbite and the Prevention of Subsequent Gangrene K. Lange and L J Boyd *Surg Gynec & Obst* **80** 346 (April) 1945

The Functional Pathology of Frostbite and the Prevention of Gangrene in Experimental Animals and Humans Kurt Lange L G Boyd and L Loewe *Science* **102** 151 (Aug 10) 1945

The Functional Pathology of Experimental Frostbite and the Prevention of Subsequent Gangrene K Lange and L J Boyd *Bull New York Acad Med* **21** 441 (Aug) 1945

The following grants were issued before Jan 1 1945 In some cases the grant has expired and an unexpended balance remains, or the work is not yet completed or not yet published

Grant 232 George R Cowgill associate professor of physiologic chemistry Yale University School of Medicine the heart in vitamin B deficiency $250

Grant 297 Melvin Dresbach Harvard University School of Medicine the emetic effect of some of the digitalis bodies $250

Grant 306 Edwards A Park professor of pediatrics Johns Hopkins University School of Medicine rickets in the rat and the effect of solution of parathyroid on the circulation of the bone $75

Grant 408 Ephraim Shorr associate professor of medicine Cornell University Medical College the effect of progesterone on the vaginal smear $300

Grant 443 A. B Baker associate professor of neuropsychiatry and neuropathology and Raymond N Bieter professor of pharmacology University of Minnesota Medical School toxic effects of sulfanilamide and derivatives on nervous system and effect of vitamin B complex in prevention of such injuries $500

Grant 445 Paul L Day professor of physiologic chemistry and John R Trotter instructor in physiologic chemistry University of Arkansas School of Medicine ocular manifestations of tryptophan deficiency $300

Grant 449 Alrick B Hertzman professor of physiology St Louis University School of Medicine peripheral circulation $500

Grant 454 W L. Mendenhall professor of pharmacology and Albert J Plummer assistant professor of pharmacology Boston University School of Medicine the quantitative determination of theophylline $50

Grant 455 Frederick H Pratt professor of physiology and Marion A Reid instructor in physiology Boston University School of Medicine the effect of cardiac drugs on the denervated lymphatic hearts $100

Grant 458 George Fahr professor of internal medicine University of Minnesota School of Medicine the effects of lanatoside C on certain types of heart disease $100

Grant 459 Mary E O Sullivan Bellevue Hospital New York City the therapeutic effect of estradiol in muscular dystrophy $100

Grant 472 Robert V Brown professor of physiology and pharmacology University of North Dakota action of pilocarpine on bile secretion $150

Grant 474 Arthur C. DeGraff professor of therapeutics New York University College of Medicine the effectiveness of sodium thiosulfate and sodium formaldehyde sulfoxalate in treatment of cardiac arrhythmias induced experimentally by mercurial diuretics $400

Grant 478 Stacy R Mettier associate professor of medicine University of California Medical School the Rh factor in blood transfusion and other immunologic aspects of blood grouping $400

Grant 479 Mayo H Soley associate professor of medicine University of California Medical School treatment of patients with toxic diffuse goiter by means of radioactive iodine $350

Grant 483 Donald Slaughter professor of pharmacology and physiology Southwestern College of Medicine, the effects of sulfonamides on the regeneration of visual purple

Grant 484 Alfred Goerner associate professor of biologic chemistry Long Island College of Medicine and M Margaret Goerner pathologist, Brooklyn Thoracic Hospital the toxic action of carcinogenic compounds on liver tissue $400

Grant 488 L R Kaufman director of surgery New York Medical College circulatory competence of the intestine in cases of intestinal obstruction $125

Grant 489 L R. Kaufman director of surgery New York Medical College the use of enzyme mixture for dissolving slough $100

Grant 494 Amedeo S Marrazzi professor of pharmacology Wayne University College of Medicine to investigate sympathomimetic amines $500

Grant 498 Linn J Boyd, director of medicine and Kurt Lange clinical instructor in medicine New York Medical College the effect of cold in the treatment of shock, $300

Grant 499 Joseph Litwins clinical instructor in medicine New York Medical College the chemistry and hematology of blood donors $200

Grant 502 Julian P Maes Department of Pharmacology Dartmouth College the part played by the red blood corpuscle concentration of the systemic circulation in the maintenance of blood pressure at different levels of vasoconstrictor tone $150

Grant 505 James Orten assistant professor of physiologic chemistry Wayne University College of Medicine the relationship of dietary protein to porphyrin metabolism in the rat $250

Grant 506 *Andrew F Burton assistant professor of pharmacology* Howard University (1) the distribution of sulfanilamide in maternal and fetal tissues at various stages of pregnancy, (2) the toxic effects of quinine on the fetus in utero $600

Grant 512 Essie White Cohn associate professor of chemistry University of Denver the effect of sulfonamide drugs on the glycogen content of the liver of rabbits and rats $200

Grant 513 Ruth E Miller professor of bacteriology Woman's Medical College of Pennsylvania the relationship between immune mechanisms and bacterial respiration $412 50

Grant 514 Morton McCutcheon professor of pathology University of Pennsylvania School of Medicine the toxicity of sulfonamides and penicillin and the mechanism of chemotaxis in leukocytes $150

Grant 515 Harald G O Holck associate professor of pharmacology University of Nebraska School of Medicine the relationship of sex to drug action $200

Grant 516 Nellie Perry Watts Department of Pharmacology Woman's Medical College of Pennsylvania, methods to prolong the action of local anesthetic drugs $250

Grant 517 Harry Beckman professor of pharmacology Marquette University School of Medicine, avian malaria $250

Grant 524 Harry E Morton associate professor of bacteriology University of Pennsylvania School of Medicine necessity of bacteriostasis or bactericidal action to prevent infection in an animal body $100

Grant 525 Herbert Silvette assistant professor of pharmacology, University of Virginia Medical School the effect of low barometric pressures on kidneys previously damaged either surgically or by drugs $250

Grant 526 Walter G Crump Jr assistant professor of surgery New York Medical College and Herbert E Hollander assistant clinical professor of surgery City Hospital the enzyme factors in the transplantation of fetal or infantile pancreatic tissue in the adult recipient $200

Grant 527 Ralph G Janes assistant professor of anatomy Wayne University College of Medicine diabetes mellitus produced by alloxan and its modification by various experimental procedures $200

Grant 528 Linn J Boyd director of medicine and Kurt Lange clinical instructor in medicine New York Medical College capillary permeability of the meninges in meningitis and meningismus $350

Grant 529 Linn J Boyd director of medicine and Kurt Lange clinical instructor in medicine New York Medical College the effectiveness of physical therapeutic measures in peripheral vascular diseases $350

Grant 530 *Louis M Palermo assistant professor of surgery* and Boris Pollock clinical assistant in surgery New York Medical College omental grafts $200

Grant 531 Thomas H McGavick associate professor of medicine New York Medical College the absorption of compressed pellets of the steroid hormones $400

Grant 532 Thomas H McGavack associate professor of medicine New York Medical College and Herbert Elias New York Medical College inulin and diodrast clearances in endocrine diseases $250

Grant 533 Robert S Teague associate professor of physiology and pharmacology University of Alabama School of Medicine the metabolism of diethylstilbestrol and its derivatives with emphasis on the ratio of absorption distribution fate and excretion of these drugs $500

Grant 534 Stephen P Jewett New York Medical College the use of ammonium chloride in psychiatric disorders, $350

JOSIAH J MOORE Treasurer

## AUDITOR'S REPORT

January 29, 1946.

*To the Board of Trustees*
*American Medical Association*
*Chicago, Illinois*

*Dear Sirs*

We have examined the balance sheet of the American Medical Association, Chicago, Illinois as of December 31, 1945, and the statement of income for the year ended on that date, have reviewed the system of internal control and the accounting procedures of the Association and without making a detailed audit of the transactions, have examined or tested accounting records and other supporting evidence, by methods and to the extent we deemed appropriate except as hereinafter stated regarding confirmation of receivables and observation of the inventory taking

The cash and bank balances have been confirmed by count or by certificates from the depositaries The United States Government and other marketable securities were confirmed by an acknowledgment from the Continental Illinois National Bank and Trust Company of Chicago where the securities are held for safekeeping

We did not independently confirm the accounts receivable by communication with the debtors The accounts receivable were reviewed as to age and collectibility and, in our opinion the balances are fully realizable We reviewed the plan and system of control adopted for inventory taking but we did not observe the taking of the inventories nor did we make tests of the physical existence of the quantities recorded

Expenditures charged to property and equipment accounts during the year, in our opinion were properly capitalized as representing additions or improvements The provision for depreciation for the year appears to be adequate

We have received a letter from Messrs Loesch, Scofield, and Burke, attorneys for the Association, stating that the Supreme Court of Illinois has affirmed, in January 1946, the judgment of the Circuit Court that the Association is required to make contributions under the provisions of the Illinois Unemployment Contributions Act. The amount of the contributions payable by the Association for the period involved (1937 to date) is approximately $260,000 00, of which $37,000 00 is applicable to 1945, plus whatever interest and penalties may be imposed. The liability referred to has not been included in the accounts payable at December 31, 1945, and no charge in respect thereto has been made against the income of the period involved The management considers that the accounts reflect ample provision for the liability, in the Association Reserve and its related fund The attorneys state that no other litigation is pending against the Association

In our opinion, subject to the exceptions set forth in the preceding paragraphs, the accompanying balance sheet and related statement of income present fairly the position of the American Medical Association at December 31, 1945 and the results of the operations for the year based on the accounting procedures employed by the Association regarding which the following observations are submitted

(a) In accordance with the established practice of the Association the accounts as stated do not include (a) unrecorded assets in respect of accrued interest on bond investments, and membership dues unpaid, and (b) provision for accrued property taxes for the year 1945, and sundry unpaid bills and wages

(b) Subscriptions paid in advance are stated at an estimated amount which is based on cash received in December 1945, on account of 1946 subscriptions This procedure conforms to the method used in prior years

(c) Advance payments on publications include an estimated amount ($186 552 42) for prepaid subscriptions to Hygeia, and the amount ($118,933 83) received in advance for January 1946, advertising, directory information sales and service.

Fidelity insurance is carried against the undermentioned officers and employees in the amounts stated

| | |
|---|---|
| Dr Olin West, Secretary and General Manager | $10 000 00 |
| Dr Josiah J Moore, Treasurer | 10 000 00 |
| E A. Hoffman Cashier | 10 000 00 |
| J E Hartigan Assistant Cashier | 2 000 00 |

| Total Expenses of Councils Bureaus and Committees | $537 611 66 |

NOTE The above expenses are spread over the following Councils Bureaus and Committees as indicated Association Account $141 413 86 Bureau of Health Education $56 241 70 Council on Pharmacy and Chemistry $49 547 06 Chemical Laboratory $21 102 14 Council on Physical Medicine $24 261 78 Council on Foods $16 583 50 Committee on Therapeutic Research, $13 358 97 Council on Medical Education and Hospitals $60,948 84, Bureau of Legal Medicine and Legislation $33 145 67 Bureau of Investigation $9,164 90 Bureau of Medical Economics $6 309 26 Council on Industrial Health, $21 152.22, Association and Bureau of Exhibits $22 795 12 Council on Medical Service and Public Relations $50 342 97 Committee on Medical Preparedness $11 243 67

## REPORT OF THE COUNCIL ON MEDICAL EDUCATION AND HOSPITALS

*To the Members of the House of Delegates of the American Medical Association*

The major concerns of the Council on Medical Education and Hospitals during the past year have been with the future supply of premedical and medical students and with meeting the needs of returning medical officers desiring residencies

### THE SUPPLY OF PREMEDICAL AND MEDICAL STUDENTS

Since the cessation of deferment of premedical students in June 1944, the Council has bent every effort toward a modification of this policy Efforts in this direction were continued during the past year with the Army, Navy, Selective Service System and Congress In addition, the Secretary with others representing interested groups held a conference with President Truman on this subject. Throughout efforts to provide for the deferment of premedical students, the Council has had the cooperation of the Procurement and Assignment Service and the War Manpower Commisison No change in policy has resulted from these attempts to correct the situation. There still is no deferment of premedical students

As a result of these policies, the medical school classes entering in the year 1946 must be derived from veterans, physically disqualified males, women, and men under 18, besides the few medical students who are carried on other Selective Service deferments Undoubtedly the enrolment of women will increase and the returning veteran will supply considerable numbers of qualified premedical students However, the consensus is that the 1946 entering classes will be deficient either in numbers or in quality It is a little too early to predict exactly how the 1946 entering class will be affected, since most schools will not commence their next session until September or October 1946

### RESIDENCIES FOR RETURNING MEDICAL OFFICERS

The Council on Medical Education and Hospitals has received hundreds of letters a month from physician veterans and medical officers on active duty Most of the officers seek information on residencies in specialties, short term refresher courses, basic science instruction and other matters relating to the education of physician veterans under the G I Bill of Rights Numerous requests are received also with reference to specialty certification, requirements of the individual boards, educational credit for military service, opportunities for training in army, navy and veterans' hospitals, preceptorships and assistantships, affiliated hospital assignments, hospital quota allocations and deferment of residents and assistant residents under the 9-9-9 program of medical education Many seek information on hospital administration, medical licensure requirements, opportunities for staff appointments, organization of clinics, office plans, surplus equipment and supplies, financial aids in training and practice, suitable appointments for handicapped veterans and various other questions

These inquiries receive careful attention, and every effort is made to supply complete information to all medical officers In relation to educational opportunities, the Council provides lists of postgraduate continuation courses for veteran and civilian physicians, hospitals approved for internships, residencies and fellowships, and lists of vacancies reported in relation to individual specialties Since Oct. 18, 1945 the Council has conducted surveys to ascertain the number of vacancies available in approved hospitals for returning medical officers The Council is also continuing its efforts to establish additional high grade residency programs in hospitals that have not yet developed their educational service to full capacity Through these activities many new services are now in process of organization and may soon be added to the approved lists

As many as 200 medical officers have visited the Council's office each month, seeking in general the same type of information as requested in the letters already mentioned Among these men there is great interest in certification and specialty practice, although the older group, 35 to 40 or over, hesitate as a rule to undertake a long term residency program of three years to qualify for board certification. Many of these, however, are

hoping to obtain assistantships or preceptorships that combine both practice and education Some officers are undecided as to future training and practice and appreciate the assistance given through personal counseling Many of the officers are critical of their army service, and some are disappointed that educational appointments are not immediately available for residency or postgraduate training It is observed, however, that the great majority are applying at university hospitals or medical centers, where requests for training are already in excess of available facilities

The personal interviews have been exceedingly helpful in relation to these problems The medical officers appreciate the opportunity to express their views, and it is also possible in these contacts to explain more fully the work of the American Medical Association in connection with graduate and postgraduate medical education The value of these contacts is clearly evident, and every effort will be made to continue our assistance and personal service to the returning medical officer

The Council's efforts at stimulating hospitals to expand their residencies consistent with their educational resources and the maintenance of high standards has done much to meet the greatly increased demands for such training In the annual Hospital Number of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION published April 20, 1946 there is listed a total of 8,043 approved residency places in all fields This number is to be compared with that of 1941, when there were 5,256 places The total expansion is thus more than 50 per cent This still falls short of the estimated 100 per cent expansion required, but that goal is still being approached Some 2,000 residency places formerly occupied by assistant residents and residents are now being made available to physician veterans because of the discontinuing of the 9 9-9 program Efforts at increasing the residency offerings of approved hospitals are continuing, although there has been some evidence since March 1946 that the immediate acute demand is probably decreasing This evidence is based on the number of inquiries received by the Council from medical officers

### TEMPORARY APPROVAL OF RESIDENCIES

With the increased demand for residency training in recent months, large numbers of applications have been submitted by hospitals seeking Council approval of newly organized educational programs To make these facilities available to physician veterans without undue delay, the Council has instituted a plan for the temporary approval of such residencies as give satisfactory indication that training can be maintained in accordance with present standards The plan has been developed in collaboration with the Advisory Board for Medical Specialties and has been approved by nearly all the specialty boards

It should be noted that temporary approval is not automatic, each application will be carefully evaluated on the basis of information supplied as well as previous knowledge of the hospital service. Only if the representatives of the Council and of the Board are reasonably satisfied that the educational program fulfils the requirements for residency training will temporary approval be extended. The following procedure has been adopted

1 *The Council on Medical Education and Hospitals of the American Medical Association* has temporarily delegated to its Secretary the authority to grant temporary residency approval on behalf of the Council subject to concurrence by the appropriate American board as described in No 2

2 *Each participating American board has appointed representatives* (usually one individual for each board) to consider new residencies for temporary approval with authority to act on behalf of the board

3 Temporary approval will be based on information from the hospital concerning the personnel, facilities and educational program of the hospital service involved *without immediate inspection* Such approval will be granted only if the representatives of the Council and of the board are reasonably satisfied that the educational program fulfils the standards of both bodies

4 Subsequently employing the usual procedures an inspection of the hospital will be carried out by *the Council's staff On the basis* of inspection report the Council will consider the temporarily approved hospital for transfer to the regularly approved list in the usual manner The inspection report and the recommendations of the Council will be submitted to the appropriate board and the board will return its concurrence or disagreement with the Council The result of this procedure would be either (*a*) transfer of the temporarily approved residency to a fully approved status or (*b*) withdrawal of the temporary approval

5 In the event of withdrawal of temporary approval and failure to grant regular approval credit toward board certification will be given to physicians for that part of their training received while the residency was on a temporary approval status After such withdrawal of approval residents seeking board certification will be given a reasonable time to obtain another acceptable residency without loss of time credit This means that no resident would be penalized so far as board credit is concerned for time spent in a temporarily approved residency

In seeking approval by the Council on Medical Education and Hospitals, those hospitals which organize new residencies should initially make no distinction between regular versus temporary approval Applications should be transmitted to the Council in the regular manner In the immediate future most, if not all, applications will be considered at once for temporary approval The Council's staff will proceed with regular inspections as rapidly as possible, so that transfer of acceptable hospital residencies from the temporarily approved to the regular approved list will take place as rapidly as possible if the inspection report seems to warrant such transfer in the opinion of the representatives of the Council and of the American board concerned

The program of temporary approval of residencies has been approved by virtually all of the American boards in the various specialties and is operating smoothly and effectively Within two months of the proposal of this plan to the Advisory Board for Medical Specialties, in February 1946, there were 162 separate residency programs approved on this basis, besides over 200 individual residency places

### HOSPITAL RESIDENCIES UNDER THE G. I BILL OF RIGHTS

In collaboration with the Committee on Postwar Medical Service, the Council has been seeking and finally received a clarification from the Veterans Administration of the status of residency hospitals and of physician veterans receiving such residency training under the educational provisions of the G I Bill of Rights Important questions repeatedly raised have been *Is a hospital offering* an acceptable residency program eligible to participate? Are physician veterans eligible for subsistence benefits while pursuing such a course of study? May a veteran commence his residency training while on terminal leave? These questions have been answered in the affirmative with certain qualifications The details of such arrangements were published in THE JOURNAL Jan 26, 1946 Reprints of these regulations were sent to residency hospitals and to the state agencies appointed by the various governors for approving educational institutions desiring to participate under the G I Bill of Rights Reprints of this statement were also sent to each regional Veterans Office throughout the United States The dissemination of this information was carried out with the full endorsement of the central office of the Veterans Administration in Washington

A modification of the original G I Bill of Rights was passed in amendments which became law in December 1945 Certain of the changes had been advocated by the Council It is now not necessary for a physician veteran of any age to prove that his education was interrupted to become eligible, more satisfactory arrangements for tuition payments for short courses are provided tuition and subsistence benefits will not be charged against the veteran's bonus should one later be voted by Congress, and the subsistence benefits were increased

### GRADUATE CONTINUATION COURSES FOR VETERAN AND CIVILIAN PHYSICIANS

The Council has periodically published in THE JOURNAL lists of continuation courses of a review and refresher nature offered by educational institutions throughout the country to graduate physicians Recently such lists have been published semiannually In the listing published Dec. 8, 1945, courses offered Jan. 1 to July 16, 1946 were described. The listing was some 30 per cent longer than for the preceding six months period as a result of increasing facilities which were developed primarily for returning medical officers More important than mere numbers of courses is the fact that more of these courses are of longer duration, more are being offered by universities and medical schools and the geographic distribution is more extensive Such courses are being developed so rapidly and in such numbers that supplementary listings have had to be published by the

Council in the interim between regular publications. Such supplements were published in THE JOURNAL March 2, 1946 and March 23, 1946. The response of medical schools, hospitals, medical societies and other educational institutions throughout the country to the great demand for these educational opportunities has been most gratifying. On every hand there is a maximal attempt to provide the needed facilities.

### RECONVERSION OF THE 9-9-9 INTERNSHIP AND RESIDENCY PROGRAMS

The withdrawal of intern and residency quotas from all hospitals on April 1, 1946 as announced by the Procurement and Assignment Service marks the return of hospital educational services to a peacetime status. With this change as well as the return of medical officers to former staff positions, it may be anticipated that many hospitals will reorganize their educational programs for interns and residents, institute new residencies in various departments and reestablish those which remained inactive during the war because of quota limitations or reduction in teaching staff. When adequate clinical and teaching facilities are available such expansion will be of direct benefit to physician veterans, as it will lead to further opportunities for residency training.

In November 1945 the Procurement and Assignment Service announced its plan for the reconversion of the 9-9-9 program. Under this plan the commissioned officers scheduled to complete their nine months' internship on April 1 would be permitted to continue their training until July 1, 1946. It was stated, however, that if hospitals were unable to accommodate these men as well as the new interns appointed for April 1 the commissioned officers who completed their nine months of intern training would be called to active duty. A subsequent directive specified also that requests for extension of individual internships through the additional three months period would need to be submitted by February 1. Since one of the main purposes of the reconversion program was to reestablish the peacetime status of twelve months' internships beginning each July, the new interns appointed April 1, 1946 will be permitted to continue until July 1, 1947.

It was also the purpose of the reconversion plan to provide more residency positions for returning medical officers, and hospitals were urged to begin at once to appoint veterans to the house staff so that every military resident and assistant resident could be called to active duty on or before April 1, 1946. The discontinuance of deferments beyond the intern level has made available to veterans many additional places, and as time goes on an increasing number of positions will be filled by returned medical officers, who now constitute the primary source of supply for the future residency appointments.

### APPOINTMENT OF INTERNS

The following plan for the appointment of interns whose services will begin July 1, 1947 has been approved by a Joint Committee of the American Hospital Association, Association of American Medical Colleges, Council on Medical Education and Hospitals of the American Medical Association, American Protestant Hospital Association and Catholic Hospital Association of the United States and Canada. The plan applies only to July 1, 1947 appointments and will be modified for later internships. It provides that applications for internships should be submitted in accordance with the following principles:

1. Applications and credentials for internships to begin July 1, 1947 should not be released by the medical schools or received by the hospitals before June 1, 1946. Credentials include letters of recommendation, summaries of scholastic records from the dean's office, transcripts of records and recommendations of college faculties.
2. Hospitals should not issue appointments to interns either written or verbal before July 1, 1946.
3. The prospective intern's acceptance or rejection of such appointment shall reach the hospital on or before July 8, 1946.
4. Medical school teaching staffs will very carefully refrain from conversations with their clinical clerks which may be interpreted as promises of internship appointment.

It is strongly urged that all medical schools and hospitals act on the basis of the principles just described. The plan can be successful only if there is complete cooperation by all concerned.

The successful operation of this program should materially improve the manner of internship appointments providing intern applicants with the maximal opportunity for obtaining the most desirable internships and preventing unfair competition among hospitals in securing interns.

### HOSPITAL SERVICE IN THE UNITED STATES

The annual hospital report of the Council on Medical Education and Hospitals published in the April 20, 1946 issue of THE JOURNAL shows a continued increase of hospital service in 1945. The number of patients admitted was 16,257,402, or 220,544 more than reported in 1944. In addition there were 1,969,667 hospital births, a total unequaled in any previous year. The tremendous volume of hospital service in the United States is likewise reflected in the average census, or daily patient load, which reached a new high of 1,405,247. This average, measured over a period of one year, represents the unprecedented total of 512,915,155 treatment days. Included in the survey of 1945 are 6,511 registered hospitals, which have a combined capacity of 1,738,994 beds exclusive of 81,131 bassinets. While the number of beds represents a gain of 8,999 in the last year, the increase is small when compared with the rapid wartime expansion of 265,427 beds in 1943 and 80,691 in 1944.

The present report reflects only the early phase of peacetime readjustments in the hospital field. Changes are noted particularly in the federal hospitals, which show a reduction in number, in bed capacity and in total patients admitted. The latter were reduced by 239,322 in 1945, whereas an increase of 254,664 was reported in the previous year. Longer periods of hospitalization are now evident in the federal classification as well as an increased census, or daily patient load. The percentage bed occupancy increased sharply in 1945, as did also the average length of stay in the federal general hospital group. As in the previous war years, the statistical data on federal hospitals have been compiled as a unit report. It is not now possible, therefore, to supply separate information on federal groups except so far as individual hospital data are included in the registered list.

The general hospitals supply the greatest volume of hospital service, as evidenced by their report of 15,228,270 admissions, or 93.6 per cent of all patients admitted in 1945. They likewise gave care to 1,907,772 newborn infants, 96.8 per cent of the total live births in hospitals registered by the American Medical Association. Increases in general hospital admissions occurred in all governmental and nongovernmental groups except in the federal classification and in the hospitals listed as corporations unrestricted as to profit. The governmental general hospitals received 36 per cent of the total admissions, the nongovernmental general hospitals 57.6 per cent. In 1945 the average length of stay in general hospitals increased by two days, while the bed occupancy rate advanced from 61.6 to 72 per cent. These changes are largely the result of corresponding developments in the federal hospital group. In previous years the average census of the mental institutions exceeded the daily patient load reported by general hospitals. For the first time this trend has now been reversed, with a reported average of 665,105 in the general hospitals as compared with 624,349 in the mental hospital group. Considering the supply and utilization of hospital beds, it is of interest to note that the nonfederal general hospitals in relation to the estimated civilian population (U. S. Census Bureau, July 1, 1945) show a ratio of 3.5 beds per thousand, with an actual daily utilization of 2.6.

The governmental hospital group, which includes federal, state, county, municipal and city-county hospitals, has 78 per cent of the total hospital beds. They however received only 39 per cent of the admissions in 1945, whereas the nongovernmental hospitals, with 22 per cent of the beds, admitted nearly ten million patients, or 61 per cent.

### THE ACCELERATED PROGRAM IN MEDICAL SCHOOLS

Most if not all of the medical schools of this country will decelerate their educational programs in part or in toto commencing in 1946. All but four medical schools have returned to annual admissions. The plans for deceleration vary from institution to institution, with one or more of the upper classes continuing the accelerated program until graduation in some

instances To enable those schools desiring to do so to decelerate commencing in 1946 it was necessary that appropriate adjustments be made by the Army, the Navy and the Selective Service System, particularly in the case of those schools whose academic year ended in March 1946 and who desire to commence the next academic year six months later in the autumn of 1946 In the case of the Selective Service System it was necessary to obtain their permission, since certain medical students are still carrying occupational deferments Conferences with the Selective Service System resulted in its agreeing to a program involving a three months vacation and a three months special study period which students might carry out either in school or elsewhere. Consent for this was sought by the Council to enable those schools which wished to do so to free their educational facilities during the spring and summer in order to provide added educational opportunities for medical officers, particularly in clinical fields where the limitations of staff and material make it difficult for medical schools to provide training both to medical students and to graduate physicians

TERMINATION OF THE A. S. T AND V 12 PROGRAMS

By the close of the academic year in the medical schools in 1946 the Army Specialized Training and Navy V-12 programs were liquidated in our medical schools Most students have been discharged and are continuing in school as veterans, although the time spent by a student in one of these programs does not grant him credit for benefits under the educational provisions of the G I Bill of Rights

COLLABORATION OF MEDICAL SCHOOLS WITH VETERANS' HOSPITALS

The Veterans Administration has sought the collaboration of medical schools in the operation of various veterans' hospitals In this arrangement the medical schools will provide consultation service and assistance in formulating and carrying out educational programs at the residency level in veterans' hospitals A considerable number of medical schools are participating in this program Although this is a promising development, it is too early to assess the success which this project will enjoy

RESIDENCIES IN ARMY AND NAVY HOSPITALS

The Council has been collaborating with the office of the Surgeons General of the Army and Navy in the establishment of acceptable residency programs in army and navy hospitals The aim in setting up these programs has been to seek to improve the quality of medical care in these hospitals, to provide an incentive to medical officers to remain in the service and to supplement the work of civilian hospitals in providing educational opportunities for medical officers

HILL-BURTON HOSPITAL SURVEY AND CONSTRUCTION BILL (S. 191)

The Council on Medical Education and Hospitals has followed the direction of the Board of Trustees and the House of Delegates of the American Medical Association in its support of the Hill-Burton hospital survey and construction bill The Secretary of the Council appeared in support of the bill before the Senate Subcommittee on Education and Labor in February 1945 and before the House Subcommittee on Public Health of the Committee on Interstate and Foreign Commerce in March 1946 This measure has passed the senate with certain changes strengthening the authority of the Federal Hospital Council as recommended by the Secretary and another representative of the American Medical Association in the Senate hearings

NATIONAL SOCIETY FOR MEDICAL RESEARCH

At its meeting in December 1945 the House of Delegates endorsed support by the American Medical Association for measures to combat antivivisection propaganda and campaigns Subsequently there has been organized the National Society for Medical Research, with which the Council on Medical Education and Hospitals is collaborating The Secretary of the Council is a member of the executive committee of the board of directors of this national society Support for this organization is being sought from all interested organizations and institutions, including state and county medical societies A permanent office and secretariat is being organized. There is promise that this organization may accomplish much in the education of the public regarding the necessity and humane character of animal experimentation. The organization deserves wide support and will continue to have the full cooperation of the Council on Medical Education and Hospitals

ANNUAL CONGRESS ON MEDICAL EDUCATION AND LICENSURE 1946

In 1945 the forty-first Annual Congress on Medical Education and Licensure had to be canceled because of government restrictions on railroad travel and hotel reservations, although most of the papers prepared for presentation at this congress have been published in reprint form The forty-second Annual Congress on Medical Education and Licensure was held in Chicago in February 1946 under the auspices of the Council on Medical Education and Hospitals and the Federation of State Medical Boards, with which body the Council works in close collaboration Despite travel and hotel difficulties the attendance at this congress was approximately 300 Besides the formal meetings and presentation of papers, this session serves as the occasion for various joint meetings of organizations with common interests For example, the Council confers with the Federation of State Medical Boards, the National Board of Medical Examiners, the Association of American Medical Colleges and the Advisory Board for Medical Specialties The Council has met regularly in joint sessions with the latter organization to discuss the acute problems concerned with providing residencies for returning medical officers

LIAISON COMMITTEE OF THE COUNCIL AND THE ASSOCIATION OF AMERICAN MEDICAL COLLEGES

Some years ago the Board of Trustees of the American Medical Association authorized the establishment of a liaison committee of the Council on Medical Education and Hospitals and the Executive Council of the Association of American Medical Colleges Three or more meetings of this committee are held annually, enabling the Council and the Association of American Medical Colleges to advise on problems of mutual interest and to act jointly in matters pertaining to medical education Each body has been considerably strengthened by this arrangement. Inspections of medical schools are carried out jointly by the two organizations joint reports on inspections are issued and identical action is taken by the two groups in cases involving the status of a medical school

FOREIGN CREDENTIALS OF MEDICAL STUDENTS AND PHYSICIANS

The Council on Medical Education and Hospitals has always limited its consideration of medical schools for inclusion on its lists of approved institutions to the schools in Canada and the United States, so that foreign credentials otherwise must be evaluated by institutions and licensing authorities themselves as the occasion arises In connection with the Association of American Medical Colleges the Council has adopted the following recommendations to medical schools regarding foreign applicants desiring admission to schools in this country either with or without advanced standing

When an approved medical school wishes to consider an application from a student presenting credentials from a foreign university for admission with or without advanced standing the following uniform procedures are recommended

1 That only credentials sent directly from the foreign school to the American school be considered

2 That the applicant meet the admission requirements of the school to which he is applying and that his credentials be evaluated preferably by examination by the faculty of the arts college who appraise transcripts of records or by the usual agency of the medical school

3 That medical school subjects be evaluated preferably by examination, by professors who teach those subjects in the medical school to determine the competence of the applicant in those fields

4 That not more than two years of medical credit be allowed for work done in a foreign school

5 That the candidate be advised that meeting these requirements and graduation be no assurance that he will be eligible for licensure in the United States

6 That applicants from a foreign university for the freshman class be requested to take one year of premedical work in an approved American college of liberal arts before being given consideration for the study of medicine.

Efforts have been begun by the Council, the Advisory Board for Medical Specialties and the National Board of Medical Examiners to explore the possibilities for establishing some kind of approved listing of foreign medical schools

### JOINT MEETINGS WITH THE COUNCIL ON INDUSTRIAL HEALTH

The Council on Medical Education and Hospitals has met on several occasions with the Council on Industrial Health to discuss ways and means of developing and improving educational facilities for training in industrial health

### NEW MEDICAL SCHOOLS

The University of Washington, which has an appropriation of $450,000 for the medical and dental schools until March 31, 1947 and $3,750,000 for construction of the plant, including a hospital, has secured the services of Dr Edward Turner as full time dean Dr Turner was formerly president of Meharry Medical College

In California the regents of the University of California have authorized the establishment of a medical school at the University of California at Los Angeles The state legislature has appropriated seven million dollars for building and equipment Dr Verne O Knudsen, dean of the Graduate Division, has been appointed chairman of a committee, one of whose duties is to determine the location of the institution The question at issue is whether the medical school should be located on the present campus, which is in Westwood Hills about 12 miles west of the center of Los Angeles, or near the hospitals in Hollywood or Los Angeles

Every basic science school now operating under state auspices (Mississippi, Missouri, North Carolina, North Dakota, South Dakota and West Virginia) is contemplating expansion to the four year status All of them have at least authorized surveys of the problem, some of which have been completed

The state of Connecticut is also seriously considering the establishment of a four year medical school

Unfortunately, some of the current proposals for establishing new medical schools are ill conceived and rest on a failure to understand certain well recognized principles which must guide the thinking about such projects Some of these considerations, which would seem to be axiomatic, but too often disregarded, are as follows

1 There is no justification for the establishment of a medical school to meet such an acute temporary emergency as the absence of physicians on military duty

2 Any overall increased present or postwar need for additional physicians occasioned by the war can be provided by existing approved schools There is no justification for establishing new medical schools for this purpose Furthermore, the normal annual number of graduates from existing schools is adequate for the peacetime needs of the country, granted distribution is equitable.

3 The maldistribution of physicians as between the states or between urban centers and rural areas is a problem to be attacked primarily by other means than the production of more doctors in a given state, the rate of production and the distribution of doctors in this country are independent

4 Medical education is by far the most expensive form of professional training, requiring an initial outlay and subsequent annual budgets in the early years totaling millions of dollars and not tens or hundreds of thousands A school whose resources include annual budgets of less than $350,000, independent of the cost of maintenance of the hospital and outpatient departments, is unlikely to conduct a satisfactory program

5 The operation of an acceptable four year medical school is far more expensive than the conduct of a basic science medical program.

6 The trend toward more full time clinical instructors is so general that any new school commencing with all or nearly all of its staff on a part time basis is already obsolete

7 The possession of the M D degree and the successful practice of medicine do not, in themselves, indicate that a physician is qualified to teach medical students satisfactorily, even in clinical subjects Volunteer and part time teachers require special training and experience.

8 A hospital well equipped to provide medical care to the people or even satisfactory for internship or residency training is not thereby necessarily satisfactory as a medical school hospital

9 Medical schools must be so located that there is an ample supply of patients of all kinds, on the one hand, and competent instructors, including specialists, on the other hand

10 No medical school is worthy of the name which does not carry out some significant research, even though the primary aim of the school is the training of general practitioners

A failure to observe these generalizations might lead to costly ventures without prospects of accomplishing the ends sought, however desirable those ends may be.

### MEDICAL SCHOOLS VISITED DURING THE CALENDAR YEAR 1945

During the calendar year 1945 the following medical schools were visited for consultation, survey or other purposes

Wayne University College of Medicine
University of Minnesota Medical School
University of Buffalo School of Medicine
Hahnemann Medical College and Hospital
Meharry Medical College
University of North Carolina School of Medicine
University of Montreal Faculty of Medicine
Washington University School of Medicine
Essex College of Medicine and Surgery

On the basis of survey findings at the Hahnemann Medical College, that institution was placed on probation by the Council in June 1945 The official status of other schools has remained unchanged during the year 1945

At the request of the Insular Government and the University of Puerto Rico, the Secretary of the Council on Medical Education and Hospitals conducted a three week survey of medical care in Puerto Rico During this survey special consideration was given to the problem of the feasibility and advisability of establishing a four year medical school in Puerto Rico under the direction of the University of Puerto Rico

### INSPECTION OF HOSPITALS AND TECHNICAL SCHOOLS

Table 1 summarizes the inspection of hospitals and technical schools made by the Council during the calendar year 1945

TABLE 1.—*Inspection of Hospitals and Technical Schools During 1945*

| | |
|---|---|
| Hospitals | |
| Intern training | 11 |
| Residencies and fellowships | 109 |
| Intern training and residencies | 1 |
| Registration | 14 |
| Total | 135 |
| Individual Residencies and Fellowships Investigated | 337 |
| Technical Schools | |
| Clinical laboratory schools | 3 |
| Physical therapy schools | 7 |
| Occupational therapy schools | 1 |
| Total | 11 |

### SUMMARY OF REGISTERED HOSPITALS AND TECHNICAL SCHOOLS

In Table 2 are summarized the figures for approved hospitals and technical schools with changes occurring during the calendar year 1945

TABLE 2.—*Registered Hospitals and Technical Schools*

| | |
|---|---|
| Registration of Hospitals | |
| Hospitals registered Jan 1 1945 | 6 705 |
| New institutions registered during 1945 | 113 |
| Closed or transferred to unclassified file | 260 |
| Hospitals registered Dec 31 1945 | 6,558 |
| Internship Approval | |
| Hospitals approved for intern training Jan 1, 1945 | 777 |
| Approved during year | 19 |
| Removed from approved list | 2 |
| Hospitals approved for intern training Dec 31 1945 | 794 |
| Residency Approval | |
| Hospitals approved for residency training Jan 1 1945 | 776 |
| Approved during year | 61 |
| Removed from approved list | 54 |
| Hospitals approved for residency training Dec. 31, 1945 | 783 |

| | |
|---|---|
| Clinical Laboratory Schools | |
| Approved schools Jan 1 1945 | 253 |
| Approved during year | 16 |
| Removed from approved list | 3 |
| Approved schools Dec. 31, 1945 | 266 |
| Physical Therapy Schools | |
| Approved schools Jan 1 1945 | 31 |
| Approved during year | 2 |
| Removed from approved list | 10 |
| Approved schools Dec 31, 1945 | 23 |
| Occupational Therapy Schools | |
| Approved schools Jan 1 1945 | 17 |
| Approved during year | 1 |
| Removed from approved list | None |
| Approved schools, Dec 31 1945 | 18 |
| Medical Record Librarian Schools | |
| Approved schools, Jan 1 1945 | 10 |
| Approved during year | None |
| Removed from approved list | None |
| Approved schools, Dec. 31 1945 | 10 |
| X Ray Schools | |
| Approved schools, Jan 1, 1945 | 112 |
| Approved during year | 17 |
| Removed from approved list | None |
| Approved schools, Dec 31 1945 | 129 |

### COUNCIL PUBLICATIONS

Regular publications of the Council during the year 1945 include the following

Hospital Service in the United States
State Board Number of THE JOURNAL
Medical Education in the United States
Compilation of special reprint edition of papers prepared for the 1945 Annual Congress on Medical Education and Licensure
Postgraduate Continuation Courses for Veteran and Civilian Physicians
Approved Internships
Approved Residencies and Fellowships in the Specialties
Hospital Residencies and the G I Bill of Rights
Postwar Graduate Medical Education
Choice of A Medical School
Approved Colleges of Arts and Sciences
Schools for Clinical Laboratory Technicians
Schools for Physical Therapy Technicians
Schools for Occupational Therapy
Schools for Medical Record Librarians
Schools for X Ray Technicians

In addition, the Council publishes statements in THE JOURNAL from time to time concerning problems which arise. These may be considerable in number For example, in the first four months of 1946 there were twenty-seven separate statements or articles from Council sources in THE JOURNAL

### APPOINTMENT OF DR FRODE JENSEN

Dr Frode Jensen has now joined the staff of the Council, working primarily in the hospital division in connection with surveys of internship and residency hospitals. Dr Jensen received his M D degree from Columbia University College of Physicians and Surgeons in 1933 After a two year internship at Presbyterian Hospital, New York, he was a Fellow in Pathology at Syracuse University College of Medicine for one year and became extramural resident and instructor in medicine at the University Hospital in Syracuse. Studies carried out in the latter capacity were published jointly with Dr Herman G Weiskotten in the book entitled "Medical Care of the Discharged Hospital Patient." Dr Jensen has just completed three years of army service mainly in hospitals on the European continent and in England.

### ASPHYXIAL ACCIDENTS

In December 1945 the House of Delegates passed a resolution concerning asphyxial accidents and recommended that the Council on Medical Education and Hospitals send reprints of the survey report by the Council on Physical Medicine published in THE JOURNAL, Oct 6, 1945 to the heads of physiology, surgery and obstetric departments of approved medical schools as well as to hospitals approved for internship and residency training These instructions by the House of Delegates have been carried out by the Council

### COLLABORATION WITH OTHER AGENCIES

In the course of the year 1945 the Council has continued to collaborate with numerous other agencies in the field of health and education as well as with various governmental agencies These organizations and agencies are as follows

Association of American Medical Colleges
American Boards in the Specialties
Advisory Board for Medical Specialties
American Council on Education
American College of Surgeons
American Hospital Association
Committee on Postwar Medical Service
Federation of State Medical Boards
Farm Foundation
United States Office of Education
New York State Education Department
Procurement and Assignment Service
National Foundation for Infantile Paralysis
Institute of International Education
Office of Inter American Affairs
State Department
Pan American Sanitary Bureau
American Dental Association
National Nursing Council
National League of Nursing Education
National Organization of Public Health Nursing
National Association of Practical Nurse Education
Joint Orthopedic Nursing Advisory Service
North Carolina Medical Care Commission
North Central Medical Conference
Veterans Administration
Selective Service System
National Board of Medical Examiners
War Department
Bureau of Medicine and Surgery (Navy)
Puerto Rico Medical Association
United States Public Health Service
Citizens Federal Committee on Education
Regional Meetings Council on Medical Service and Public Relations
Tri State Hospital Assembly
Catholic Hospital Association
American Farm Bureau Federation
Office of Vocational Rehabilitation
American College of Hospital Administrators
American Trudeau Society
American Public Health Association
American Red Cross
American Physiotherapy Association
American Registry of Physical Therapy Technicians
American Congress of Physical Medicine
American Occupational Therapy Association
American Society of Clinical Pathologists
American Association of Medical Record Librarians
American College of Radiology
American Registry of X Ray Technicians
Board of Registry of Medical Technologists

These conjoint activities have been varied in nature and have involved the Secretary, the other members of the staff of the Council as well as members of the Council itself In most instances these cooperative enterprizes have involved participation in conferences, advisory committees and joint sessions.

### THE RETIREMENT OF DR. OLIN WEST

The Council learned with regret of the retirement of Dr Olin West as the Secretary and General Manager of the American Medical Association In fulfilling the many duties of these offices through the years Dr West has always lent his strongest support to the Council in its work. He has sought at every turn to strengthen the Council, particularly through improvements in the Council's staff and office personnel The Council hopes that Dr West's interest in medical education will continue and that the benefits of his wise counsel will be made as freely available as has been the case in the past

With the retirement of Dr West and the appointment of Dr George F Lull, the Council wishes to express its desire to cooperate fully with the new executive officer of the American Medical Association.

### APPRECIATION

In carrying out its work, the Council and its staff have enjoyed the fullest cooperation of every one concerned in efforts to maintain and improve adequate educational standards in all fields pertaining to medicine. This has involved not only the agencies mentioned in the report but officers and officials of medical schools, hospitals, licensing boards and technical schools The readiness of these bodies in supplying information and data for the special numbers of THE JOURNAL is greatly appreciated by the Council Such information is widely used by government bodies, hospitals, medical schools, medical students and physicians The Council is especially grateful to the officers,

trustees and members of the House of Delegates of the American Medical Association for the support and cooperation given to the Council in its every activity throughout the past year

Respectfully submitted,

RAY LYMAN WILBUR, Chairman,
J. H. MUSSER,
HARVEY B. STONE,
REGINALD FITZ,
RUSSELL L. HADEN,
CHARLES GORDON HEYD,
H. G. WEISKOTTEN,
VICTOR JOHNSON, Secretary

## REPORT OF THE COUNCIL ON SCIENTIFIC ASSEMBLY

*To the Members of the House of Delegates of the American Medical Association*

During the past year the Council on Scientific Assembly had one meeting. This was held on Dec. 1, 1945 in conjunction with the Annual Conference of Section Secretaries.

Section Meetings. The following schedule for section meetings for the 1946 session of the Scientific Assembly was approved:

MORNING SECTION MEETINGS

Pediatrics
Surgery: General and Abdominal
Ophthalmology
Experimental Medicine and Therapeutics
Nervous and Mental Diseases
Dermatology and Syphilology
Gastro-Enterology and Proctology
Radiology
General Practice of Medicine

AFTERNOON SECTION MEETINGS

Internal Medicine
Obstetrics and Gynecology
Laryngology, Otology and Rhinology
Pathology and Physiology
Orthopedic Surgery
Urology
Preventive and Industrial Medicine and Public Health
Anesthesiology

The Council considered a proposal that a Session on Aviation Medicine be held in the Section on Miscellaneous Topics in 1946 but was of the opinion that it is not necessary to have such a session in view of the fact that the Section on Pathology and Physiology is planning to devote one of its meetings to that subject.

General Scientific Meetings. A number of significant topics for possible discussion on the General Scientific Meetings program were studied by the Council. The Chairman was instructed to prepare a tentative program and submit it to each member of the Council for approval. Eighteen topics were deemed of sufficient importance to warrant a place on the program. Nationally known authorities have been invited to present papers on these selected topics.

Section on General Practice of Medicine. The recommendation of the Council that a new section for general practitioners be established was approved by the House of Delegates. A Chairman and a Secretary for the Section on General Practice of Medicine were appointed by the Council, and these officers have arranged a program for the San Francisco Session.

New Member of Council. Dr. Henry Viets of Boston was nominated for membership on the Council on Scientific Assembly, and the nomination was confirmed by the House of Delegates at its meeting in December 1945.

Respectfully submitted,

EDWARD L. BORTZ, Chairman
FREDERICK A. COLLER.
CLYDE L. CUMMER
CHARLES H. PHIFER
HENRY R. VIETS

H. H. SHOULDERS, President-Elect
MORRIS FISHBEIN, Editor, THE JOURNAL.
GEORGE F. LULL, Secretary
} Ex officio

## REPORT OF COUNCIL ON MEDICAL SERVICE AND PUBLIC RELATIONS

*To the Members of the House of Delegates of the American Medical Association*

During the months following the meeting of the House of Delegates held Dec. 3 to 5, 1945 the Council on Medical Service and Public Relations has made progress on the projects referred to it by the House of Delegates and has continued with its original functions as set forth at prior meetings of the House.

PREPAYMENT MEDICAL CARE PROGRAM

One of the principal demands at the 1945 meeting of the House of Delegates was the institution of a plan for the prepayment of medical care. Resolutions submitted in a supplementary report of the Council on Medical Service and Public Relations were as follows:

*Resolved* That the House of Delegates take immediate steps to encourage the development of a national voluntary prepayment medical care plan for the purpose of covering areas not now served by plans for the purpose of assisting in the enrolment in local plans of national enrolment groups and to serve until such time as all states have their own plans and be it further

*Resolved* That the American Medical Association's Council on Medical Service and Public Relations be instructed by the House of Delegates to take immediate steps to

1. Coordinate the activities of all prepayment medical care plans now in operation
2. Foster the development of such plans where there are none
3. Educate physicians and the public as to the functions of voluntary prepayment plans and the need for supporting them and be it further

*Resolved* That the officers and committees of every state medical society be urged by the House of Delegates to secure prompt action by their state societies in inaugurating new or increasing the benefits of existing prepayment medical care programs in every state

*The Reference Committee on Legislation and Public Relations, to* which these resolutions were referred, reported back the following to the House and the report of the reference committee was adopted:

Your reference committee has reviewed several resolutions calling for the adoption of voluntary prepayment medical care plans. All of these plans show a uniformity of desire for the immediate setting up of a national plan on a voluntary basis. In all of them the urgency of this being done is stressed. Accordingly your reference committee recommends that the House of Delegates of the American Medical Association instruct the Board of Trustees and the Council on Medical Service and Public Relations to proceed as promptly as possible with the development of a specific national health program with emphasis on the nationwide organization of locally administered prepayment medical plans sponsored by medical societies.

In accordance with these instructions the Council proceeded with the formulation of a specific program on prepayment medical care plans. In proceeding with this the Council first called together its Advisory Committee on Prepayment Medical Care Plans with a request that an overall program be suggested. The suggestions of the Advisory Committee, considered by the executive committee and discussed with the Executive Committee of the Board of Trustees, follow:

*Part I*

To activate this program it is recommended that steps be taken by the Council on Medical Service and Public Relations to obtain the cooperation of all the existing prepayment medical care plans for the purpose of coordinating their activities and to obtain information, data and statistics and to make the Council on Medical Service and Public Relations a central source of information and the spokesman regarding the prepayment medical plan movement.

We recommend that the following steps be taken:

(*a*) A letter to the plans now in operation explaining the program of the Council and asking for specific information and data as a preliminary report, and requesting suggestions as to future regular reports.

(*b*) Release of a monthly news letter on prepayment plans activities to which all plans be invited to submit news items and articles. The establishment of a page or more as necessary in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION to set forth pertinent and interesting information of the prepayment medical plans.

(*c*) The establishment of a public relations and press division of the Council on Medical Service and Public Relations to supply the national press with specific items and stories concerning the various plans for prepayment care both on national and on local levels to prepare literature speeches etc. for representatives on the Council.

(*d*) Publication of an official roster of medical society sponsored and approved plans including pertinent information on each.

(*e*) The adoption of a common symbol or trade mark for the use of the medical societies sponsored and approved plans.

(*f*) The establishment of an Advisory Service within the Council on Medical Service and Public Relations to provide speakers and technical advisers in relation to matters of organization and administration for county and state medical societies in the formation of plans such speakers and advisers to be designated by the Council on Medical Service and Public Relations.

(*g*) To develop and recommend means for local medical care plans to cooperate with the Veterans Administration to provide care for veterans

with service connected disabilities and such other care as they may be entitled to on the basis either of prepayment or of cost plus arrangements to the end that the veteran may have free choice of physician in his home community

(*h*) To encourage and assist local plans in development of arrangements for care of indigents and others entitled to public assistance to provide adequate care of good quality for such persons with free choice of physician

*Part II The National Program*

It is recommended that the Council on Medical Service and Public Relations be authorized to proceed immediately with the organization of a nonprofit corporation under the applicable statutes of the state of Illinois.

The Holding Corporation

1 The name shall be National Voluntary Health Association

2 The purposes

(*a*) To promote through education better health for all

(*b*) To promote a greater availability of health facilities

(*c*) To provide methods of easier and more convenient payment for health services by encouraging organization of voluntary prepayment health care plans

(*d*) To raise funds for to support to invest in any and all activities organizations or efforts with similar purposes whose objectives are related to the improvement of health services or their distribution to or acquisition by the public.

Profits which may be derived from investments or funds received from any other source shall be utilized for the purpose of the National Voluntary Health Association as set forth under *a b* and *c* and no dividends shall be paid or shall redound to the benefit of any member of the Association

Membership of the Corporation

It is proposed that if statutes permit the membership of the Corporation shall consist of the persons who are members of the Board of Trustees of the American Medical Association or of the Council on Medical Service and Public Relations of the American Medical Association while serving in such capacities and such other persons as these members may elect to membership.

Board of Directors

The Board of Directors shall consist of not less than and not more than members to be elected by the membership It is recommended that membership of the Board of Directors be classified The Board of Directors shall have the authority and responsibility for directing the actions of the Corporation The Board may delegate authority and duties to such committees which they may appoint in accordance with the By laws

Finances

It is recommended that the Corporation be financed by contributions from the American Medical Association state medical societies component county medical societies prepayment medical care plans individual doctors of medicine and other acceptable sources It is further recommended that at least $500 000 be secured to activate these proposals immediately

The Service Corporation

It is further recommended that the National Voluntary Health Association proceed with the immediate organization of National Medical Insurance Inc. a casualty insurance corporation under the laws of the state of Illinois, to operate a health and accident insurance business under class II of the Illinois Insurance Statutes

It is recommended that all of the stock be held by the National Voluntary Health Association except necessary directors qualifying shares

The authorized and paid in capital shall be $200 000.

The surplus should be $300 000 and shall be not less than $200 000

(In both instances the funds to be provided by the National Voluntary Health Association No commission or organization expense will be paid on issuance of the capital stock)

Articles shall provide for a Board of Directors of not less than three nor more than twenty one of whom three must be residents of Illinois (Meetings may be held within or without the state)

It is recommended that the Corporation secure licenses to transact business in all states and territories where necessary (No effort will be made if the state medical association objects)

There is precedent to show that licenses can be secured in these states without long waiting periods It is the considered opinion of the Advisory Committee that the organization of a national medical care insurance company and its licensure in the necessary states presents no more difficult or expensive problem than would be the acquisition of any existing available charter

(It is contemplated that National Medical Insurance Inc and provisions should be set forth in its by laws to assure that it will not operate in competition with locally sponsored medical plans that in localities where plans are organized subsequent to its admission it will withdraw in favor of such local plans)

On the recommendation of the Executive Committee of the Board of Trustees, copies of the suggestions were forwarded to all members of the Board of Trustees and the Council for preliminary study prior to a full meeting of both groups It became evident that a difference of opinion existed as to the exact meaning of the House of Delegates resolutions Some were of the opinion that they allowed the formation of a national insurance company, others felt that the resolution did not give the Council or the Board of Trustees the right to form such a company

In February the Council met and heard evidence for and against the suggestions from plan directors At the same time fifty-two representatives of various medical care plans met at American Medical Association headquarters to discuss the suggestions of the Advisory Committee and reorganize the Medical Service Plans Council of America into a functioning body The plan managers present were of the opinion that part I of the Advisory Committee's suggestions should be activated immediately through close cooperation between the new organization of prepayment medical care plans, called Associated Medical Care Plans, and the Council on Medical Service and Public Relations, and that part II of the Advisory Committee's suggestions could best be accomplished through coordination of existing plans rather than the formation of an overall organization

*Recommendations to the Board of Trustees*

On the basis of the evidence heard and information available, the following statement was prepared for the joint meeting of the Council and the Board of Trustees held on April 14

The Council on Medical Service and Public Relations recommends the employment of a Director of its Division on Prepayment Medical Care Plans and the necessary staff It also is recommended that the Council appoint an advisory committee representing medical care plans and their associates

The Council has determined standards for medical care plans a copy of which is attached Plans which meet these standards shall be entitled to the use of the Council Seal during the period of their approval

The Director of the Division of Prepayment Medical Care Plans of the Council on Medical Service and Public Relations with his staff and with the assistance and cooperation of the Advisory Committee the state medical societies and Associated Medical Care Plans Inc. shall be available to assist in developing plans increasing the number of persons covered by already existing plans and facilitating reciprocity among them

The Council believes that responsibility for the development of medical care plans rests with state and county medical societies Stimulation coordination and the federation of such plans under the instructions of the House of Delegates is deemed to be the function of the Council on Medical Service and Public Relations and the Board of Trustees of the American Medical Association.

The duty of the Advisory Committee shall be to advise the Director of Prepayment Medical Care Plans and the Council on the methods of implementing the program and on approval of the Council the Director of Prepayment Medical Care Plans will undertake the functions described in paragraph 3

The Advisory Committee shall consist of five members appointed for one year For the first year it is suggested that the following comprise the committee Mr Jay Ketchum Dr F L Feierabend Dr Herbert Bauckus Mr William Bowman and Mr Charles Crownhart

A tentative cost of this program is estimated at $50 000 for the first year

The Council also brought to the attention of the Board of Trustees the proposals suggested by the Advisory Committee which had originally been made to the Executive Committee of the Board on January 11 These are included in part I of this section of the report.

With reference to part II of the Advisory Committee s suggestions, the Council recommended the following

The Council further recommended the creation of a national insurance program to supplement the activities that are at present being carried on by the individual state county and city plans but not to interfere with any of the present plans It recommended that it proceed with a national insurance company in the manner suggested by Mr Don Hawkins whereby the American Health Insurance Corporation would be used as the vehicle to carry out the activities in each state in agreement with the individual states that the members of the medical profession form a holding company as provided in Mr Hawkins suggestions such persons to be selected by the Board of Trustees and the Council on Medical Service and Public Relations It was stated that the plan can be put into effect in less than ninety days. It further recommended that in the event the Board of Trustees rejects the proposals made by the Council relative to using the American Health Corporation as a vehicle for establishing a national insurance program the Trustees should endorse and support a national insurance company sponsored and in cooperation with outside groups by contributions from various medical societies and the American Medical Association

In view of the fact that the meeting of the fifty-two plan directors felt that the national coverage could best be accomplished through coordination of existing plans such as arranged in the program of the Associated Medical Care Plans and that there would be opposition on the part of various local plans to the establishment of an independent company, no action was taken to put this recommendation into effect.

The Board of Trustees on February 16 released a statement to the press outlining a national program for voluntary prepayment medical care. In brief, this consisted of the following

1 Creation of a Division of Prepayment Medical Care Plans under the Council on Medical Service and Public Relations

This division is now under the direction of Mr Jay Ketchum, Executive Vice President of Michigan Medical Service.

2 Formation of Associated Medical Care Plans, which has been incorporated under the Illinois statutes A constitution and by-laws for this organization has been prepared and adopted.

3 Creation of an Advisory Committee consisting of Mr Jay Ketchum, Detroit, executive vice president of Michigan Medical Service, Dr F L Feierabend, Kansas City, Mo., secretary, Surgical Care, Inc , Dr Herbert H Bauckus, Buffalo, N Y , Mr William Bowman, San Francisco, executive director, California Physicians' Service, and Mr Charles Crownhart, Madison Wis , secretary, State Medical Society of Wisconsin.

4 A redraft of the Fourteen Point Constructive Program for Medical Care.

5 A draft of suggested standards of acceptance prepared by the Council on Medical Service and Public Relations

*How the Program Functions*

In a national program the Council on Medical Service and Public Relations and Associated Medical Care Plans will cooperate to further the development of methods for distributing the costs of medical care On its part the Council undertakes the work of coordinating and encouraging existing plans and assists in the development of plans where they do not now exist In addition an up to date file on each plan has been completed, including information on and copies of the following

1 Enabling act.
2 Articles of incorporation
3 Constitution and by laws
4 Regulations
5 Subscribers' certificates or group contracts
6 Contract or agreement with Blue Cross.
7 Agreement with participating physicians
8 Figures on enrolment
9 Financial status

For its part Associated Medical Care Plans, an organization of administrators, assists in the detailed administrative work and assists the Council in the overall job of developing uniformity and reciprocity among the plans

The national program centers around the standards for acceptance of prepayment medical care plans as a basis on which the Council will grant an official seal to be displayed on all plan literature

RATING COMMITTEE

The committee appointed to study the relative values of various surgical procedures has not met since the December 3 meeting of the House of Delegates However, the preparatory work for this job has been continued in the Council office A comparison of the reimbursement schedules of five private insurance carriers and twenty medical society sponsored prepayment plans has been completed. This and other pertinent material will be submitted to the proper specialty groups for consideration as to relative values

NATIONAL HEALTH CONGRESS

Resolutions introduced by Dr E S Hamilton, Illinois, called for the creation of a National Health Congress to be composed of 'representatives of the medical, dental, hospital, nursing, pharmaceutical and allied professions" These resolutions were referred to the Reference Committee on Legislation and Public Relations and adopted by the House of Delegates In view of these resolutions the Council has sent a questionnaire to each state medical society secretary in order to obtain information on the activities and purposes and an evaluation of the benefits of state and local health councils now functioning The Board of Trustees has asked that the Council withhold any activity in forming a national organization until further detailed information can be obtained in regard to these local health councils, interprofessional committees and similar organizations

RURAL HEALTH

The first Annual Conference on Rural Health was held in Chicago March 30 by the Committee on Rural Medical Service of the American Medical Association in cooperation with the Farm Bureau, Farm Foundation, Grange and other farm groups The Bureau of Information and the Council on Medical Service and Public Relations were in charge of arrangements for this meeting, which was attended by more than 250 representatives of the farm groups and state medical societies

PERMANENT CONFERENCE ON MEDICAL CARE

Resolutions on Permanent Conference on Medical Care, introduced at the last session of the House of Delegates, were referred to the Board of Trustees and the Council This resolution provided that the House of Delegates "instigate the formation of a Permanent Conference on Medical Care' The Council believes that no action on this resolution should be taken at this time.

MEETINGS OF THE COUNCIL

An organization meeting was held immediately after the final session of the House of Delegates in December Dr E J McCormick was reelected chairman and Dr James R McVay reelected vice chairman The executive committee, consisting of Dr McCormick, Dr McVay, Dr A W Adson and Dr Louis H Bauer, was reappointed

A meeting of the executive committee was held on January 11 in the Council office. Immediately after this meeting a joint meeting with the Executive Committee of the Board of Trustees to discuss a prepayment medical care program was held. A second meeting of the Council was held on February 13 and 14 On February 14 a joint meeting with the Board of Trustees followed

BULLETINS NEWS LETTERS AND COUNCIL RELEASES

The NEWS LETTER of the Council is sent to about 2,700 physicians who are state medical society officers or committee members or local society officers who are interested in the activities of the Council

Along with the NEWS LETTER have been enclosed various articles and reprints on pertinent subjects Among these were Dr Louis H Bauer's article 'Medical Care for the American People," Dorothy Thompson's editorial on prepayment insurance and pamphlets from the Insurance Economics Society of America

In addition the Council has had almost weekly columns in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION under the Council heading These columns deal with pertinent information on Council activities

The Washington office has issued regular bulletins on legislative matters Dr Joseph S Lawrence, Director, will discuss this in his portion of the report

*Prepayment Medical Care Plan Brochure*—The Council, with the cooperation of the Bureau of Medical Economics, is preparing a complete and up to date brochure on voluntary prepayment medical care plans The material has been organized in such a manner as to provide a means for comparison between various plans All figures and statistics have been gathered as of the same date so that again comparisons as to enrolment and other features will be possible. The principal subjects by which each plan is described are as follows

1 Organization
2 Governing body
3 Medical society approval
4 Area covered.
5 Type of contract.
6 Income limits
7 Enrolment.
8 Benefits
9 Exclusions.
10 Waiting period
11 Monthly premiums
12 Blue Cross relationship
13 Change of employment
14 Insignia used
15 Miscellaneous

*Handbook on Compulsory Health Insurance*—The Council, again with the cooperation of the Bureau of Medical Economics, is preparing a handbook on compulsory health insurance. It is planned that this might be divided into two parts, one to be used as a debaters manual for high school and college students and the other as a source of information for physicians who wish to give talks to the lay public on the subject

REGIONAL CONFERENCES

Probably the most important feature of the program of the Council from the standpoint of the state and county medical societies has been the various regional meetings The first was held in May 1944 in Boston, the second in Cincinnati, the third in Washington, D C the fourth in Kansas City, Mo, the fifth in Atlanta Ga , and the sixth in Portland, Ore.

Since Jan 1 1946 two additional conferences have been held, and a third and fourth are planned

The seventh regional conference sponsored by the Council was held in Philadelphia on January 30 with representatives from

New York, Delaware, New Jersey, Pennsylvania, the District of Columbia, Virginia and Maryland Dr F F Borzell, Vice Speaker of the House of Delegates, was local chairman The eighth regional conference was held in Boston on February 3 with Dr James R. Miller, member of the Board of Trustees, as chairman

These two conferences pointed specifically toward three problems what prepayment plans and the medical profession can do in bettering medical care for veterans, growth in prepayment plans and local medical society public relations methods The ninth and tenth regional conferences are to be held in Denver and San Francisco The Denver conference will be under the direction of Dr. McVay, vice chairman of the Council, and the San Francisco conference under the direction of Dr E J McCormick, Council chairman.

WASHINGTON OFFICE

The Washington Office continues to grow in opportunities for service to both the physicians of the several state societies and the government bureaus Acquaintanceship with the Congressmen is rapidly extending, limited only by the ability to find time to call on them Spot calls have been made frequently when physicians visiting the capital have asked the office to assist them in locating their congressmen Acquaintances made when calling in this manner have invariably proved profitable

The office space is still deplorably inadequate, and there is no immediate prospect of relief When the building of offices can be resumed, the owners of the building in which the office is located will build an extensive addition The plans are completed for that addition, and at least twice as much space should be available

Since the last report the Washington office has distributed seventeen bulletins Most of the bulletins carried information relating to bills before Congress, but recently reports have been made on the hearings that are being held by the Senate Committee on Education and Labor on the Wagner-Murray-Dingell bill, known as the National Health bill The statements of the principal witnesses were reported almost in full because of their importance The office is now abstracting the submitted statements and reporting from notes made. The committee holds hearings at least five days a week from 10 o'clock in the morning Frequently they are extended over the whole day At first it was intended to limit the hearings by calling only witnesses who would represent national organizations, but so many requests are being made by Senators to have important persons from their states heard that the committee is planning to modify its program accordingly, and hearings may extend into June. After the termination of the hearings the statements of the witnesses, together with those which were submitted to the committee by mail, will be printed for the benefit of the members of the committee. After studying the printed reports, the committee will consider the bill in executive sessions Considerable study will be required before the committee can arrive at a decision as to whether the bill should be reported out to the floor of the Senate and to what extent it should be amended or redrafted In view of a number of limitations, such as the possibility of an early recess in July and the fact that the recess might be prolonged until after election or even until January when the new Congress will assemble, and realizing that Congress still has a number of bills of the present program to act on it does not seem probable that the health bill will reach the floor of the Senate during this session. The Committee on Interstate and Foreign Commerce of the House, which has the Dingell bill, is apparently waiting for the Senate to take action before it takes up consideration of the bill

Most of the bills that have been reported by the Washington office as introduced in the Seventy-Ninth Congress have not been acted on The following have received consideration

*Bills Acted on*

S J Res. 89 formation of an International Health Organization, was reported out of Senate Committee on Foreign Affairs on Nov 23 1945 and passed the Senate on Dec. 20, 1945 Referred to House Committee on Foreign Affairs Dec. 21 1945

H. R. 2716 to provide for health programs for government employees was reported out of committee on Feb 1 1946 (passed House on Sept. 21 1945)

H. R 4512 mental health bill passed by the House on March 15 1946 It is now with the Senate Committee on Education and Labor

*Hearings on Bills*

S 191 hospital construction bill, hearings held before the Public Health Subcommittee of the House Interstate and Foreign Commerce Committee on March 7 Senate had passed the bill on Dec 11, 1945, with amendment

S 1160, mental health bill hearings before Education and Labor sub committee of Senate on March 6, 1946 and continued through March 8

S 1606 national health insurance bill hearings began April 2 1946 before the Senate Committee on Education and Labor and are still continuing

S 1779 social protection bill Education and Labor Committee of Senate held hearings on March 9, 1946 Bill has been reported out of committee

S 1850 the national scientific foundation bill is the latest bill drafted by the Senate Military Affairs Subcommittee as a substitute for S 1285 S 1297 and S 1720 The bill had hearings in February and March and it has been reported out of committee without amendment

H. R 491 antivivisection bill, hearings were held February 28

H R. 3755 to establish an Optometry Corps in the Medical Department of the U S Army, had hearings before the Senate Military Affairs Committee Jan. 24 1946 Reported out of committee February 21

H R 4070 The House Committee on Rivers and Harbors began hearings on water pollution bills on March 26, 1946

H R 5234, social protection bill hearings were held on March 18 1946 before the House Judiciary Committee

*Social Security*

Hearings have been going on since Feb 25 1946 before the House Ways and Means Committee on the old age and survivors' insurance provisions

*Physically Handicapped*

The House Labor Subcommittee on Aid to Physically Handicapped held hearings on April 2 3 and 4 regarding federal agencies dealing with the physically handicapped.

*Bills Enacted into Law*

S 714 compensation for U S employees injured in performance of their duties, became Public Law 139 on July 6, 1945

S 715, providing more efficient dental care in U S Navy became Public Law 284 on Dec 28, 1945

H J Res. 23 establishing first week in October of each year as National Employ the Physically Handicapped Week, became Public Law 176 on Aug 11, 1945

H R 2348 providing for coverage of certain drugs under federal narcotic laws became Public Law 320 on March 8 1946

H R 3266, to amend the Federal Food, Drug and Cosmetic Act became Public Law 139 on July 6 1945

H R 4717, establishing a Department of Medicine and Surgery in the Veterans Administration, became Public Law 293 on Jan 3 1946

Bills that carry large appropriations, probably requiring special tax levies, are being held up in the interest of an effort to balance the budget. The President and congressional leaders are united in this effort. When the Seventy-Ninth, which is the present Congress, ends on Dec. 31, 1946, all the bills now pending will be dropped permanently unless they are reintroduced in the new, the Eightieth, Congress, which will convene in early January

The bulletin mailing list has been growing rapidly, not only because of the appointment of state committees but also by requests from individual physicians Mimeographing this bulletin has become quite a problem. It must be done by commercial firms, and the Washington rates are generally higher than those charged in other cities A mimeograph machine will be installed in the office as soon as space can be procured.

The following groups have been addressed by the director since the last report League of Women Voters, District of Columbia, Takoma Park Women's Club, Takoma Park, Md., New England Regional Conference, Boston, Berks County Medical Society, Pennsylvania, Philadelphia County Medical Society, Pennsylvania, the Kober Club of Physicians, District of Columbia

Respectfully submitted

# MEDICINE AND THE WAR

## ARMY

### DIPHTHERIA IMMUNIZATION ORDERED FOR ETO, MTO PERSONNEL

Active diphtheria immunization will be required for all military personnel under 35 years of age assigned to permanent duty in European and Mediterranean theaters. The immunization program is in furtherance of the Army's preventive medicine policy. The preventive policy is a precautionary measure enforced during the war and demobilization.

Civilians in that age group, including those in army employ and civilian dependents, will also be immunized before going overseas. Those in all categories over 35 years are advised to avail themselves of the measure. Negative Schick tests will be accepted in lieu of immunization.

Other protective inoculations required before permanent assignment in those theaters are smallpox, typhoid and typhus. Tetanus immunization is required for all military personnel.

### IMMUNIZATION AND INSPECTION OF G I PETS

Additional safeguards against importation of foreign diseases into the United States are being employed at overseas debarkation points, as soldiers must have their acquired pets examined and vaccinated by a veterinary corps officer. Monkeys, dogs, cats and any other animal a G. I. might plan to bring home will be inoculated with a Habel mouse-tested rabies vaccine. This must be done "not more than one hundred and eighty days nor less than thirty days" before entry into the United States.

### MASON GENERAL HOSPITAL CITED

The meritorious Service Unit plaque was awarded to Mason General Hospital, Brentwood, N. Y., for the period from Dec. 1, 1944 to May 1, 1945. The citation accompanying the award stated that "its accomplishments in the care and disposition of mentally ill patients are considered an outstanding contribution in the field of military hospitalization and evacuation. Only through enthusiastic and unselfish devotion to duty could such high standards of service be attained. The accomplishments of this unit reflect great credit on itself and the military service."

### ARMY AWARDS AND COMMENDATIONS

#### Colonel Warren C. Fargo

The Legion of Merit was recently awarded to Col. Warren C. Fargo, Cleveland, who for five years served as executive officer, assistant commandant and commandant of the Medical Department Enlisted Technicians School at Brooke Hospital Center, Fort Sam Houston, Texas. The citation stated that "Colonel Fargo occupied a position of great responsibility and perfected training methods which produced superior results in the training of Medical Department technicians." Dr. Fargo graduated from the University of Buffalo School of Medicine in 1913 and entered the service March 21, 1941.

#### Colonel James H. Turner

The French Legion of Honor was recently awarded to Col. James H. Turner, formerly of Sacramento, Calif., for medical services rendered with the 203d General Hospital in Paris, France, between Aug. 27, 1944 and VE day by Major Gen. Ray W. Barker, commanding general for U. S. Headquarters Berlin District, representing the chief surgeon for the European theater in the presentation. Dr. Turner graduated from the University of Nebraska College of Medicine, Omaha, in 1924 and entered the service in August 1928.

#### Colonel Mather Cleveland

Col. *Mather Cleveland*, New York, was recently awarded the Legion of Merit "for exceptionally meritorious conduct in the performance of outstanding services as senior consultant in orthopedic surgery, Professional Operations, during the period of May 17, 1944 to May 8, 1945". The citation further stated that Colonel Cleveland "rendered unusually superior service in supervising the activities of the orthopedic surgeons in the theater. His direction of highly trained specialists whose talents were of vital importance in treating many battle casualties revealed exceptional professional competence. Colonel Cleveland's innovations for the treatment of injured hands did much to benefit the care of this type of injury and reflects great credit on himself and on the armed forces of the United States."

Colonel Cleveland was also awarded the French Medaille d'Honneur by Médecin Général Debenedetti, Docteur Général du Service de Santé, Ministrie de la Guerre, Paris, France, "for services performed in reestablishing Franco-American relations in medicine and surgery during the period from November 1944 to July 1945 and in assisting the medical corps of the French army in providing adequate medical care for their troops." Dr. Cleveland graduated from Columbia University College of Physicians and Surgeons, New York, in 1915 and entered the service Sept. 3, 1942.

#### Colonel Martin F. DuFrenne

Col. Martin F. DuFrenne, Washington, D. C., who was recently awarded the Legion of Merit, "served with marked distinction as surgeon, Military District of Washington, and as commanding officer, Station Hospital, Fort Myer, Virginia, from Aug. 31, 1942 to June 9, 1945. In his dual role [the citation continued] Colonel DuFrenne was confronted with many perplexing problems incident to continued changes in medical personnel, supply and administration. His successful solution of them was reflected in the superior health record established both for the military district of Washington and the personnel of his station and in the high standards of operating efficiency achieved and maintained by the station hospital. Although working under the stress of heavy responsibilities, he at all times exercised unfailing good cheer, a sympathetic attitude toward the sick and wounded and outstanding professional skill. By his splendid example Colonel DuFrenne inspired those who worked under him to greater endeavor. His devotion to duty and the service he rendered were in keeping with the highest traditions of the United States Army." Dr. DuFrenne graduated from Marquette University School of Medicine, Milwaukee, in 1916 and entered the service July 1, 1920.

#### Lieutenant Colonel John N. Robinson

Lieut. Col. *John N. Robinson*, Sharon, Conn., was recently awarded the Legion of Merit "for exceptionally meritorious conduct in the performance of outstanding services as senior consultant in genitourinary surgery, Professional Services Division, Office of the Surgeon, Communications Zone, European Theater of Operations, from Oct. 5, 1943 to May 8, 1945." The citation further states that "Lieutenant Colonel Robinson, in addition to supervising the work of two hundred urologists, created a uniform system of treatment for complicated diseases of the genitourinary tract, surgery which has been of extreme importance in saving the lives of wounded American soldiers. He was instrumental in establishing contacts with both the French and the British medical institutions for the introduction of postgraduate facilities where American officers trained in urology could receive further instructions along highly specialized lines. Lieutenant Robinson, through professional skill and inspirational leadership, has materially assisted the department in discharging its responsibilities in a highly efficient manner."

Dr Robinson was also honored with the Medaille d'Honneur by Médecin General Debenedetti, Docteur Général du Service de Sante, Ministrie de la Guerre Paris, France, "for services performed in reestablishing Franco-American relations in medicine and surgery during the period from November 1944 to July 1945 and assisting the medical corps of the French army in providing adequate medical care for their troops" Dr Robinson graduated from Harvard Medical School, Boston, in 1931 and entered the service Feb 15, 1942

### Colonel Condict W Cutler Jr

Col Condict W Cutler Jr, New York, who distinguished himself in the performance of service as surgical consultant, First Service Command, from December 1943 to October 1945, was recently awarded the Legion of Merit. The citation stated that "during this period Colonel Cutler, through his professional ability, built up and maintained highly proficient surgical standards in all the hospitals within this command With a wide knowledge of the anatomy and surgery of the hand, he developed new technics in the restoration of function of hands crippled by wounds, thus giving many members of our armed forces an opportunity to follow gainful occupations without the handicap of artificial appliances His enthusiasm for his work, his readiness to share his vast clinical knowledge and his devotion to duty were an inspiration to all those with whom he worked Colonel Cutler was a great influence in the achievement of the splendid surgical treatment given the sick and wounded of World War II" Dr Cutler graduated from Columbia University College of Physicians and Surgeons, New York, in 1912 and entered the service Oct. 10, 1943

### Lieutenant Colonel James T Priestley

An Oak Leaf Cluster to the Bronze Star was recently awarded to Lieut. Col James T Priestley, Rochester, Minn., for "meritorious achievement from May 25 to Aug 15, 1945" During this time, the citation accompanying the award continued, "Colonel Priestley displayed exceptional professional ability and resourcefulness in the execution of the numerous complex duties demanded of his assignments. He maintained the highest standards of professional care for patients and gained the complete cooperation of all personnel of his command. In addition, he kept hospitalization to a minimum, thus enabling units to maintain adequate effectives for combat duty In charge of an advance party for the movement of the hospital from New Guinea to the Philippine Islands, he supervised the innumerable details with great foresight and understanding and achieved a smooth and efficient transfer of hospital facilities to Batangas Luzon Working with driving energy, he personally drew plans for the new hospital and expedited its construction so that complete medical services could be furnished patients in the shortest possible time. Displaying unusual ability to enlist the fullest cooperation of officers, nurses and enlisted men, he improved the efficiency of every function of the hospital, completely eradicating malaria in his organization and curbing other usually prevalent diseases Through superior professional ability and inspiring devotion to duty, Colonel Priestley made a notable contribution to the care of the sick and wounded in the southwest Pacific area' Dr Priestley graduated from the University of Pennsylvania School of Medicine, Philadelphia, in 1926 and entered the service Jan. 14, 1943

### Lieutenant Colonel Robert L Preston

Lieut. Col Robert L. Preston, New York, was recently awarded the Legion of Merit for "performing distinguished service in various important assignments at Nichols General Hospital, Louisville Ky, and in the Office of the Surgeon Fifth Service Command, from July 1943 to December 1945" In further praise to Colonel Preston, the citation said that he utilized his exceptional background in orthopedic surgery, developing original and effective programs of prevocational education and guidance for disabled army personnel" Dr Preston graduated from the University of Nebraska School of Medicine, Omaha, in 1928 and entered the service Jan 26 1942

### Major Franklin H Grauer

Major Franklin H Grauer, formerly of New York, was recently commended for his research work with penicillin in the treatment of syphilis The citation accompanying the award was presented by Brig Gen John M Willis, commandant, Brooke Army Medical Center, Fort Sam Houston, Texas, who said "During World War II the Medical Department carried out its mission with outstanding success This achievement was made possible only through the combined efforts of all medical department personnel Your service with the medical department has been exceptional when compared with others of the same grade of similar position and I wish to commend you for your outstanding contribution as chief of the Penicillin-Syphilis Research Project at Camp Howze, Texas, and Camp Livingston, Louisiana, under the direct supervision of the Venereal Disease Control Division, Preventive Medicine Service, Office of the Surgeon General, from March 1, 1944 to Nov 30, 1945" Dr Grauer graduated from Johns Hopkins University School of Medicine, Baltimore, in 1929 and entered the service in July 1942

### Brigadier General Edward Reynolds

The Distinguished Service Medal was recently awarded to Brig Gen. Edward Reynolds, Malden, Mass, for "exceptionally meritorious service from April 1944 to August 1945 as chief, Supply Service, Surgeon General's Office, Army Service Forces He implemented a program insuring the timely and adequate flow of medical supplies to all parts of the world and effected changes in the organization and functions of district and depot procurement agencies that resulted in increased operating efficiency and material savings in trained manpower Under his control both the procurement and distribution of supplies, many items of which were difficult to produce and yet of vital necessity to the troops, proceeded smoothly" Dr Reynolds graduated from Harvard Medical School, Boston, in 1923 and entered the service Oct. 19, 1943

### Major Paul A Newton

The Silver Star Medal was recently awarded to Major Paul A Newton, San Mateo, Calif, "for gallantry in action at Luzon, Philippine Islands Captain Newton (now Major Newton) a battalion surgeon, braved enemy mortar and small arms fire and fragments from bombs in an exploding ammunition dump in order to give medical treatment to a seriously wounded man. The casualty lay in an enemy mine field, but Captain Newton picked his way forward and successfully administered first aid. Later, during the battle for Manila on Feb 15, 1945 Captain Newton again voluntarily exposed himself to hostile fire in an effort to save the life of a mortally wounded officer" Major Newton also holds the Bronze Star with one Oak Leaf Cluster for heroism in action, the Order of the Purple Heart, and the Presidential citation for work during the Bougainville and Luzon campaigns Dr Newton graduated from the University of California Medical School, San Francisco, in 1942 and entered the service Aug 16, 1943

### Colonel Horace S Villars

Col Horace S Villars, Washington, D C, was recently presented the Legion of Merit for distinguishing himself as port surgeon at San Francisco Port of Embarkation from November 1943 to October 1945 The citation accompanying the award read, in part, "By his efficient performance, splendid cooperation, unselfish devotion to duty and thorough knowledge of medical activity requirements of the port, an exceptionally high standard of health was maintained at the port and installations under its control" Dr Villars graduated from the University of Minnesota Medical School, Minneapolis, in 1916 and entered the service Sept. 3, 1917

### Lieutenant Colonel Hyman M Hurevitz

The Bronze Star was recently awarded to Lieut Col Hyman M Hurevitz, Davenport, Iowa, for his study of diarrhea and dysentery among American troops in the Mediterranean area from May 1, 1943 to May 8, 1945 Dr Hurevitz graduated from the State University of Iowa College of Medicine, Iowa City, in 1930 and entered the service in August 1942

### Brigadier General Hugh J Morgan

The Distinguished Service Medal was recently awarded to Brig Gen Hugh J Morgan, Nashville, Tenn The citation stated that, "as chief consultant in medicine, Office of the Surgeon General, from February 1942 to August 1945, he performed exceptionally meritorious service Through his untiring efforts the best medical talent of the country was mobilized for service with the army Demonstrating marked ability, initiative and judgment in formulating professional policies in the field of medicine and in the assignment of the highest type medical personnel as consultants and chiefs of services, he contributed to the excellent type of medical care received by seriously sick enlisted men and officers He implemented the procurement of the latest and best supplies and equipment obtainable in order to further alleviate suffering" Dr Morgan graduated from Johns Hopkins University School of Medicine, Baltimore, in 1918 and entered the service Feb 11, 1942

### Brigadier General Fred W Rankin

Brig Gen Fred W Rankin, Lexington Ky, was recently awarded the Distinguished Service Medal "for exceptionally meritorious services from March 1942 to August 1945 According to the citation accompanying the award, in his capacity as chief consultant in surgery, Surgeon General's Office, he contributed in great measure to the high standards of surgical care afforded the seriously wounded of this war He was responsible for the assignment of the highest type surgical personnel and the selection of the most modern surgical supplies and equipment available He expended untiringly both time and effort in furthering the surgical program of the Army's Medical Department, thereby contributing materially to the unprecedented successes attained" Dr Rankin graduated from the University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore, in 1909 and entered the service March 1, 1942

### Captain Solomon Sherry

A special award was recently presented to Capt Solomon Sherry, New York, from the United States Typhus Commission The citation accompanying the award stated that Captain Solomon Sherry rendered meritorious service in connection with the work of the United States of America Typhus Commission during the period May 12, 1945 to July 12, 1945, by intensive and successful efforts in case finding and by vigorous application of control measures This service, rendered at a time when advancing American troops had liberated the victims of the concentration camps of Flossenburg and Mauthausen, safeguarded the military forces and reduced the danger of the spread of typhus" Dr Sherry graduated from the New York University College of Medicine in 1939 and entered the service Sept 18, 1942

### Colonel Midian O Bousfield

The Legion of Merit was recently awarded to Col Midian O Bousfield, Chicago, first Negro member in the Army Medical Corps and now the first Negro medical officer commissioned in the reserve as a full ranking colonel The citation accompanying the award read in part, that 'Colonel Bousfield played an important part in the excellent racial relationship" at Fort Huachuca, Arizona, "where a mixed racial population required a tolerant and understanding leader" Dr Bousfield graduated from Northwestern University Medical School, Chicago, in 1909 and entered the service June 7, 1942

### Captain Robert R Colombo

The Army Commendation ribbon was recently awarded to Capt Robert R Colombo, Brooklyn, for "meritorious work connected with the staff of the Wakeman General Hospital, Camp Atterbury, Indiana" The citation commended Captain Colombo for his unselfish devotion to the welfare of the sick and wounded and for his service rendered Dr Colombo graduated from the Long Island College of Medicine, Brooklyn, in 1933 and entered the service Feb 21 1941

### Major Edward H Truex Jr

Major Edward H Truex Jr, chief of the Aural Rehabilitation Section at the Army's Deshon General Hospital, Butler, Pa, was recently awarded the Army Commendation Ribbon from the Third Service Command for "meritorious and outstanding performance of duty" The certificate contained the following citation "Major Edward H Truex, Medical Corps, is hereby authorized to wear the Army Commendation Ribbon by direction of the Secretary of War for meritorious and outstanding performance of duty, as chief, Aural Rehabilitation Section, Deshon General Hospital, from July 27, 1944 to Dec 6, 1945 His keen foresight, organizational ability and tact have enabled him to obtain maximum effectiveness from his personnel Tremendous work loads have been met without confusion, and morale has been kept at a high level His outstanding professional ability, unfailing enthusiasm and unhesitating use of his time and talents in subordination of his personal convenience have resulted in superior medical care for defened patients at this hospital and reflect credit on himself and the service" Dr Truex graduated from Harvard Medical School, Boston, in 1936 and entered the service Sept 10, 1942

### Major Harry L Freedman

Major Harry L Freedman, Dannemora, N Y, was recently awarded the Legion of Merit The citation accompanying the award stated that "Major Harry L Freedman as director, Mental Hygiene Division, ASFTC, Camp Plauche, New Orleans 12, La, from July 20, 1944 to Jan 2, 1946, displayed exceptional skill and was eminently successful in the organization and direction of this unique staff section His unit handled more than 4,000 cases of maladjusted soldiers With the aid of this outstanding service the problem of eliminating noneffectives from this command was solved in a highly efficient manner In achieving this objective he exhibited an unusually high degree of resourcefulness and creativeness which aided immeasurably in the accomplishment of military missions which are vital to the maintenance of the mental health of military personnel Through unselfish devotion to duty, leadership and exemplary performance Major Freedman reflects credit to the service, his profession and himself" Dr Freedman graduated from Harvard Medical School, Boston, in 1928 and entered the service May 31, 1941

### Colonel Richard P Strong

Col Richard P Strong, Boston, was recently awarded the Legion of Merit for meritorious services from October 1942 to September 1945 The citation related that "as director of tropical medicine, Army Medical School, he supervised and participated in the instruction of nearly 2,000 students, including medical officers of five allied governments and staff members of American medical colleges He also wrote and frequently revised the textbook used for this instruction By his profound knowledge, extensive experience of more than forty years in tropical medicine and inspiring leadership he contributed in an outstanding degree to the diagnosis, prevention and treatment of tropical diseases in the military forces with great credit to himself and to the military service" Dr Strong graduated from Johns Hopkins University School of Medicine, Baltimore, in 1897 and entered the service Nov 30, 1942

### Major Rafael Rodriguez-Molina

Major Rafael Rodriguez Molina, San Juan, P R, was recently awarded the Army Commendation Ribbon, the citation reading "The Army Commendation Ribbon is hereby awarded for commendable service from May 22, 1942 to Feb 12, 1946 as assistant chief and chief of the medical service, 161st General Hospital A P O 851, U S Army During this period Major Rodriguez-Molina displayed outstanding efficiency and devotion to duty His professional skill coupled with exceptional tact and keen knowledge of the psychology and customs of Puerto Ricans contributed greatly to the accomplishment of the medical mission of this department His accomplishments reflect great credit on him and on the military service" Dr Rodriguez-Molina graduated from the Medical College of Virginia, Richmond in 1926 and entered the service May 22, 1942

# NAVY

# MISCELLANEOUS

## BETTER CARE FOR MENTAL PATIENTS

Dr Forrest M Harrison, director of the Psychiatric Personnel Placement Service, stated in a report to the National Committee for Mental Hygiene that many army and navy medical officers are entering the psychiatric field, which will result in better and more adequate care for both civilians and ex-servicemen with mental and nervous disorders As of May 1 approximately 650 medical officers have applied Some 65 per cent of these requested further psychiatric training, while the remainder want to enter positions directly

The service is sponsored jointly by the American Psychiatric Association and the National Committee for Mental Hygiene. It is open to civilian physicians as well as to those of the armed forces who seek positions and training opportunities

Applicants include doctors who became interested in psychiatry in the war, specialists who want a better understanding of emotional and psychosomatic problems of patients, physicians who had training in this special branch while in service and men who were experienced psychiatrists before entering the Army or Navy Requests for training include general neuropsychiatry, psychosomatic medicine, psychoanalysis and therapy in neuroses and psychoses

## UNRRA NEWS

### Malnutrition Present in Greek Children

A recent report from UNRRA Greek Mission indicates that a large percentage of all 6 to 14 year old children in Greece show physical evidence of dietary deficiency It is said that graphs of the height of the children examined show a pronounced diminution in height compared to 50,000 children measured in Attica-Boetica in 1942 A decrease in the average height in children is one of the most reliable indications of chronic malnutrition, he says, as loss of weight, which fluctuates easily, is not too accurate a means of measuring the effects of poor diet

Throughout Greece the picture is relatively the same. In the regions where the Swiss Red Cross provided supplementary feeding for the younger children during the war and occupation their height is almost normal compared to that of children of Athens three years ago The older children, between 10 and 16 years old, who were not eligible for the supplementary feeding have been retarded In the mountain area where the Germans did not permit the Red Cross to operate, all groups of children are stunted in growth

Chronic rickets, which indicates a lack of vitamin D, is also prevalent among the Greek children, Dr Mendeloff reports, and gingivitis, a gum inflammation which results from a deficiency of vitamin A, is prevalent among very young children

### McKesson and Robbins Contribute Tooth Powder and Aspirin

The McKesson and Robbins Drug Company, Bridgeport, Conn, recently contributed through UNRRA 98,412 containers of tooth powder to the people of Czechoslovakia and 5,400 tins of acetylsalicylic acid to the people of China Fiorella H La Guardia, director general of UNRRA, accepted the gift on behalf of the war victims The contribution was valued at $12,050 It will be shipped by UNRRA and distributed free on the basis of need in accordance with UNRRA policy

## EMERGENCY COMMITTEE FOR PHYSICIANS AND DENTISTS, INC

To aid returning veterans in finding space to resume their practice in medicine and dentistry Edwin S Lowe, president of the Hotel Ansonia, New York, recently made the second floor available, whereby eighty to one hundred physicians and dentists in New York City will find a solution to the current 'space shortage." "Thousands of hotels throughout the country," stated Mr Lowe, "could follow the example set by the Ansonia to 'make' space available to the veteran to give him that fair and well deserved chance."

With this purpose in mind Mr Lowe organized the Emergency Committee for Physicians and Dentists, Inc., a nonprofit organization, for the purpose of aiding the veteran in locating space to resume his practice.

The means used for providing space at the Ansonia and the various plans for rendering service to the veteran will be incorporated in a brochure and distributed as a "pattern" to those desiring to cooperate in furthering this movement throughout the country

## HOSPITALS NEEDING INTERNS AND RESIDENTS

The following hospitals have indicated to the Council on Medical Education and Hospitals that their house staff appointments have not been completed

FLORIDA

*St Vincent s Hospital, Jacksonville.* Capacity, *275* admissions *9 978* Sister Electa R.N Superintendent (2 interns, July 1)

ILLINOIS

*Illinois Masonic Hospital Chicago* Capacity *186* admissions, *5 280* Mr *William H Tenney,* Superintendent (resident—surgery resident—*obstetrics-gynecology)*

Moline Public Hospital Moline Capacity 246 admissions, 6 177 Miss Marguerite N Brooks R N Superintendent (2 interns, 1 resident—mixed service July 1)

NEW YORK

Our Lady of Victory Hospital Lackawanna, Capacity 180 admissions 4,499 Sister Bathilde Superintendent (interns)

Lincoln Hospital New York City Capacity *469*, admissions 9 889 Dr Alexander W Kruger, Medical Superintendent (interns resident—pathology)

PENNSYLVANIA

*Chester Hospital Chester Capacity 280 admissions, 7 071* Mr L. P Wray Superintendent (3 interns resident—mixed service)

*Protestant Hospital Nashville Capacity 128 admissions 4 150* Mrs. Lois Stow Superintendent (interns, residents—mixed service)

TEXAS

Santa Rosa Hospital *San Antonio* Capacity, *411 admissions 12,427* Sister Mary of Lourdes Superintendent (2 interns)

## MEDICAL AND SURGICAL RELIEF COMMITTEE OF AMERICA

The Medical and Surgical Relief Committee of America, Inc. (420 Lexington Avenue, New York 17), is helping many small hospitals in all parts of Europe to reestablish free medical service for the needy by donating supplies and equipment. Recently 39 mg of radium was sent to the Hospital for the Incurables in Naples and the Villa dei Gerani, also in Naples The radium is valued at $2,000

# PUBLIC HEALTH SERVICE

## RELEASE OF RESERVE OFFICERS ON ACTIVE DUTY

In a recent report by Dr Thomas Parran, Surgeon General, United States Public Health Service, Federal Security Agency, reserve officers on active duty with the Public Health Service who accumulated 38 or more points as of Sept 30, 1945 will be released from active duty by June 1, 1946 At monthly intervals thereafter, officers with totals of 34, 30 and 10 will be returned to civilian life. Points did not accumulate after Sept. 30, 1945

Any officer who previously had stated a desire for separation but who now wishes to remain in service beyond his eligible date should notify the Office of the Surgeon General

Those officers who held reserve commissions in the Army under the Army Student Training Program and were released by the Army to accept commissions in the Public Health Service will be expected to serve the same length of time in the Public Health Service as they would have served had they remained in the Army

# ORGANIZATION SECTION

## National Health Program

### PLATFORM ADOPTED BY THE AMERICAN MEDICAL ASSOCIATION

*One of the ten points in this platform will be published each week.*

8 Research for the advancement of medical science is fundamental in any national health program The inclusion of medical research in a National Science Foundation, such as proposed in pending federal legislation, is endorsed

## Washington Letter

*(From a Special Correspondent)*

May 27, 1946

### Veterans Administration to Increase Number of Patients

Dr Paul R. Hawley, medical director of the Veterans Administration, reports that the agency expects to treat 50 per cent more veterans a year in its existing hospitals by reducing administrative red tape and providing enough doctors to take care of veterans as they seek hospitalization Dr Hawley has just completed a tour of veterans hospitals and predicted that the Veterans Administration will be able to end its long hospital waiting lists by the end of this year He also revealed plans to increase salaries for resident doctors in training at veterans' hospitals to advance the program for more young physicians in the institutions.

### Two Federal Agencies Plan Employment for Disabled Workers

The Veterans Administration and the United States Employment Service have both launched programs to aid disabled veterans and other handicapped workers in finding jobs. The Veterans Administration has just arranged to give help to veterans who have had trouble getting and holding jobs because of ear trouble Courses will be given in lip reading speech and voice correction. The United States Employment Service will launch its program at Chicago, whereby the handicapped will be helped by an expanded placement service.

### Washington Slum Areas Criticized Again

Continuing its report on health conditions in the nation's capital the Metropolitan Health Council reported that more than 100,000 people are housed in 25,000 slum dwellings which lack inside water faucets and toilets, another 25,000 dwelling units are "substandard," and outmoded outdoor water hydrants and toilets backsiphon filth and sewage into the water supply The housing situation was reported to be worse than in any other city surveyed to date

### Bill Would Assist Mental Patients

Representative McMillan, Democrat of South Carolina, has introduced a bill which would allow legally competent persons suffering from mental disorders to be admitted to St. Elizabeths Hospital for treatment at their own request. The proposed legislation was drafted by the committee on mental health of the Medical Society of the District of Columbia, headed by Dr Winfred Overholser, superintendent of St. Elizabeths Hospital.

### District Health Conditions Defended

Major General Philip B Fleming of the Federal Works Administration followed up the blast by a Metropolitan Health Council survey against Washington hospitals with the statement that hospital conditions in the District of Columbia are deplorable." He advocated appropriation of funds by Congress for construction of a hospital center However, District Budget Officer Walter Fowler has come out in defense of the capital's health record, as follows "The District has a wonderful record in view of the fact that our hospital facilities have not adequately kept pace with population increases" He pointed out that the mortality rate in the District in 1945 was 9 7 per thousand of population, lowest in city history, the tuberculosis rate had shown a steady decline from 290 per hundred thousand of population in 1,900 to 61 9 per hundred thousand in 1945 The maternal mortality rate of 1 per thousand live births in 1945 was the lowest among the nation's large cities

### $47,000 in Fines Assessed Against Limb Makers

*The eight remaining defendants in the trial of some sixty* artificial limb makers on anti-trust charges have been sentenced following conviction at their trial before Justice Bower Broaddus Already fines totaling more than $47,000 for conspiracy to restrain trade in the artificial limb industry have been imposed against some twenty-five individuals and twenty-five companies manufacturing, selling and servicing artificial limbs who had pleaded nolo contendere, or unwillingness to contest government charges About half of the fines, ranging from $400 to $3,000, according to the size of the operation and the ability to pay, were suspended and the defendants placed on probation for a year

### Washington to Set Up Hospital Council

Following condemnation of lack of cooperation between Washington hospitals by a metropolitan health and hospital survey sponsored by the Council of Social Agencies a National Capital Area Hospital Council is in the process of formation. All hospitals in the District and nearby counties are to be represented. Representatives have drawn up by-laws The council will be patterned on similar groups in Cleveland and Boston During observance of National Hospital Day at Freedmen's Hospital, Rabbi Norman Gerstenfeld declared that the key words of our duties at home and abroad are "health, justice, decency, honor, righteousness and peace."

### Visiting Foreign Physicians Honored

The International Medical Club of Washington entertained as guests of honor Dr J Guiterrez Osorio, surgeon general of the Venezuelan army, and Raymond Darget, professor of urology at the University of Bordeaux Dr Walter Bloedorn dean of the Medical School of George Washington University and president of the club, welcomed the visitors, inviting them to take advantage of the "open door policy" of the American medical profession

### Rare Disease Studied in Leesburg, Va, Area

U S Public Health Service scientists are studing histoplasmosis, 4 cases of which have been reported near Leesburg, Va., since 1921 The most recent case was reported last September Only 100 cases of the disease have occurred since its discovery in 1906 in the Panama Canal Zone.

### Brief Items

The Medical Society of the District of Columbia has elected Dr Raymond T Holden, Washington physician recently discharged from the Navy, to be president for 1947

Col Wallace H Graham of Kansas City, Mo, personal physician to President Truman, received the French Chevalier of the Legion of Honor and the Croix de Guerre for services in Normandy He was cited for personally caring for wounded French soldiers

Dr Paul R. Hawley, Veterans Administration medical director, reports that 2,753 veterans have been treated in "surplus" hospitals taken over from the Army

The *District of Columbia Zoning Commission* has ruled that a doctor may set up an office in a residential area only if he lives on the premises

# Medical Legislation

## MEDICAL BILLS IN CONGRESS

### Maternal and Child Welfare

The Subcommittee on Aid to Physically Handicapped, House Committee on Labor, has scheduled hearings on three identical bills proposing to enact a Maternal and Child Welfare Act, H. R. 3922, H. R. 3994 and H. R. 4059. These are companion bills to legislation introduced by Senator Pepper and nine other Senators, as S. 1318. According to the announcement of the chairman of the House subcommittee, hearings will be held on May 28, May 29, June 6 and June 7. Representatives of the Association will testify on June 7.

### Dental Research

The Senate Committee on Education and Labor has reported favorably, with an amendment, S. 190, a bill to provide for, foster and aid in coordinating research relating to dental diseases and conditions and to establish a National Institute on Dental Research.

### Federal Security Agency

President Truman has submitted to the Congress Reorganization Plan No. 2 of 1946, proposing to transfer to the Federal Security Administrator the functions of the Children's Bureau, except those relating to child labor under the Fair Labor Standards Act, the Vital Statistic functions of the Census Bureau, and the functions of the United States Employees' Compensation Commission. He also indicated that he will recommend soon that legislation be promptly enacted making the Federal Security Agency an executive department. This plan will become effective unless the Congress rejects it within sixty days.

### Miscellaneous

The Public Health Subcommittee of the House Committee on Interstate and Foreign Commerce has reported the Hill-Burton hospital construction bill, S. 191, with amendments, to the full committee. One proposed amendment would eliminate the right of appeal to the courts if the Surgeon General refuses to approve an application for a construction project. Another would provide that four instead of five members of the Federal Hospital Council shall be persons who are outstanding in fields pertaining to hospital and health activities and that four instead of three members will be representative of the consumers of hospital services. A third amendment would authorize the appointment of additional commissioned officers in the Public Health Service.

The President has signed H. R. 6305, making permanent the provisions of the act of July 11, 1941 prohibiting prostitution in the vicinity of military and naval establishments.

H. R. 6448 introduced by Representative Mills, Arkansas, proposes to establish in the executive branch of the government an independent agency to be known as the National Science Foundation in order to secure the full development and application of the nation's scientific and technical resources for national defense, national prosperity and the national health and welfare.

## STATE LEGISLATION

### Louisiana

*Bills Introduced*.—H. 38 proposes to authorize the Louisiana State Board of Medical Examiners and the Louisiana Homeopathic State Board of Medical Examiners to issue temporary permits to native born citizens of foreign countries of the Western Hemisphere to intern and serve residency in the private and public hospitals of the state which are approved for training by the American Medical Association and the American College of Surgeons, to serve fellowships in medical schools, to serve fellowships in private clinics, to take training therein with and under the supervision of doctors who are qualified as specialists by their respective boards and to take training with private doctors who are qualified as specialists by their respective boards. The temporary permits would be limited to three years and would be issued only to graduates either of colleges and universities of the United States of America of "Class A College Standard American Medical Association" or to graduates of such foreign colleges and universities of countries of the Western Hemispheres of "Class A College Standard American Medical Association" or the equivalent thereof which the board may from time to time approve. No more than twenty-five temporary permits would be permitted to be issued in any one year, and the total out standing at any one time would not be permitted to exceed seventy-five.

H. 118, relating to the annual inoculation of dogs, proposes to require the owner of every dog over 3 months of age to cause such dog to be inoculated against rabies by a licensed veterinarian annually.

H. 148 proposes that all persons between the ages of 14 and 50 years, inclusive, residing within the state of Louisiana shall submit to a blood examination for syphilis by an approved laboratory test.

### Massachusetts

*Bills Introduced*.—H. 1899 proposes that no person shall sell, exchange, deliver or have in his possession with intent to sell, exchange or deliver any preparation containing dichlorodiphenyl-trichloroethane, hereinafter referred to as DDT, unless each bottle, can, package or other container containing such preparation is plainly labeled with a statement of the percentage of DDT contained in such preparation and the word 'Caution' followed by statements and warnings as to the toxicity of the preparation if inhaled or if brought into contact with the skin of man or animals, together with directions for removal of the same from the skin in case of accidental contact. The label would also be required to include instructions relative to the prevention of contamination of foodstuffs by such preparation. S. 507 proposes the creation of a commission for the continuous study and investigation of the problem of drunkenness within the commonwealth and all matters relating thereto.

*Bill Passed*.—H. 230 passed the house May 10 and the Senate May 20. To amend the medical practice act, it proposes to authorize the board of medical examiners to grant certificates of registration, without examination, to such persons as shall furnish with their application satisfactory proof that they have the qualifications required in Massachusetts to enable them to be examined and have been licensed or registered on a written examination in another state whose standards, in the opinion of the board, are equivalent to those in Massachusetts. The proposal also provides that no person shall be registered without an examination if he is a graduate of a medical school not approved by the approving authorities.

*Bills Enacted*.—H. 1728 has become chapter 293 of the Laws of 1946. It provides that all persons who were residents of the state at the time of their matriculation at the Middlesex University School of Medicine, and who received the degree of doctor of medicine from that college prior to Jan. 1, 1946 and all persons not residents of the state who received the degree of doctor of medicine from the university prior to Jan. 1, 1946 and who shall have interned in a charitable or municipal hospital within the state, said internship having commenced prior to June 1, 1946, shall be eligible to be applicants for registration as qualified physicians, shall be examined for such registration by the board of registration in medicine and shall be subject to and have the benefit of all pertinent provisions of law relative to such eligibility and examination to the same extent as if they had matriculated at said school prior to Jan. 1, 1941. H. 1780 has become chapter 272 of the Laws of 1946. Relating to the practice of pharmacy, it provides that schools of graduation may be approved by the board of registration in pharmacy and the commissioner of education and by the board of registration in pharmacy and the United States Veterans' Administration. S. 462 has become chapter 268 of the Laws of 1946. Relating to the replacement of a city board of health by a city health department, it provides that the commissioner of health be a citizen of the United States who has been graduated from a medical school approved by the state authorities for the approval of medical schools and either shall be the holder of a degree of public health with at least two years' full time experience in a responsible position in public health service or shall have had four years' full time experience in a responsible position in such service. He shall be eligible to be registered to practice medicine under the laws of the state.

# THE WAGNER-MURRAY-DINGELL BILL

## Hearings on S 1606—To Provide for a National Health Program

(NOTE.—*This is a condensation of the verbatim report of the hearings*—ED)

*(Continued from page 346)*

United States Senate, Committee on Education and Labor

APRIL 18, 1946

HONORABLE JAMES E MURRAY Presiding

PRESENT Senators Murray, Pepper, Ellender and Donnell

### Statement of Dr E I Robinson, President, National Medical Association, Accompanied By Dr Paul B Cornelli

DR ROBINSON The National Medical Association which is composed of approximately two thirds of the approximately 4 000 Negro physicians in this country and which is separate and distinct from the American Medical Association is in favor of and supports S 1606 known as the Wagner-Murray-Dingell bill It bases its support primarily on the fact that this bill is an expression of the democratic principle that an attempt will be made to give the most to the greatest number of individuals and because it is in conformity with the general welfare clause in our constitution

(*Dr Robinson cited statistics on Negro health*)

There is need for trained professional personnel in the Negro population There are only approximately 4,000 Negro physicians in this country, or 1 Negro physician for about every 3 500 Negroes In some states the number of Negro physicians is insufficient to take care of the needs of the population A study in North Carolina has shown that there is need for 800 Negro physicians in that state alone, yet at present there are only 170 In the state of Mississippi, with a million or so Negroes the number of Negro physicians is about 50 There are only about 1,700 Negro dentists in this country to care for a population of 13,000 000 Negroes There are other professional deficiencies, such as public health nurses, medical social workers and laboratory technicians

(*Senators Donnell Murray and Pepper with Dr Cornelli debated at some length the significance of the general welfare clause in the Constitution*)

### Statement of Dr Harold T Low, President, Association of American Physicians and Surgeons

DR. LOW The Association of American Physicians and Surgeons was organized a little more than two years ago In this short time it has gained far reaching and rapid acceptance having members in every state of the Union and in 851 county medical societies Its purpose is to represent physicians in the fields of medical economics public relations and legislation It is financed entirely by membership fees and accepts no donations or other financial aid outside its membership The association strongly believes that this nation can continue its customary record of health improvement and increasingly wider distribution of better medical care through the use of voluntary plans of prepayment sickness insurance for considerably less money than the costs of socialistic systems with their excessively expensive administration

The Association of American Physicians and Surgeons believes that the need for compulsory insurance and state medicine, as proposed by Senate bill 1606 is poorly established since the experience of those countries having this type of system does not indicate an improvement in health or medical care.

SENATOR MURRAY I would like to stop there. What countries in Europe have precisely the type which we have proposed here? DR. LOW None that I know of The association holds to the belief that no actual need can be shown or sound arguments advanced for socialization of medicine Therefore we are concerned with why apparently sincere and intelligent people continue to agitate for its adoption It is the answer to this question in our opinion that contains the sinister implications of a plan to socialize not only medicine but all industry as well If proponents of S 1606, which we claim constitutes socialized medicine, are sincere in their desire to provide better medical care with wider distribution of this service, and since experience of other countries shows that federal compulsory systems do not accomplish this objective, then perhaps socialization is starting on the wrong end For a number of years we have heard that one third of American people are ill housed, ill clad, ill fed and ill cared for, and yet government sources were maintaining that we enjoyed the best health of any nation in the world Analysis of these four postulates shows them to be purely economic If ill health is due to poor food or lack of sufficient food, it would seem that socialization should begin with the butcher and the grocer for certainly the problem of feeding the people should not be laid on the doorstep of the American medical profession The association is fearful that the scheme for the federal government to establish political control of physicians and their patients is an entering wedge for the accomplishment of a completely socialized economy for this nation We believe that the proponents of political medicine, a few knowingly and a majority unwittingly, are using this plan as a stepping stone to a socialistic state.

Compulsory health insurance will encourage public dependence increase bureaucracy and the burdens of taxation It will lower the standards of medical practice, hinder medical progress and result in regimentation of physicians and patients Physicians are fighting this bill, not for financial preservation but because they conscientiously believe it is not in the public interest but on the contrary, will result in a serious impairment of the nation's health We repeat, voluntary plans of prepayment medical care and hospitalization insurance will meet satisfactorily the health needs of the nation Insurance records for recent years show an increasingly greater acceptance of these plans by the American public. We urge that the federal government give support and encouragement to these voluntary plans which, if given time and not in the too dim distant future as the records indicate, will furnish the objectives of this bill without jeopardizing the system of medical care which has made this nation foremost in health without compulsion and regimentation We believe that the Association of American Physicians and Surgeons' "Plan for National Health" if executed will achieve health goals satisfactory to the most idealistic. Therefore we submit, for the consideration of the committee, the plan in these words

The association proposes and recommends that medical care and hospitalization prepayment insurance be made available to the public by establishing voluntary plans of nonprofit insurance in all states For all those unable to pay and if they so elect, the association proposes and recommends that the federal government share equally with the states in providing funds to purchase insurance for this group under a plan to be administered by state and local agencies of the respective states The selection of the voluntary plan to provide insurance for those unable to pay should be made by the state medical associations of the respective states, subject to agreement with the appropriate state agency and determined on a basis of securing the most comprehensive and economical coverage

Recognizing that this nation desires and is obligated to furnish the best medical care and hospitalization for veterans the association recommends that such medical care be provided by a physician of the veteran's choice and hospitalization be given as near to the veteran s home as possible whenever it is feasible to do so It is recommended that payment for these services be made by the Veterans Administration through a plan acceptable to the respective state medical associations and the Veterans Administration

Modern hospitals and health and diagnostic centers properly distributed in relation to need, are essential to the provision of adequate medical care. Therefore the association recommends that where such facilities are not available and cannot be furnished by local agencies the federal government give aid to the respective states for the purpose of providing additional

hospitals and health and diagnostic centers in those communities in which a need is shown and there is evidence of the communities ability to maintain them The administration of the plan of federal aid to hospitals and to health and diagnostic centers should be under the jurisdiction of the respective states and their local agencies

The association recommends the improvement of existing federal health agencies with increased facilities and personnel where need is shown, and emphasis placed on control by the local areas where the public health services are established Health departments should not administer medical care and should approve the policy of medical care being provided by the physician of the patient's choice.

Higher standards of nutrition, housing clothing and recreation should be achieved through education, individual initiative community effort and federal aid where needed

The association recommends that a nationwide campaign of health education should be conducted under the cooperating sponsorships of national medical associations, state medical associations county medical societies and state and federal agencies Emphasis should be placed on health education in the schools and enlistment of the aid of all local civic groups and agencies The educational campaign should stress the desirability for all individuals to participate in the voluntary plans of insurance

SENATOR MURRAY Do you desire to submit any further statement? DR. LOW With your permission sir The suggestion was made to this committee by William Green that a thorough investigation be made of the lobbying activities of certain medical organizations including the American Medical Association, and that the sources of their funds be made public May I respectfully suggest to the chairman of this committee that an equally thorough investigation be made of the groups lobbying for the Wagner-Murray-Dingell bills (S 1050 and S 1606)? The American public has a right to know whether this legislation has been drafted in response to popular demand or whether it is being sponsored by government officials who have a vested interest in perpetuating and expanding their own jobs On April 4 Arthur J Altmeyer chairman of the Social Security Board testified that Isadore S Falk had written the major portion of S 1606 with the aid of the U S Public Health Service I think it is of great importance to every one in this country to know about the professional competence and background of those who have essayed to write health and medical legislation that would affect 85 to 90 per cent of the population Who is Isadore Falk? What is his professional record? Who have been associated with him? What medical men have aided him? What part has Michael M Davis played in lobbying for this legislation? Who finances Mr Davis? What has been his past connection with the Rosenwald Fund? With what committees is he now connected for the purpose of pushing enactment of this legislation? How many federal civil servants are assisting Mr Davis despite the provisions of title 18 section 201, of the U S Code. These pertinent matters, I believe should be investigated by your committee

SENATOR MURRAY Thank you very much, Doctor I am sure it would be a great help if all these organizations would voluntarily submit to us statements of their organizations how they are financed and what money they have spent for or against this legislation. Some of the witnesses who have appeared here already who are sponsoring this bill have presented that, some organizations which favor the bill Dr Boas who explained the setup of his committee stated further the funds it has accumulated and how it has been spent. It would be helpful if all organizations on both sides would give us information such as Dr Boas gave us here this morning Of course, it would be a terrible task for this committee right now to launch into an investigation of these organizations We simply could not. This hearing will take maybe another month before we are through, and therefore it could not be expected that we could stop now and launch into an investigation of these organizations who are for or against this legislation You feel that there are not very many people in this country denied access to modern medical care? DR LOW I feel there are certain low income groups that perhaps are yes, sir

SENATOR MURRAY But you think there are few and it can be easily remedied? DR LOW It can be remedied by grants-in-aid to the states which would take care of the needy

SENATOR MURRAY How would it take care of those people in the very low income groups? In what manner would it make it possible for them to secure the best modern medical care and hospitalization? DR. LOW By the rules and regulations which the authority who had the regulation of the system would set up, a minimum wage under which a man would be entitled to these benefits as set up under the voluntary plans by the government paying that premium in a voluntary plan of insurance.

*(Senator Donnell brought out through Dr Low that the advisory committee with sixteen members appointed by the Federal Security Administrator would be mostly laymen)*

SENATOR DONNELL You state in your testimony that your organization is financed entirely by membership fees and accepts no donations outside its membership What are those fees? DR. LOW Ten dollars a year

SENATOR DONNELL You get all the income, or the association does, from that source? DR LOW Yes sir

### Statement of Vlado A Getting, M D, Secretary, Association of State and Territorial Health Officers, Commissioner of Public Health, Boston

DR GETTING I appear here today as secretary of the Association of State and Territorial Health Officers and have been authorized by the executive committee to speak for the entire association, which represents the forty-eight states the territories and the District of Columbia I am at the present time commissioner of public health of the commonwealth of Massachusetts, which position I have held since April 14 1943 The State and Territorial Health Officers are naturally in favor of any legislation which will benefit the public health of the nation. We are however, concerned that all such legislation should be administered efficiently and effectively in order that the people may derive the maximum benefit consistent with the minimum interference with their normal course of life For over seventy five years state departments of health have been charged with the responsibility of administering programs of public health The association therefore is in favor in principle of any bill which will ultimately bring about an improvement in public health The association, on the other hand, must call to the attention of the committee shortcomings in Senate 1318 and in Senate 1606 which in its opinion would be detrimental to the health of the people

As a member of the Subcommittee on Economics of the Committee on Postwar Planning of the Massachusetts Medical Society, I assisted in the formulation of certain statements which in my opinion are applicable to both of these bills They not only express the objectives of adequate medical care but set forth the prerequisites for the success of an officially administered medical care program These basic principles were adopted by a council of the Massachusetts Medical Society on Jan 9, 1946 and appear in the *New England Journal of Medicine* of March 7, 1946. They are as follows

1 The objective of adequate medical care in our free society is to make available to every one—regardless of race color creed financial status or place of residence—every known essential preventive, diagnostic and curative medical service of high quality The attainment of such medical care must necessarily be an evolutionary process which will require the cooperation of all concerned over a period of years.

2 The success of any plan for medical care is dependent on the mutual cooperation of the public those rendering professional services and the administrative agencies This cooperation can be obtained only if those rendering the services are convinced that they will have a continuing authoritative voice in the formulation and execution of policies and plans thereby assuming their proper share of responsibility

3 Provision of adequate medical care for those unable to obtain it by voluntary prepayment plans or by direct payment is the responsibility of the local or state government Part of the burden of this responsibility may be assumed by charitable agencies Federal grants-in-aid to state programs administered by state boards of health is an acceptable method of helping to meet this responsibility

4 The medical care of those who are able to purchase it by voluntary prepayment plans or by direct payment is the responsibility of the individual

5 Eligibility for receiving benefits under a program aided by federal grants should be determined by the individual states

6 The patient shall have free choice of his physician group of physicians clinic or hospital from among those participating in any plan, provided the physician group of physicians clinic or hospital selected shall have the right to refuse or to accept the patient.

7 Physicians and other qualified persons rendering medical care shall receive adequate remuneration for their services.

8. The physician shall be free to elect or reject without prejudice participation in a medical care plan The rights of the physician as to the choice of methods by which he is to be paid shall be fully protected.

*(Dr Getting presented an extended analysis of S 1318)*

DR. GETTING The changes, as underlined in this draft would bring about an expanded public health program with special emphasis on maternal and child health. The Association of

State and Territorial Health Officers has carefully reviewed Senate 1606 It is in principle in favor of title I of this bill which authorizes grants in-aid to states to extend public health services, to increase maternal and child health services and to provide medical care for the needy It is naturally desirous of supporting a bill which seeks to promote the development of public health and which would make essential preventive diagnostic and curative medical services available to every one However the association does not believe that the passage of this bill in its present form would insure this objective

*(Dr Getting offered resolutions amending S 1606)*

Title I, Part C, Grants to States for Medical Care of Needy Persons The association believes that the medical care of persons otherwise unable to procure such care is a governmental responsibility However, we believe that such a program should be administered by the state health departments, as outlined in the suggested amendment of Senate 1318 The addition of the male adult and the woman who is not pregnant to Senate 1318 would in effect create a complete medical care program Moreover, it is the opinion of the association that the federal agency responsible for the administration of a federal grant-in aid program for the medical care of needy persons should be the U S Public Health Service until such a time as a federal department of public health is created. We believe that the placing of this responsibility in the Social Security Board on the federal level and in the departments of welfare on the state level would create undesirable duplication, inefficient administration and considerable confusion in the minds of the public—all of which would tend to make medical care unavailable to those for whom it is intended It is the opinion of the association that the inclusion of cash payments to individuals is not apt to result in any improvement in the public health Benefits should be in a service basis rather than on a cash basis

Title II, Prepaid Personal Health Service Benefits This is compulsory health insurance and would to a large extent duplicate some of the benefits under Senate 1318 and under section C of title I The reading of this bill, throughout its various titles, leads us to the conclusion that it has failed to present a coordinated program either of public health or of medical care. Certainly the passage of either Senate 1318 or of part C of title I S 1606 and the simultaneous passage of title II would lead not only to duplication but to an intolerable state of administrative confusion. It is therefore the recommendation of the Association of State and Territorial Health Officers that before undertaking any expansion of a medical care program or any compulsory health insurance program a detailed study should be made as to the necessity for and the requirements of a comprehensive public health program. This should be established before a medical care program. As has already been explained, there are not enough health departments in the United States at the present time to provide adequate minimal public health services for all the people. Moreover it seems logical to try to prevent sickness and death before providing for governmental care of the sick

*(Dr Getting offered detailed criticism of S 1606)*

SENATOR MURRAY If it was left to the states, the states might have varying laws with reference to who would be entitled to practice medicine. That is true, is it not? In some places they permit osteopaths to practice just the same as medical doctors? DR GETTING That is correct.

SENATOR MURRAY And so that each state would have a different system? DR. GETTING As to the qualification of medical practice? SENATOR MURRAY Yes DR GETTING That is a constitutional right SENATOR MURRAY Also have different sets of regulations governing the manner in which the law would be administered? DR GETTING That is correct. And it is our recommendation that the states should also set up eligibility and domicile requirements SENATOR MURRAY For the profession? DR. GETTING For the recipients of any medical care program, because if the state governments are to appropriate any funds they want to make sure that they can control the expenditure of funds for the citizens of their respective states In relation to the benefits and limitations imposed on benefits as specified under the law and I am referring in general to pages 15 and 16 of my statement it is the consensus of the state health officers that those benefits should be set up by regulation and not by law, since they may have to be changed from time to time. We also are opposed to the idea of paying cash benefits to patients and believe that a service program would obtain the objective. It has been the experience that too often cash benefits given to patients are expended for permanent waves rather than for hospital or doctor bills

SENATOR DONNELL The Association of State and Territorial Health Officers, as you indicated in your statement, represents the forty-eight states, the territories and the District of Columbia? DR GETTING That is correct, sir

SENATOR DONNELL And you gentlemen have no interest in this matter except one of public welfare? DR GETTING That is our only interest

SENATOR DONNELL Doctor, as I understand it from the conclusion of your statement, you believe that the sudden overwhelming expansion as envisioned in S 1606 of a multiple medical care program, administered by numerous agencies on both federal and state levels, would not only prove too costly but be confusing to the public? DR GETTING Yes

SENATOR DONNELL So, your estimate as I understand it, which I take it is merely an estimate, for the cost of title II prepaid personal health service benefits if applicable to 105 million people would be from $7 350 000 000 per year to $10 500,000 000 per year? DR GETTING That is my estimate

SENATOR DONNELL I observe when you are quoting from the basic principles adopted by the council of the Massachusetts Medical Society on Jan 9 1946 you quote this "Provision of adequate medical care for those unable to obtain it by voluntary prepayment plans or by direct payment is the responsibility of the local or state government." Does that represent your own personal judgment likewise? DR GETTING Senator in this statement I have alluded to the Constitution where it states that the health and welfare of the people has been delegated to the state as its responsibility, in that it is not specifically delegated to the federal government.

SENATOR DONNELL In other words, you are proceeding on the theory, at least in the minds of some of the people nowadays, which seems to have been outmoded and in the minds of some of the rest of us has not, that the federal government has not been delegated any authority except that which has been conferred on it? DR GETTING That is correct sir

SENATOR DONNELL You adhere to that? DR GETTING Not only do I adhere to it, but from my experience as a city and health officer, and also working on other local levels, it has been my experience that those best able to judge the needs of the people are those who are closest to the people, and therefore any program which is intended to be national in scope, unless it is decentralized to a state or even lower level is apt to have many features about it which would not meet the needs of the people.

SENATOR DONNELL So you would not regard your views with respect to the retention of power of authority in local governments to be based solely on some technical construction of the Constitution but to be based first, on the Constitution itself the substance of it, and, in the second place, on a strong practical, sound common sense reason as you have observed in your actual practice? DR. GETTING That is right

---

APRIL 19, 1946

HONORABLE JAMES E. MURRAY, Presiding

PRESENT Senators Murray, Aiken and Donnell

SENATOR MURRAY The committee will come to order, please Yesterday we had on the witness stand Dr Low, representing the Association of American Physicians and Surgeons I wish, in connection with his testimony, to insert in the record some literature from that organization in which the organization states its position. In this literature we find the following statement

> The Association of American Physicians and Surgeons is an organization of physicians who contract and agree not to participate in systems of state medicine
>
> Therefore when a majority of the physicians of the nation become members of the A. A P S., systems of state medicine cannot be operated.
>
> The best available legal advice concurs with the validity and legality of the actions proposed by this line of reasoning Opinions of the legal counsel of the association have been made available to attorneys of medical organizations throughout the nation and there have been no disagreements with the first objective of the A. A P S to so organize ethical physicians that they may determine and enforce the conditions under which they will or will not give their services

The American Medical Association apparently does not agree with this organization, and I wish to insert in the record an article from THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, Feb 23, 1946 entitled 'The Public Relations of Amer-

ican Medicine," by Morris Fishbein, M D, Editor, THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION It contains the following statement

The American Association of Physicians and Surgeons has according to fairly well substantiated rumor received $10 from each of 6,000 physicians who have subscribed to its principles. Just what it has accomplished other than to state its objectives and to get them out in the press is not clearly apparent This group however, proposes that the physicians of the United States strike against the sick public in case the government of the United States should establish compulsory sickness insurance Such an action would be contrary to all the tradition of medical science covering the responsibility of the physician to the sick No official body of the American Medical Association has ever ventured even the thought that physicians would neglect to minister to the sick as evidence of their opposition to the law of the nation

I also wish to insert in the record some other literature showing the application forms of this Association of American Physicians and Surgeons

### Statement of Dr Edward H Cary, Chairman of the Board of Trustees of the National Physicans Committee

DR CARY My being present is the result of an interchange of seven or eight telegrams between Senator Murray and our headquarters in Chicago In answer to the first invitation we requested the privilege of having seven witnesses appear, each one of whom would briefly cover a different aspect of the problem We stated "We believe the issues involved in S 1606 are of such importance that attempts to present all phases of our viewpoint by one person at one session would be grossly inadequate"

In effect, Senator Murray replied that the overcrowded schedule of witnesses practically precluded the possibility of allowing more than one witness to appear I should like to file for the record copies of the telegrams that finally resulted in my being here

*On Tuesday evening of this week, April 16, during the discussion period after the American Forum of the Air, broadcast over a nationwide network, a proponent of this legislation stated "The National Physicians' Committee has spent one million dollars for the publication and distribution of one pamphlet"* This in some respects is a flattering statement. This amount is more than the total that has been spent by the National Physicians' Committee over a period of six years of operation Some interest has been manifested in these expenditures The committee's expenditures by years have been

| For twelve months ended Oct 31, 1940 | $150 131 29 |
| For twelve months ended Oct. 31, 1941 | $ 63 438 70 |
| For twelve months ended Oct. 31, 1942, | $ 77 657 73 |
| For twelve months ended Oct 31 1943, | $151,937 31 |
| For twelve months ended Oct 31, 1944 | $223 176 48 |
| For twelve months ended Oct 31, 1945 | $239,017 72 |
| Total expenditures six years | $905 359 23 |

During this period we received in the form of voluntary contributions from individual physicians and physician groups, $492,079 04, or 54.3 per cent of the total expenditures These came from slightly more than 22,000 doctors More than 90 per cent of other revenue came from ninety-seven business firms generally classified as manufacturing pharmacists and allied industries We have never received one dollar of contributions from any commercial insurance company

*(Dr Cary called attention to a vicious attack on the N P C in PM)*

*(Dr Cary indicated the suggestions made by N P C to meet the objectives of a health program)*

Our opposition to title II of S 1606 is based on

First, our conviction that the establishment of this kind of a system would lead to a serious deterioration in the quality of medical care for all people, rich and poor alike

Second, it would establish a core of centralized control, applying to the most sacred and vital wants of every human being which once established would require a miracle for free enterprise in any of its forms to survive.

Title II of this legislation is truly and limitlessly revolutionary in its purpose and scope.

First, it would introduce an actually revolutionary concept in social security, as we know it in the United States Under existing law, employment offices are maintained, under federal and state control, to find jobs for the unemployed Provisions are made for aid to the aged, the blind and for dependent children. Payments are made in cash To beneficiaries under the Social Security Act, compensation is paid during periods of unemployment Payments are made in cash Retirement benefits, death benefits for surviving relatives, monthly allotments for widows and dependent children are provided The *payments are made in cash The new Wagner-Murray-Dingell* bills would place in the hands of the federal government responsibility for providing medical care and hospitalization for all Social Security beneficiaries and their dependents Authority is given a single political appointee to hire doctors and establish rates of pay, to control and operate hospitals and actually to dispense medical care to 110 million people. No cash payments are involved Assuming that at least 100,000 physicians would be needed to service the plan, then in effect the federal government would establish 100,000 retail medical outlets, man them and conduct the business of providing medical care, to say nothing of dental, hospital and nursing services provided for in the bill

Second, such a move would represent a revolutionary change in our whole concept of the distribution of medical care and of medical care as such It presupposes standardization and mechanization of administering medical care. Such procedure would involve making the doctor subordinate to the bureaucrat It would mean the regimentation of the medical profession Consummation of the plans inevitably would result in absolute regimentation of the people as far as medical care is concerned. *They would be forced by law to accept such medical care as* could be provided by the politically appointed administrator or pay twice for the same service

There are few people in this or any other country, even among the supporters of this revolutionary legislation, who do not acknowledge the actual superiority and effectiveness of the type of medical care that is provided by our free and independent medical profession There are some factors in this situation that are somewhat difficult to understand but they are vital to an intelligent solution of the problem which is generally recognized

Medical care such as has been provided the American people cannot be measured by the hour, piece or pound The National Physicians' Committee has been and will continue to be in *vigorous and uncompromising opposition to entrusting to any centralized authority the responsibility for the distribution of* medical care and hospitalization for 110 million people The proponents of this legislation attempt to make the public believe that more people would secure better medical care On the basis of every experience, the reverse is the inevitable result.

I am the chairman of the board of trustees of the National Physicians' Committee and have been since the committee was organized in October 1939 I think it essential that it be known that the National Physicians' Committee for the Extension of Medical Service is exactly what its name implies It is strictly an independent committee, representing physicians throughout the United States It has many local and state groups that support its point of view

The term "patent medicine manufacturers," used by Senator Pepper, was apparently one of disdain, intended to discredit the institution of which I am a part. For the record, may I say that during its more than six years of operation not one of these so-called 'patent medicine manufacturers" has endeavored to influence the policies or point of view of the committee or exert any influence in the expenditure of its funds Actually, these firms to which Senator Pepper has referred are almost exclusively "manufacturing pharmacists" These are the institutions that gave to us for war use the sulfonamide drugs, atabrine and penicillin These are the firms which, *with mass production* technics, became a deciding factor in the saving of lives within our armed services Of them, Col Perrin H Long said less than a week ago "Their genius for organization and production should receive the highest praise from a grateful people"

A bulletin recently received from the British Bureau of Information stated "Their genius for mass production'—referring to atabrine, the sulfonamide drugs and penicillin—"became a vital factor in the winning of the war"

SENATOR MURRAY Now, are the members of this National Physicians' Committee members of the American Medical Association, also? DR. CARY Yes, sir

SENATOR MURRAY Why was it necessary for the National Physicians' Committee to take on the task of opposing this legislation? Weren't the members of the American Medical Association competent to handle that task? DR CARY I can answer that, I think, to your satisfaction Senator I am sure you remember that the President of the United States appointed in 1935 an Interdepartmental Committee for study of medical care And in 1938, in July, there was a meeting in Washington in which very few doctors were invited A great many so

called social workers and welfare workers and "do gooders," they were there in great shape and to our consternation the medical profession generally throughout the United States waked up and recognized that the greatest propaganda organization we had ever known or heard of was attempting to change the whole practice of medicine

SENATOR DONNELL What was the date of this, doctor? DR CARY July 1938. A lot of us had been interested in the welfare of the people of this country a long time, and we recognized this particular group making this particular study had a perfect right to have their own ideas and they were projecting something into the body politic of this country and had created all at once the greatest propaganda machine backed by the government that any of us had ever seen or heard of

SENATOR MURRAY That is this interdepartmental committee you have described? DR CARY When that took place It was not a great while following that until the American Medical Association was charged with criminally violating the—

SENATOR DONNELL Antitrust? DR CARY Antitrust laws Now, we are not so dumb, we doctors We have some smart folks, just like you Senators and we recognized that there was a limitation to what the American Medical Association could do under its own charter It is and was created for the purpose of education and aiding public health Now, we are independent doctors, we belong to the organization, we know all about the organization we know all about those purposes, we know all about the possibilities, but we felt there should be some means of combating the greatest propaganda machine that had ever been created affecting the welfare of the people of this country and affecting us as doctors and we proceeded to create the National Physicians' Committee, and I think, Senator, unless you pass more restrictive laws, that we have a right to our opinion and have a right to organize and combat anything we think is bad for the people of this country

SENATOR MURRAY So the limitation imposed on the American Medical Association by its charter made it necessary for them to carry on any opposition to this proposed legislation, and this fight against this propaganda machine—DR CARY You are attempting to say through us, that is what you mean

SENATOR MURRAY What is that? DR CARY You are attempting to say through us, the National Physicians' Committee I think that is what you mean SENATOR MURRAY Yes

DR. CARY I would say this, that they would be very simple minded if they did not appreciate that the doctors of this country could do independently things which they could not do themselves

SENATOR MURRAY But you are working with the American Medical Association, and you have the endorsement of the American Medical Association? DR CARY Fortunately, when the House of Delegates had a meeting I think they passed a resolution We were gratified.

SENATOR DONNELL What is the date of the resolution? DR. CARY This resolution was unanimously adopted Dec 5, 1945

SENATOR MURRAY So that your organization has the approval and endorsement of the American Medical Association and its House of Delegates? DR. CARY I would certainly be greatly disappointed if they did not approve what we were doing

(*Senator Murray and Dr Cary crossed swords sharply on the question of their personal attitudes in the hearing*)

(*Senator Murray and Dr Cary had considerable discussion on the right to deduct contributions to N P C in deducting for income tax purposes*)

SENATOR MURRAY The taxpayers of the United States, generally, find that they must know what they are doing when they are making their income tax returns and that they have no right to assume things that do not justify them in evading their taxes So I am sure that when you take this matter up with the Treasury Department you can have that matter adjusted In your statement here, Doctor, you tell about the funds that you collected up to Oct 31, 1945, making a total, you say of $905,359.23 What collections have you made since that time? DR. CARY There has been, I think, over $125,000 from the medical profession For the five months up to April 1, 1946 it has collected in voluntary contributions $246,222 82, and of this sum $162,000 was in voluntary contributions from the doctors

SENATOR MURRAY In addition to the collections that you have taken up, haw much money was spent in addition to what you have accounted for by advertising that was paid by individuals, physicians, dentists and drug stores? DR CARY Well, now, Senator, the medical profession has been disturbed very deeply about this type of legislation and they have carried on in their own way throughout the United States, not stimulated by us, but separately through the general desire to meet the situation They have carried advertisements of their own In other words, county medical societies, with some of their friends, have paid for page advertisements, and that would happen in different parts of the country I think many millions of people have read literature that was brought out in that manner

SENATOR MURRAY In other words, you prepare literature in your office and send it out to various parts of the country? DR CARY You would be surprised to know how many other people are doing the same kind of thing

SENATOR MURRAY I am not disputing that I am merely talking about your organization DR CARY Well, I think they use some of our literature, because it is pretty good

SENATOR MURRAY Here is an ad appearing in the *Daily Sun*, Goose Creek, Texas, Saturday, March 2, 1946, which has the signatures of a great number of doctors at the bottom of it. Is that literature that you have prepared? DR. CARY I have never seen it, never saw it in my life, but I do know that that has happened time and again in various parts of the country, and it is an awfully little town too, don't you know, you can hardly find it

SENATOR MURRAY You supply this literature to the medical profession, and in your statement that you gave here this morning you say that you have carried on this educational campaign? DR. CARY We think so

SENATOR MURRAY You call it an educational campaign? DR CARY We think so

SENATOR MURRAY And you have got out pamphlets and sent them across the country to the medical profession and to every one that could be reached? DR CARY Every one we hope will read it.

SENATOR MURRAY I have here some samples of your literature which I would like to submit for the record DR. CARY If you do not mind, Mr Senator, we would just submit the whole file here We have lots of them. Maybe you have not seen them We will submit the whole file

SENATOR MURRAY Let me look at them This literature goes to the medical profession and others that receive it. as you say Here is one pamphlet that you have that says "Showdown on Political Medicine," You refer to this bill S 1606 as political medicine? DR CARY That is, at least, our conception of what it leads to

SENATOR MURRAY And you also refer to it as socialized medicine? DR. CARY We think it is, if enacted

SENATOR MURRAY This literature, generally is along that line, entitled "Political Medicine and other names, such as that "State Medicine" is another name you give it. DR. CARY We are not the only ones who coin names, you know, and terms

(*Senator Murray asked for a list of all contributions of $1,000 or more*)

SENATOR MURRAY Will you also furnish for the record the other donations that you have received in sums of $1,000 or more? DR. CARY I do not know, Senator, whether you have attempted to find out from any other group that has come before you information of this kind We have bared our expenditures here.

SENATOR MURRAY Yes, sir DR CARY And we have told you what we have collected.

SENATOR MURRAY I am not asking you that DR. CARY So and so, but do you not think that you had better treat all of us alike?

SENATOR MURRAY Yes, sir DR. CARY I do not know of any other group that has come before you that has even been asked where they got their money or what they were doing with it

SENATOR MURRAY I suggested yesterday—DR CARY But when you do that, I think we ought to be all treated alike. We have bared this thing We have given you the facts there, and I think that is alright.

SENATOR MURRAY Nevertheless, Doctor, I have asked you to do this I want you to submit for the record here the donations that you have received Will you or will you not do that? DR. CARY I do not know whether that is the thing that we should do or not.

SENATOR MURRAY Well all right, I just want you to go on record as declining to give us that information DR CARY I am not declining I am just—

SENATOR MURRAY You do not know whether you will or not? DR CARY That is the point I think we have been very liberal about this whole thing

*(Senator Donnell introduced into the record an account of Dr Cary's career and encomiums on his work from the* Congressional Record)

Dr Edward Henry Cary outstanding Dallas eye surgeon and medical educator for nearly half a century was acclaimed Thursday as the outstanding citizen of Dallas during 1945 for his work as founder and guiding genius of the great medical center of the Southwestern Medical Foundation

SENATOR MURRAY I am sure, Doctor that you feel that you are well entitled to that award? DR CARY Well, I would not like to make any claims as to that, Senator What ever I have done in my community stands for itself I think you can find out about it from any citizen in my section of the country

SENATOR MURRAY You are well acquainted I am sure, with Senator Connally? DR CARY I know Senator Connally He frequently comes into Dallas I know very well the Honorable Sam Rayburn who, I think, would tell you quite a bit. I know my friend Mr Sumners, who is retiring from Congress but who is a magnificent representative from our state. I happen to know a number of other Congressmen and I think they know me and so on So I wont have to worry about what you find out

SENATOR MURRAY Are you living in Texas now or are you spending your time up here, where do you spend most of your time? DR CARY I came from Dallas up here, and I will go back to Dallas

SENATOR MURRAY You actually participate in the management of the Physicians Committee? DR CARY I am a nonpaid gentleman

SENATOR MURRAY Just a philanthropic movement on your part? DR CARY With me it is a part of the general movement —public welfare I look at it possibly a little different from you I have been engaged in medical education for all of these years and I have watched all of this thing I have been part of the evolution of medical education I have seen what the doctors have been able to accomplish in raising themselves by their own boot straps I remember well when we used to have visitation from English educators and German educators at the Council on Medical Education, and we deplored the lack of educational standards on our own part, and we gradually lifted the medical standards to such a point until we now can point with pride to them and say that the medical schools of this country are better than any other medical schools on earth And it is the kind of doctors that we are trying to turn out.

SENATOR MURRAY Before you leave the subject that you have just been discussing there, you feel that it would be of great benefit to the American people if you could succeed in defeating this effort to make available to the American people, to the fullest degree, medical care on terms that they would be able to pay for? DR. CARY Senator, we have a far better plan a far better method and less expensive one, and we think a more correct one, and we have offered what we might call suggestions here that would modify certain things that would take care of that mass of people that I think you are interested in those who cannot pay

SENATOR MURRAY When was this plan prepared that you have in mind? DR CARY Oh we have been struggling, in fact, I was a part of the development of the Blue Cross The Blue Cross has developed in my town it started there, I was given credit for it, and, as I say, it started there, and it happens among many other things, I do not want to be boastful of what I am interested in, that it is the very thing that you are interested in, except in a little different way There is possibly one of the most expansive programs of hospital service

*(Senator Donnell brought out through Dr Cary that Dr Allan Butler had recently signed another report favoring voluntary insurance)*

SENATOR MURRAY I thank you for your testimony here. You stated that in your opposition to this legislation you are not conscious of any wrongful motives in the matters pertaining to the national tax question which was raised here? DR CARY You are right, sir

SENATOR MURRAY All right. DR CARY I would like to conclude with this paper

Mr Chairman, in my prepared statement I indicated that it would require the lengthy testimony of several witnesses in order to express adequately the point of view of the vast majority of doctors on the radical and revolutionary proposals contained in S 1606, and to illustrate what I mean I should like to conclude my testimony by pointing out very briefly some of the points which I believe may be passed over during the course of these hearings, for example

1 I am sure, Mr Chairman, that should this legislation approach enactment there will be a mighty rush of the groups who desire to be excluded from its provisions The rush to get out of the bill will become so widespread that the whole compulsory health insurance program will degenerate into a simple tax on the unorganized who are unable to support and finance a lobby here in Washington to protect their interests

2 I should also like to allay once and for all the specious argument of inevitability that is being used by the proponents in an effort to stampede the Congress and the people into accepting the principle of compulsory health insurance. That is the same argument which Hitler made for his "new order" When he was warning France and Great Britain and the United States to keep hands off and permit him to have his way with the small nations of Europe There are some today who argue that free enterprise is old fashioned and outmoded, that a government controlled economy, of which political medicine is a part, must be accepted because it is "inevitable." That type of defeatism doesn't impress me in the slightest, and I don't think it impresses any American who has the gumption to fight for his grand heritage There is no change in our American form of government which is "inevitable' unless the American people, in their wisdom, determine that that change is desirable and beneficial

3 And, finally, I believe that if this legislation was submitted to the people in a referendum, with full knowledge of its implications, the voters of this country would finally and forever reject the meddling and the presumption of the bureaucrat to interfere in the sacred relationship of patient and physician, and would cast against this kind of revolutionary legislation the everlasting scorn of a free born and freedom loving people

Mr Chairman, I wish to express my gratitude for the privilege of coming before your committee as a representative of the point of view of my organization, the National Physicians' Committee for the Extension of Medical Service, which I sincerely believe to be the point of view of the vast majority of physicians

---

APRIL 22, 1946

PRESENT Senators Murray, Ball, Ellender and Donnell

### Statement of C Rufus Rorem, Ph D, C P A Director Blue Cross Commission of the American Hospital Association, Accompanied by John R Mannix, Chairman, Blue Cross Commission of the American Hospital Association

MR ROREM We are here, frankly, to espouse the cause and the interests of voluntary prepayment programs The Blue Cross Plan is a nonprofit community organization sponsored by the medical profession, the hospitals, representatives of industry, labor, welfare, government, the entire population The ordinary Blue Cross Plan, which is of course a prepayment plan for health service, costs for hospital protection about 75 cents a month per person or $2 per family Medical and surgical protection for hospitalized illness costs about the same. Typical benefits are three or four weeks' hospitalization at full coverage, with discounts beyond that period The governing body serves on a nonprofit basis, as do the trustees of any nonprofit organization All these men get for their work is the satisfaction of having participated in a community program The benefits are available in services rather than in cash allowances This is a very important contrast with commercial insurance, of course The benefits are also guaranteed under contractual arrangements with member hospitals, approximately thirty-five hundred in the United States There are eighty-six Blue Cross plans in the country at the present time. They are supervised through an approval program by the American

Hospital Association This approval program includes various standards such as nonprofit sponsorship, free choice of hospital and doctor, guaranty by the hospitals of the service and, of course, such characteristics as financial solvency and other standards of good business practice.

Blue Cross plans now protect approximately 21½ million persons Growth during the first quarter of this year exceeded our expectations approximately 1,400,000 in the three months just ended, right in the face of the strike situation, and it is particularly significant because some of the largest growth during this time was in areas where we were not able to get in the strike-bound industries Our statistics show also that even in the industrial states that have a high percentage, such as Michigan, the percentage of the population is just as high in the smaller towns and county seat cities throughout the state as it is in the metropolitan centers

SENATOR ELLENDER Might not this percentage be also due to the fact that many of those states provide facilities in the nature of charity cases just as Louisiana does? MR. OREM That is right.

SENATOR ELLENDER You have as many as six hospitals entirely maintained by the state and all of the people sick and unable to pay get the service free of charge? MR. OREM That is one of the factors, of course Two factors hold down enrolment on a state level One is the sheer difficulty of reaching the rural areas and the other is the point you mentioned, namely, it is hard to get people in the habit of paying for something they used to get for nothing That is present in any program, voluntary or governmental

SENATOR ELLENDER You say the people enrolled are 21½ million Is that exclusively Blue Cross? MR. OREM That is exclusively Blue Cross alone.

SENATOR ELLENDER What period of time has it been that high? In other words, what has been your progress? MR. OREM This last year a little over 4 million, 36 hundred thousand in the calendar year 1945

SENATOR ELLENDER Has that been your greatest advance? MR OREM The last three months are the largest three months in the history They are larger than the last year during the war, which we feel is significant. Apparently the net enrolment is growing more rapidly than ever

*(In response to questions from Senator Murray, Mr Orem gave the details of Blue Cross plans)*

SENATOR MURRAY What we are searching for is the best possible plan whereby the American people can get the modern medical care that is necessary for protecting the health of the American people If that can be done by a voluntary system, why of course, no one would want to oppose it. But the feeling is that these voluntary systems, while they are all right as far as they go, do not go far enough. MR. OREM We have some suggestions to how we think they can go further and faster SENATOR MURRAY All right.

SENATOR ELLENDER Is there any time element in your contract as to the length of time that persons can have services for the pay that they make each year or each month? MR. OREM Ordinarily there is a limit either per illness or per year But it starts again each year The typical contract at the present time is three or four weeks per year per person of what we call full coverage plus from sixty to ninety days or more of some partial discount, usually about 50 per cent of the hospital bill

SENATOR ELLENDER In the event a person should exceed that how is that person taken care of? MR OREM He is on his own until the next year starts

SENATOR MURRAY *After an operation is completed and* he is dismissed from the hospital, does he continue to get medical care at his home? MR. OREM Not under the Blue Cross contract, no

SENATOR MURRAY So that if he remained ill for some months following that and required medical care, that would be outside the plan? MR OREM That is right. I would like to read the next four paragraphs because they are discussing what we are discussing This is page 3, the second full paragraph

> The complete costs of medical care for hospitalized illness (including physicians services) represent approximately 50 per cent of the average family budget for health services. Only one tenth of the people are hospitalized in the course of a year Yet 10 per cent of the individuals bear 50 per cent of the load for the costs of medical care to the employed population and their dependents
>
> Which is the more important in the first instance, to cover the 50 per cent of the sickness costs which represent the small bills paid by 90 per cent of the population or to cover the 50 per cent of the costs loaded on the 10 per cent who suffer a serious illness requiring hospitalization? There is no clear cut answer in principle they should have everything but administrative considerations are important
>
> Access to the facilities and personnel of a good hospital is itself a form of prevention It removes the economic barrier and encourages the subscriber to seek early treatment and attention
>
> It is desirable of course that patients have early and easy contact with general practitioners and specialists Yet it has proved very difficult to initiate and administer such benefits unless both subscribers and practitioners are thoroughly familiar with their rights and responsibilities The problems of administering the benefits for a minor illness are more complex than for a catastrophic illness Legislation alone will not remove the practical administration difficulties nor will it provide the facilities essential to a comprehensive prepayment program of health service.

The point I wish to make is that maybe we are too much occupied with the administrative practicalities of a prepayment program, but we live with them every day and are inclined to appraise proposals in terms of whether or not they will work Maybe we get pessimistic, but we know that administration is difficult. It is not difficult to demand that somebody else do something, but sometimes it is difficult following through I suppose a member of Congress knows that better than we

SENATOR ELLENDER Under your plan who determines whether or not a person is entitled to hospitalization? MR OREM The doctor

SENATOR ELLENDER What influence have you over that doctor if any? MR. OREM Moral influence only

SENATOR ELLENDER Is he paid by you or by the patient? MR OREM No In a prepayment plan, just coming out of prepayment for medical care, for hospitalization, of course, the hospital is paid by the Blue Cross Plan For a medical plan they would, if the plan went with it, pay the doctor directly by the medical plan

SENATOR ELLENDER So that your plan is to have hospitalization as one factor and then— MR. OREM Medical care for hospitalized illness for the next, and, the third, comprehensive care in the home and in the office.

SENATOR ELLENDER All of that could be combined into one policy? MR OREM That is right.

SENATOR ELLENDER Or take either of these three policies MR OREM Yes It might be done but ordinarily the public demand starts with the hospitalization. Second medical care for the catastrophic illness and, third, home and office.

SENATOR ELLENDER Do you propose to cover that phase of the plan dealing with the payment of doctors bills? MR. OREM Over *half* of the eighty-six plans are now coordinated with such a program for doctors Louisiana happens to be one

SENATOR ELLENDER Who selects the doctors? MR. OREM The patient

SENATOR ELLENDER The patient. Are they paid out of a regular stipulated fee by you or whatever they charge? MR. OREM There are two kinds of prepayment plans for medical care. They are really modifications of one type. First of all, they are paid by the plan, not by the patient. Second, the benefits which are paid to the doctor are stated amounts A fee schedule Now, for people below certain income groups in some of the plans the doctors agree that they will not charge more. Some of the plans are on what is called an indemnity basis and *only* protect the patient as against the doctor charging more Either the doctor does or does not In introducing this phase of the plan a few years ago a so-called indemnity basis of paying physicians many people in perfectly good faith would ask "How do I know that the doctor will *not* charge any more?' One simple and straightforward reply to that question is 'Ask him" When they ask the physician if he is going to charge more, it is amazing how many of them take the position that it was a reasonable amount in view of the fact that they were getting it regularly from every person

SENATOR ELLENDER In fixing these fees, do you have a regular fee rate applicable to all communities or does it vary in localities? MR. OREM On the statewide plans they operate throughout the state as a standard set of fees There may be as many as one hundred different items on the list For local plans, within a state, they may be different New York City has four different plans which are slightly different in the payments

SENATOR ELLENDER Do you have any method of employing certain groups of physicians to do your work? MR. OREM No

SENATOR ELLENDER It is left entirely to the patient? MR. OREM That is right.

SENATOR ELLENDER However the doctor must abide by whatever fee system you establish? MR. OREM That is right

SENATOR BALL I have been a member of the Blue Cross since it was first organized in Minnesota, and it has done a marvelous job there Could you tell us what percentage of hospital beds in the country are participating in the Blue Cross Plan

MR. OREM About 80 per cent of the general hospital beds under nongovernment auspices That is a low estimate. I thought you were going to ask this What percentage of hospital beds are occupied by Blue Cross patients? This ties in very closely with the whole question of need for hospital facilities The one thing that happens to be clear is that Blue Cross plans are not filling the hospitals. In your state and in Buffalo and St. Louis, where spot checks have been made, and in Cincinnati, the number of Blue Cross subscribers in the beds of those towns on any given day was smaller percentage-wise than the percentage of the people enrolled. The people get in earlier and get out earlier More people go, but they do not stay so long

SENATOR BALL What percentage of your subscription funds goes for administration expense? MR. OREM I am awfully glad you asked that, because that is way down at 12 per cent. On the average, in the United States, 12 per cent goes for all types of overhead cost, administrative expense In some of the plans it is considerably lower In Baltimore, for example, 9 per cent In Cleveland, less than 8 per cent. It is higher in the areas where the population is more widely scattered and it is also higher in the early days of organization Of this 12 per cent, on the average, 3 per cent is used for consumer education and what we might call promotion, the entire salaries of the field representatives The other 9 per cent is for accounting for keeping track of eligible persons and paying hospital bills One out of three of these families involves a case each year, which means a lot of record keeping

SENATOR BALL A lot of bookkeeping? MR. OREM A lot of bookkeeping But, nevertheless it is approximately 12 per cent About 7 per cent this past year went to a reserve for the payment of date bills and 81 per cent was paid out in cash, currently for hospital payments Approximately 129 million revenue, 105 million hospital payments, and it would be about 8 million to reserve this year

SENATOR BALL This 21 million I take it that are covered, includes the family MR. OREM Yes, it does include the family

SENATOR BALL And that is growing pretty fast? MR. OREM There is no evidence of any slowing up at all Some of the plans have had net deductions following V-J day and are now increasing very rapidly

SENATOR ELLENDER Reverting to your method of fixing fees, do you have much difficulty among the doctors of a community as to the schedule of fees you agree to pay MR. OREM It is their committee that sets these up

SENATOR DONNELL Does the person organizing the plan organize it in a corporate form or a noncorporate form, or what is done actually MR. OREM You are right in your statement that a plan is the association

SENATOR DONNELL Yes MR. OREM In every instance it is the corporation A nonprofit corporation organized under the laws of the state

SENATOR DONNELL Of the state where it is located MR. OREM Of the state where it is located. In most areas it is organized under special enabling legislation which brings it under the supervision of the department of insurance for purposes of determining subscription rates benefits payment to hospitals and other administrative and financial features of the program

SENATOR DONNELL Suppose that public spirited citizens in the city of St Louis decide to organize a plan and they organize it under the corporate laws of the state of Missouri as the St. Louis Plan No 1 Does the St. Louis Plan No 1 become affiliated with some other plans either in the state of Missouri or elsewhere? MR. OREM Each plan is a separate legal and administrative entity, but under the Blue Cross Commission, of which I am director, we now have administrative arrangements by which transfers can be made of membership from one plan to another with a minimum of administrative routine also arrangement for providing out of town benefits when a person is traveling, by which a Blue Cross plan furnishes service. Let us take St. Louis as an illustration. Suppose St. Louis Hospital had a subscriber from Chicago That subscriber would contact the St. Louis Hospital, where he needed to be cared for The hospital would contact the St. Louis Blue Cross Plan, which would handle that subscriber just as if he lived there. They would handle the arrangements and collect from Chicago These are administrative arrangements

SENATOR DONNELL What is the approximate annual income that comes into the Chicago office from these various eighty-six plans MR. OREM Our budget for this year is $124 000 SENATOR DONNELL I see. MR. OREM About one tenth of 1 per cent.

SENATOR MURRAY Doctor I believe you indicated that a group of public spirited citizens in any part of the country could get together and organize one of these Blue Cross plans? MR. OREM That is right.

SENATOR MURRAY After they organized it, then they are in control of it Do they manage it and determine the manner in which it shall operate or how is that handled? MR. OREM That is true. Some of the plans have arrangement by which the general public may have voting procedures to elect such people, even the subscribers It has not been administratively so very practical, for this reason, that usually when the vote is taken in one city 25,000 people are eligible at that time, or about 150 000 are eligible to vote, but they do not all vote or come to the meeting They find it difficult to do so, and the nominees presented by a nominating committee of subscribers are elected, which is often the case. They represent the subscriber interest, the public interest. That is likewise true in the judicious and equitable selection of the people for the boards

SENATOR MURRAY How are they selected by the members? MR OREM Typically by the board. They are what are commonly called self-perpetuating boards

SENATOR DONNELL How do they start? Who determines the initial membership of them? MR. OREM It is determined, I suppose, by the strength of the personality of the organizing committee. In some states it is determined by law Colorado, for example, requires that it shall be one third general public, one third representatives of hospitals and, if there is a medical plan involved, one third representative of the medical profession.

SENATOR MURRAY As a practical matter, in the eighty-six plans developed are the boards that manage those plans made up of consumers largely representative of the hospital and the medical profession? MR. OREM On the arithmetic of that, and depending on the use in which you define the terms I would say that a large percentage have some direct connection with hospitals as trustees or for that matter as administrators

SENATOR MURRAY In any of the eighty-six plans that are in existence, is there a board or directors that is made up exclusively of the consumer? MR. OREM One plan, Cleveland which has the highest percentage of enrolment, has no hospital superintendents It has hospital trustees which is primarily hospital trustees, no hospital administrators The same thing was true until recently in the state of Connecticut. The same thing is true on a small plan in Decatur, Ill., in which the dominating factor is the local credit union

SENATOR MURRAY The great problem we have in this country is to make medical care available to the great masses of the people who have heretofore felt they could not afford to consult a doctor MR. OREM That is right.

SENATOR MURRAY If we had a system of that kind in operation in this country it seems to me we would have less hospital cases MR. OREM That is right. SENATOR MURRAY Because it is neglect that builds up the ill health of the country and makes it necessary for hospital operations in the final end MR. OREM That is right.

SENATOR MURRAY So it seems to me that the Blue Cross Plan is effective in that respect, because it does not at the present time cover that situation. MR. OREM Well I am interested to hear you say that, because among our suggestions are ways in which we believe the federal government can be of genuine help to volunteer programs Seven years ago we were very proud, and critics and friends were proud when we had 1 million members Now we are apologetic for having only 21½ million, and our critics and friends are apologetic

that we have not done more We are definitely concerned in anything that will make the present service expand both in its coverage of the type of care and in the number of people

SENATOR DONNELL Has there been any unfortunate experience with any of these Blue Cross plans where there has been defalcation or bad judgment, and money all used up, and the concern ultimately prove unable to meet its obligations? MR. OREM Oh no There have been a very few petty defalcations as in anything, but it is interesting to know that in a special study by the bonding companies, because Blue Cross had thought that they were paying too much for personal bonds, revealed the fact that it was possible to write bonds on Blue Cross subscribers at about 50 per cent of what had been charged up to the present time.

SENATOR DONNELL Do you not think that, if there had been any states in which there is not governmental supervision guaranteeing proper bonding and other protection for the subscribers, it is important that legislation of that kind be had in the states? MR. OREM Oh, very much so

SENATOR DONNELL To guarantee local supervision and along the lines that I have indicated MR OREM The interesting thing, however, is that the local boards of trustees routinely impose much stricter standards on themselves because of their own local reputation than the state regulatory bodies have done SENATOR DONNELL I can see that likelihood MR. OREM And from our office, for example, our recommendation with regard to adequacy of reserves, in every instance the recommendations of our committees have gone beyond the requirements of the local state insurance departments

SENATOR MURRAY I think that it is the natural disposition of the American people not to be classified as paupers but willing to pay That is the reason this agitation is developing in the country, a lot of poor people who cannot afford to pay the high prices are anxious to find some kind of a national insurance system which would enable them to come in and pay for their medical care. MR OREM That is right. SENATOR MURRAY And not be accepted on the basis of being impoverished

MR. OREM Employer contribution is becoming the characteristic of Blue Cross participation. That reduces the cost to the worker himself The problems of adverse selection are being brought under control I will not dwell on that but in the early days we used to settle for a low percentage of enrolment. The self-respecting policy of demanding high percentage of participation is the regular thing It improves the selection among the people, so instead of getting all the potential hospital cases we get them as well as the rest of the people. A voluntary plan must make sure that the revenue exceeds the expense

SENATOR MURRAY What health examination do you give an applicant? MR OREM None whatever

SENATOR MURRAY Any ordinary citizen can walk in and join this organization? MR. OREM That is exactly what he cannot do an ordinary citizen cannot walk in off the street. He must join through his place of employment, which is the way to improve the selection of people and get the group enrolment. Let me say that an increasing number of the plans now however, are supplementing their group enrolment, and group enrolment in this does not mean what it does in a commercial sense It means three or five or ten it means that number of people. Those same plans now have periods during which people who are in still smaller groups may enroll but a man cannot come in when he pleases He comes in when the administration pleases thus avoiding the adverse selection of getting people who are incipient hospital cases

SENATOR DONNELL Don t you accept members under these plans in some instances from a bar association? If a man belongs to the bar association he may obtain membership by reason of his membership in the association? MR. OREM That is thought of as a group and even their enrolment is scheduled. It is not casual There are certain dates by which members must make up their minds and if they do not decide, they wait until a period later to be determined.

SENATOR DONNELL I was contrasting that type with the one originating at the place of employment. MR OREM At the place of employment? SENATOR DONNELL Yes MR. OREM There are those. For economic purposes that is the same thing The same thing holds true of a farmers cooperative particularly if a producer, such as a milk cooperative or a fruit cooperative, there it is frequently withheld from the monthly check.

SENATOR MURRAY Could any group in the community, organized group, as for instance the bar association, or the different organizations, like the women s professional clubs, could they make application and every member of their organization be entitled to be accepted? MR OREM Yes

SENATOR MURRAY That would be true of unions too, for instance, the Bartenders Union? MR. OREM Typically the unions wish to handle it through their place of employment, through a checkoff directly from the employer, but in particular the craft unions, of which the one you mentioned would be an illustration

SENATOR MURRAY I do not mean that particular one, just any one. MR. OREM The hotel employees in New York, for example, are all members The dues, I say, are paid by the hotels, but nevertheless they are all members

SENATOR MURRAY As a general rule a group employed in a New York hotel would be considered a pretty fair risk MR. OREM I do not know anything about their payments It is behind closed doors and I do not know what goes on in the kitchen They do all right on the floor This point Senator Donnell mentioned, there is coordination in service to the enrolment areas of the Blue Cross in various ways The scope and content of a voluntary plan are necessarily affected by the economic level and available facilities of the community in which the subscribers are enrolled. More comprehensive benefits are available in communities with high income levels especially industrial centers where there are sufficient hospital beds and diagnostic equipment. These variations permit the establishment of higher standards, which may serve as examples in areas where the social consciousness of the population has been most fully developed This variation suggests the ultimate possibility of equalization in service through the use of local state or national government funds But the differences of income levels and living standards have many causes and will not be offset by merely introducing a prepayment health program

SENATOR MURRAY Let me ask you there any community where the facilities are not up to a high standard and a member in Blue Cross Plan wished to be sent to another community for a particular operation would that be covered in your plan? MR OREM Yes

SENATOR DONNELL One sentence I am not clear on as to what you mean in referring to the ultimate possibility of equalization in service through the use of local, state or national governmental funds Am I to understand that you look with favor along the line of the use of governmental funds for the purpose of financing the treatment of people? MR. OREM One of my recommendations with which this testimony closes is the approval of the principle of federal grants in aid to state approved voluntary programs to enable the establishment of low subscription rates to people in the low income groups

SENATOR DONNELL Do you advocate a plan of compulsory health insurance as distinguished from the grants in aid plan? MR. OREM No this would be a grant in aid plan a federally approved program for voluntary organizations

SENATOR DONNELL What you are referring to here with an inference of approval is a plan of grants in aid to local subdivisions perhaps state or even a lower level of governmental subdivision and you are not advocating as I understand it by this sentence the creation of a compulsory health insurance plan Am I correct in my understanding? MR OREM You are entirely correct In fact, I would go further and say that not only are we not advocating it but we would regard that as a last step to take, from our point of view at the present stage of the organization of health service as a premature step Blue Cross protection and other kinds of voluntary programs are actually going into wage agreements as a part of the terms of employment. That is a very important factor at the present time. In other words organized labor, which frankly sponsors and supports Senate bill 1606, takes the position that they are also worried about whether they are going to be sick tomorrow or the next day or the next. Here is a chance to get something good immediately on a basis that is sound The largest employer in the United States the federal government, does not yet permit the privilege of voluntary payroll deduction. The Blue Cross Commission office receives letters daily from units of the United States government asking for the privilege of protection. Yet there are only 300,000 federal employees and their dependents participating

in voluntary plans because of the difficulties involved in handling organization and payment details through voluntary group leaders who are employees of the federal government. Mutually satisfactory arrangements are not possible without the privilege of payroll deduction. Undoubtedly the existing makeshift enrolment and collection procedures have in many instances proved to be inefficient for the government departments involved as well as for the plans

I would say that our enrolment of federal employees is up to now approximately 300,000 and is something like the dog walking on his front legs You are not surprised that he does not do it better You are amazed that he can do it at all I am really surprised that we have as many as 300 000 federal employees now through group leaders voluntary collectors, sending their money in, or somebody walking around and asking for $2 a month Yet there are about that number Payroll deduction on a voluntary basis if authorized in writing by the individual, on groups composed of divisions or departments or bureaus, would make it easier for those who want such protection to get it

SENATOR MURRAY You find in many of the big industries of the country they are coming to agreement on this problem of payroll deductions? MR. OREM Not only that if they do not come to such an agreement at the present time they do not join the Blue Cross In other words Blue Cross is now coming to the policy which was established years ago by commercial insurance companies of demanding payroll deductions and which course is recommended in any program including the one in Senate bill 1606 Payroll deduction is absolutely necessary to economy and to maintenance of membership and general efficiency Overhead costs in my opinion have been remarkably low considering the rapid rate of growth Active sponsorship and encouragement of Blue Cross by federal state and local governments can reduce costs to subscribers and increase the membership throughout the country Certain Department of Agriculture experiments were mentioned in these hearings and were described as disappointing It was stated that among a group of low income farmers only 40 to 50 per cent of the eligible families took advantage of the privilege of voluntary prepayment for medical and hospital benefits even though the federal government participated in the cost of the program. Initial participation in a voluntary plan by 50 per cent of low income farmers is encouraging Farmers are the most individualistic and independent minded part of our entire population Many have solved their problem of health service by going without the necessary care If such an experiment was conducted in an urban community among a group of low income workers in an industrial plant, probably 85 to 95 per cent of the employees would have enrolled. Many of the Blue Cross plans have increased their benefits during their period of operation without corresponding increase in subscription rates to the beneficiary The increased benefits have been made possible through better 'selection' among subscribers and decision to apply reserves to provision of immediate benefits Blue Cross plans are, of course concerned with providing protection for all costs of hospitalized illness Voluntary plans have been accepted by many veterans as a genuine opportunity for family protection. Blue Cross has thrown down the bars of group enrolment as a patriotic gesture for the enrolment of the veteran, and beginning next month, in about ten days there will be a one month campaign by which veterans will be completely exempted from the group requirements for Blue Cross enrolment. Some of the plans are already doing so I have been surprised at the acceptance in Philadelphia, for example, and in Cleveland literally thousands of veterans who are entitled to G I benefits are enrolling and for two reasons first, there it gives them free choice of doctor and hospital, and, second, they recognize that the veteran himself is only one fourth of the total cost in hospitalization The wife and children represent three fourths of the total cost. Blue Cross plans have been recognized by government agencies as administrative units for the provision of benefits The Veterans Administration has asked Blue Cross to serve as a clearing house for it in providing service connected benefits but not non-service benefits That is just starting We do not know how well it is going to work. The Veterans Administration likes the idea, and we hope that it will be a genuine service to the public. Of course that is not what the Blue Cross plans were created for, to serve as a service agency for any other organization, but they can do it. I hope you will bear with me if I just say a word about Europe. I think a lot is said about Europe, both as a matter of history and otherwise. I would like to make a comment because I have been there and I have talked to the people who have administered the plans, and I would just like to make this one comment.

It seems to me that there is very little affirmative suggestion and recommendation that can come from the experience there The voluntary subscribers in America at the present time in their total are as many in their total as in Netherlands, Belgium, Norway, Denmark and Finland all put together, and Blue Cross plans alone have more members than the entire population of all the Scandinavian countries which are very civilized organizations I am a Scandinavian myself I do not think that just because a compact small organization, a small country, has had certain experience it means that we would have the same in the United States We might. But here is the real point I want to mention, because it comes up in connection with voluntary health insurance generally In England in 1911 there were small mutual benefit societies formed all through the country They had to be scooped up into the national health insurance act, and I understand that they are still living with the administrative complexities of those plans Some were for all practical purposes private ventures In the United States that is not true. The largest movement in the country is one with a large number of members, each operating unit ranging on the average of more than 200,000 participants but only eighty-six in the entire country, and there ought to be less I think seventy-five would be plenty They are all coordinated and not disjointed and are a network or foundation for a real public service.

Another angle about the European situation in health insurance is this, that at the times when health insurance really began to expand, hospitalization was already tax supported except in England. In the krankenkassen, to mention Germany before the war—and the same thing is true in Norway and Denmark—the amount which the health insurance funds paid to the hospitals for a few illnesses made no pretense of covering the cost of the operation of those hospitals They were city or county institutions or local institutions with salaried doctors, and it made no pretense of covering that We are considering this at a time when the ordinary American thinks of health as a personal problem to be handled in some sort of joint action This is one of the few countries where a man still thinks his health is somewhat his own responsibility

I would say that in England there is a voluntary program called the contributary scheme. That was set up not to relieve the patient but to relieve the taxpayer In other words, the whole movement behind the prepayment in the European countries was to give the taxpayer a break. That is an honorable motive also It was quite different here, where it is to relieve the individual patient who might need care In England in that pattern the only difference was that most of the charity work was done in what we call voluntary hospitals supported by well to do people who are not allowed to use the hospitals

SENATOR DONNELL You mentioned something about the number of plans eighty-six you thought we might well get along with seventy-five. I would like to know just as a matter of interest in my own state. By your table I see there are two such plans in that state Would you be kind enough if you happen to recall, to tell us for the record and for our information what parts of the state, or what proportion of the state of Missouri is covered by those two plans? MR. OREM St. Louis handles everything except about fourteen counties in northeast Missouri, which are handled out of Kansas City

SENATOR DONNELL Is the entire state of Missouri covered by those two plans? MR. OREM Oh, yes That is in different degrees of intensity of course.

SENATOR DONNELL Take a man in Hannibal, Mo take St. Louis you are familiar with that Suppose a man wants to join Blue Cross He belongs to the bar association Is that the same Blue Cross that the man who works for the Rice Dry Goods Company joins in St Louis? MR. OREM The same one the same organization

SENATOR MURRAY And the state of Missouri, I notice, has a population of 3 524 790, and your membership enrolment in your plan there is 795 819 MR. OREM Yes

SENATOR MURRAY That is what proportion? MR. OREM 22 6 per cent.

SENATOR DONNELL Actually over this particular state, Mr Orem, what proportion would you say, roughly, of the

795 819 are outside of the two larger cities, St Louis and Kansas City? MR ROREM Not a very large proportion

SENATOR DONNELL Are you able to tell us how many hundred thousand in round figures belong in St Louis and Kansas City? MR ROREM I would be surprised, if you take the two trading areas of Kansas City and St Louis, that more than one fourth of them were outside those two areas I would say about that, maybe as much as one third

SENATOR DONNELL I do not understand that MR ROREM Those two towns represent a million and a half out of the state population, that is, out of the 3,600 000 Those two towns would represent a third of the population They probably have from one half to two thirds of the total enrolment The point is, there is greater concentration in the urban areas as a rule because of administrative difficulties in reaching people outside those areas up to now

SENATOR DONNELL How about the farmers in my state? Are they joining the Blue Cross in any considerable numbers? MR ROREM Not doing as well as they are in Iowa or in Kansas or in Minnesota, but I would say in considerable numbers

SENATOR DONNELL How about the miners, the lead miners for instance? MR. ROREM That I cannot answer The miners are joining in western Pennsylvania and elsewhere We hope they will be joining in Montana before long Incidentally, Senator you will be interested if you will look at the figures for Montana lately to know that of the 31,000 now more than half have been taken in within the last year through the revitalized management of the organization there

SENATOR MURRAY It is only in recent years that the question has taken hold? MR. ROREM That is right It is accelerating now There used to be a statement, and I remember very well when it was made by a person who was not really administering Blue Cross, that the first 10 million are the easiest From now on it will be difficult It proved the other way round.

### Statement of Mr John R Mannix

SENATOR MURRAY When the Blue Cross plans first began, were they met with skepticism by the medical profession? Did they oppose them at first?

MR MANNIX I would say that that varied in different parts of the country I happen to have been in Cleveland at the time and a great deal of the support that we got was from the Cleveland Academy of Medicine and from a Dr Follansbee, who is one of the officials of the American Medical Association at the time It is true that the members of the American medical profession in certain areas did oppose them It is true that hospitals did oppose them It is true that many employers opposed them It is also true that the public did not support them very much, and we had a problem of education with all four groups Now we are enrolling about every five days as many people as we enrolled in the first five years

SENATOR MURRAY Do you think that if the Blue Cross undertook to give the same coverage as the bill here pending, that is to say, complete medical and home care and office care, and everything pertaining to medical care, do you think that the medical profession would approve the Blue Cross system if it went that far? MR MANNIX I definitely feel that it would

MR. ROREM I would like to say one thing here, because it is worth mentioning We have spoken of Blue Cross as if it was a corporate entity in every instance that provided the medical care That is not the typical arrangement. The medical care is provided through a parallel organization administered by the same employees as Blue Cross However in a few instances Delaware, North Carolina, Louisiana and a few states and others like that one corporation offers complete health service, which is, and I speak now as an administrator as opposed to a social philosopher, preferable.

SENATOR MURRAY Where is that organization? MR ROREM It is just that the Blue Cross Plan has authority to offer complete medical care in New York Delaware West Virginia Louisiana and I think New Hampshire and Vermont.

MR. MANNIX It is about to start there

MR. ROREM And in Rhode Island it will start on that basis

SENATOR MURRAY Of course it would be impossible for the very low income groups in the United States to avail themselves of that system I mean to say people who are earning less than $1,200 a year MR. ROREM It depends on whether the employer participates We assume that with the expansion of this larger plan there will be employer contribution That is taken for granted

### Statement of Dr Alice Hamilton

DR HAMILTON I am representing the Consumers League, Mr Chairman, and I might explain that that is a league founded by Florence Kelly in the early years of the century, of consumers, in order that they might investigate and do what they could to remedy the conditions of the workers whose goods they consumed That means that we have had a great interest in all the laws governing labor, especially child labor and the minimum wage, and as one cannot study any group of working people without realizing how large a part sickness plays in their difficulties, we became interested early in compulsory health insurance and passed three resolutions which I will not read, but which I might just leave for the record

Why does the league take its stand in strong support of S 1606?

*(Dr Alice Hamilton favored 1606 in toto with Senator Pepper's amendments)*

*(To be continued)*

## Coming Medical Meetings

American Medical Association San Francisco July 1 5 Dr George F Lull 535 N Dearborn St Chicago 10 Secretary

American Academy of Tuberculosis Physicians San Francisco June 30 Dr Oscar S Levin P O Box 7011 Denver 6 Colo Secretary

American Association for the Study of Goiter Chicago June 20-23 Dr Thomas C Davison 478 Peachtree St. N E Atlanta 3 Ga., Secretary

American Association for the Surgery of Trauma San Antonio Texas June 26-28 Dr Gordon M Morrison 520 Commonwealth Ave Boston Secretary

American Association of Genito Urinary Surgeons Stockbridge Mass June 20-22 Dr Charles C Higgins 2020 E 93d St. Cleveland 6 Secretary

American Association of Plastic Surgeons Toronto Canada June 3-4 Dr Frederick A Figi 102 Second Ave S W Rochester Minn Secretary

American College of Allergists San Francisco June 28-30 Dr Fred W Wittich 401 LaSalle Medical Bldg Minneapolis 2 Secretary

American College of Chest Physicians San Francisco June 27 30 Mr Murray Kornfeld 500 N Dearborn St Chicago 10 Executive Secretary

American College of Radiology San Francisco June 29 Mr Mac F Cahal 20 N Wacker Drive Chicago 6 Secretary

American Dermatological Association Hot Springs Va June 10 14 Dr Harry R Foerster 208 E Wisconsin Ave. Milwaukee Secretary

American Medical Women's Association San Francisco June 29 30 Dr Beulah Cushman 25 E Washington St. Chicago Secretary

American Neurological Association San Francisco June 26-28 Dr Henry Alsop Riley 117 E 72d St. New York 21 Secretary

American Ophthalmological Society San Francisco June 26-28 Dr Walter S Atkinson 129 Clinton St Watertown N Y Secretary

American Orthopedic Association Hot Springs Va., June 27 29 Dr Charles W Peabody 474 Fisher Bldg Detroit 2 Secretary

American Physiotherapy Association Black Mountain N C June 16 22 Miss Margaret A O'Neill 1790 Broadway New York 19 Secretary

American Proctologic Society San Francisco June 30 Dr Harry E. Bacon 2031 Locust St Philadelphia 3 Secretary

American Radium Society San Francisco June 28 29 Dr Edward H. Skinner 1103 Grand Ave Kansas City 6 Mo Secretary

American Society of Clinical Pathologists San Francisco June 27 30 Dr A S Giordano 531 N Main St South Bend Ind Secretary

American Urological Association Cincinnati July 22 25 Dr Thomas D Moore 899 Madison Ave Memphis 3 Tenn Secretary

Association for the Study of Internal Secretions San Francisco June 28-29 Dr Henry H Turner 1200 N Walker St. Oklahoma City Secretary

Idaho State Medical Association Boise June 17 20 Dr T B Jeppesen 105 N 8th St Boise Secretary

Maine Medical Association Poland Spring June 23-25 Dr Frederick R Carter 142 High Street Portland 3 Secretary

Montana Medical Association of Great Falls July 18 20 Dr Raymond F Peterson 9 W Granite St. Butte Secretary

National Gastroenterological Association New York June 19 21 Dr G Randolph Manning 819 Broadway New York 23 Secretary

National Tuberculosis Association Buffalo N Y June 11 13 Dr Charles J Hatfield 1790 Broadway New York 19 Secretary

New Mexico Medical Society Santa Fe June 6-8 Dr L. B Cohenour 221 W Central Ave Albuquerque Secretary

South Dakota State Medical Association Aberdeen June 1-4 Dr Roland G Mayer 22½ S Main St Aberdeen Secretary

# Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST SUCH AS RELATE TO SOCIETY ACTIVITIES NEW HOSPITALS EDUCATION AND PUBLIC HEALTH)

## ALABAMA

**Change in Health Personnel**—Dr Sidney J Williams has been named health officer of Sumter and Greene counties with headquarters in Livingston, succeeding Dr Robert D Spratt, Livingston

## ARKANSAS

**State Medical Election**—Dr Lorenzo T Evans, Batesville, was chosen president-elect of the Arkansas Medical Society at its meeting in Little Rock April 15 17 and Dr Henry K Wade Hot Springs National Park was installed as president Other officers include Drs John Hayes Little Rock, Walter G Eberle, Fort Smith and Homer A Stroud Jonesboro, vice presidents, Dr William R Brooksher, Fort Smith secretary and Dr Paul L Mahoney Little Rock treasurer The 1947 session will be held in Little Rock in April

## CALIFORNIA

**Fellowship in Pharmacology** — The Winthrop Chemical Company has established a fellowship in pharmacology at Stanford University School of Medicine Stanford University, to be available to qualified medical graduates or those who have finished the fourth year in medical school for training in research and teaching in pharmacology in the department of pharmacology and therapeutics at Stanford University The Winthrop fellowship amounts to $1,800 a year Applications should be made to Dr Paul J Hanzlik Department of Pharmacology Stanford University School of Medicine 2398 Sacramento Street San Francisco 15

**Expansion of Permanente Foundation Hospital**—On May 10 the Permanente Foundation Hospital, sponsored by Mr and Mrs Henry J Kaiser announced that a $100,000 construction program had been started to increase the capacity of its hospital and outpatient facilities in Oakland Construction plans call for an entirely new obstetric and gynecologic department, consisting of waiting rooms, doctors offices and examining rooms, a new dental suite consisting of six dental rooms and x ray equipment and a new enlarged pharmacy These changes will also permit the development of a new pediatric outpatient department

**Personal**—Dr George H Houck on terminal leave, M C Army of the United States has been appointed director of student health services at Stanford University, Stanford University He will direct the student health program, which combines the present separate services for men and women into a complete medical care according to the Oakland *Tribune* —— Dr Cyril M MacBryde, formerly of St Louis, has been appointed assistant clinical professor of medicine at the University of Southern California School of Medicine, Los Angeles ——Dr Francis M Pottenger, Monrovia one of the founders of the first antituberculosis society in California, was named to the newly created office of president emeritus of the Los Angeles County Tuberculosis and Health Association at the recent meeting of the organization

## CONNECTICUT

**Institute of Occupational Medicine and Hygiene**—The proposed establishment of an Institute of Occupational Medicine and Hygiene at Yale University School of Medicine, New Haven is discussed in the *Connecticut State Medical Journal* Since a campaign was launched in 1945 to obtain funds for the project Connecticut industry has contributed about $100,000, assuring the development The plan calls for the organization of a division or institute in the medical school whose members should be drawn from or have liaison with several departments, including the departments of public health internal medicine and its section of preventive medicine, pharmacology and toxicology, and surgery In addition it is anticipated that the school of nursing and other departments and schools of the university will participate The committee on industrial medicine of the Connecticut State Medical Society is actively cooperating in the project, the immediate objectives including the training of medical students and industrial physicians based on the fact that occupational medicine and hygiene is now a specialty, special postgraduate instruction, research in occupational medicine and hygiene, and consultation

## DISTRICT OF COLUMBIA

**Charles Stanley White Retires**—Dr Charles Stanley White recently retired as professor of surgery at George Washington University School of Medicine, ending forty five years' service on the faculty He has been succeeded by Lieut Col Brian Blades, chief of the thoracic surgery section of Walter Reed General Hospital who is leaving the army Dr Blades graduated at Washington University School of Medicine, St Louis, in 1932 Dr White graduated at George Washington School of Medicine in 1898 and joined the faculty in 1901

**Diagnostic Clinic Planned**—Washington's first diagnostic clinic to be operated in conjunction with a hospital is planned as a part of the new George Washington University Hospital to be completed next year The proposed clinic, according to *Medical Annals,* will provide complete diagnostic services at reasonable cost to patients limited to the moderate income group, defined by Dr Walter A Bloedorn as $3,500 or less The clinic will be staffed by the faculty of the medical school in all the major departments of medicine and surgery It will accept only patients referred by the patient s private physician and will not give treatment. A standard fee will be charged for this service perhaps as low as $25 After diagnostic examination a complete report, accompanied if advisable by treatment recommendations, will be referred back to the patient s doctor

**Mental Hygiene Clinic for Adults**—The bureau of mental hygiene of the District Health Department opened a mental hygiene clinic for adults March 5 to give psychiatric examination and treatment to adult patients, other than alcoholic addicts who are unable to pay private physicians for such services Patients may apply directly to the bureau or they may be referred by any public or private agency In case of referral by a physician, the latter should submit a report on the physical examination and history After the first interview with the patient, the psychiatrist will decide whether or not he is suitable for treatment The psychiatrist will then notify the referring agency or physician of his opinion and his decision as to treatment Findings and diagnoses will be kept strictly confidential and will not be imparted to any one without the patient's consent The psychiatrist will give follow-up reports at reasonable intervals and notice about termination of treatment to the referring agency or physician Dr Leopold E Wexberg is director of the bureau of mental hygiene (THE JOURNAL, February 2, p 295)

## ILLINOIS

### Chicago

**Lecture Named for Dr Pusey**—Dr John H Stokes professor emeritus of dermatology and syphilology, University of Pennsylvania School of Medicine Philadelphia, and director Institute for the Study of Venereal Disease University of Pennsylvania, will deliver the first William Allen Pusey Memorial Lecture of the Institute of Medicine of Chicago at a meeting with the Chicago Society of Internal Medicine and the Chicago Dermatological Society, October 25, at the Palmer House His subject will be 'The Skin as a Field of Research" Dr Pusey, who once served as President of the American Medical Association, died Aug 29, 1940

## INDIANA

**Ray Smith Succeeds Thomas Hendricks**—Mr Ray E Smith, secretary of the Indianapolis Medical Society and part time assistant executive secretary of the Indiana State Medical Association, was on April 14 appointed executive secretary of the state medical association He succeeds Thomas A Hendricks, who had served as executive secretary for more than twenty one years and who resigned, effective May 1, to become full time secretary of the Council on Medical Service and Public Relations of the American Medical Association Mr Hendricks has been serving as part time secretary of the Council since March 1945 Mr Hendricks has sold his home in Indianapolis and is establishing permanent residence at Culver Dr Nesfen K Forster, Hammond, has been named associate editor of the *Journal of the Indiana State Medical Association* Mr Joseph E. Palmer Wabash has been named executive secretary of the Indianapolis Medical Society to succeed Mr Smith Mr Palmer has served on the staff of several Indiana newspapers and with the Chicago office of the Associated Press While in military service he served the European Theater of Operations in the field of public relations

## IOWA

## OKLAHOMA

**School Clinic for Spastics**—A permanent school clinic for spastics will be opened at Lincoln School Tulsa, next September under the auspices of the Oklahoma Crippled Children s Commission and with the endorsement of the Tulsa County Medical Society The proposed school is an outgrowth of certain investigations of the spastic situation in the Tulsa area carried on by the Tulsa council of social agencies and the city schools health department These two groups are co-sponsors with the Crippled Children s Commission. It is proposed to offer a program of normal education, physical training, physical therapy occupational rehabilitation or training and specialized medical supervision and treatment A trained physical therapist will be employed for the school and it is hoped to employ later an occupational therapist. The medical supervision of the clinic is to be under local Tulsa physicians who are interested in spastic problems, such physicians either to donate their service or to receive only a nominal fee.

## OREGON

**New Medical Administrator**—In March Dr Charles N Holman, medical director of hospitals and clinics at the University of Oregon Medical School Portland, was named to succeed the late Mr Ralph Couch as administrator of the University of Oregon hospitals and clinics Dr Holman graduated at the medical school in 1936 and has been associated with the Multnomah Hospital since 1940

**Clinical Studies Foundation Joins with Medical School.**—The research activities of the Clinical Studies Foundation are now a joint venture with the biochemistry department of the University of Oregon Medical School, Portland, according to a brochure recently made available The foundation was incorporated soon after the observation in 1937 by Dr John V Straumfjord, Astoria, of certain skin changes in patients who were taking a daily supplement of 100,000 units of vitamin A. The purpose of the corporation was to engage in "research work to ascertain the properties of vitamins and allied substances and their therapeutic value' and to raise funds for this work. A small laboratory was subsequently established. Since July 1945 the biochemical research has been under the direction of John T Van Bruggen, Ph.D, research associate department of biochemistry, University of Oregon Medical School Under the new joint arrangement the medical school agrees to extend the services of the staff of the department of biochemistry in joint administration and operation of a continuation of the study of the metabolism and function of vitamin A as well as into any other phase to which this study may lead. The work will be carried on in the Astoria Foundation laboratory, which is to be known as the Astoria Extension Research Laboratory Dr Straumfjord, president of the Clinical Studies Foundation, was given an appointment as research associate in the department of biochemistry at the medical school and director of the Astoria Extension Research Laboratory the appointment to terminate on severance of the association between the Astoria Laboratory and the department of biochemistry The foundation will make available supplies and equipment so long as the association shall continue, should it be discontinued these physical assets will revert to the Clinical Studies Foundation. The medical school will not assume any responsibility of raising funds for the project

## SOUTH CAROLINA

**Changes in Health Personnel**—Dr Clarence L Guyton, Columbia, who recently received his discharge from the Army Medical Corps, has resumed his position as director of the division of cancer control, South Carolina State Board of Public Health, and has been appointed director of the division of venereal disease control, effective February 1 Dr Joseph M Chisolm, Columbia who has been directing the venereal disease division during the war emergency on assignment from the U S Public Health Service, will continue as assistant director pending a new assignment from the U S Public Health Service——Dr Robert Wilson Ball, Columbia, has resigned as director of the division of maternal and child health of the state board of health to enter private practice in Columbia Dr Ball, who graduated at the Medical College of the State of South Carolina Charleston, in 1927, has been serving as director of the division of maternal and child health since 1936 He entered military service in 1941, returning to his position in November 1945

## TENNESSEE

**State Medical Election**—Dr Franklin B Bogart, Chattanooga, was named president elect of the Tennessee State Medical Association at its meeting in Knoxville, April 11, and Dr Charles M Hamilton, Nashville, was installed as president. Other officers include Drs. Lea Callaway, Marvville, Jesse P Baird Dyersburg, and William A Howard Cookeville, regional vice president. Dr William M Hardy, Nashville, was reelected secretary

## WASHINGTON

**Physician's "Past Record" Cause for Consideration**—On April 11 Presiding Superior Judge Matthew Hill deferred sentencing Dr Earle F Ristine, Seattle, to a term in prison for five years on condition that he pay a total fine of $7,000 according to the Seattle *Times* The physician was said to have pleaded guilty to two charges of abortion "Unlike most cases of this kind," Judge Hill said, 'there has been no death I think your past record entitles you to a deferment. However I'm going to make a condition you pay a fine of $3,500 on each count"

**Progress of New Medical School**—*Northwest Medicine* for April announces that four of the basic science departmental heads of the new University of Washington School of Medicine have been appointed. William F Windle, Ph D, professor of neurology Northwestern University Medical School Chicago, has been appointed professor of anatomy and executive officer of the department Richard A Groat, Ph.D., and Roland F Becker, Ph D, both of Northwestern, and William W Chambers, B.S Vanderbilt University School of Medicine, Nashville, Tenn., have also been named to the department of anatomy at Washington Dr Stuart W Lippincott, recently released from military service, Army Institute of Pathology, has been named professor of pathology and executive officer of the department. His appointment began on March 15, but he will remain at the Army Institute of Pathology for some months where he will select and supervise the preparation of pathologic, microscopic and projection slides for the department of pathology at the university Dr Robert F Pitts associate professor of physiology Cornell University Medical College, New York, has been appointed professor of physiology and executive officer of the department effective about July 1 and James M Dille, Ph.D formerly professor of pharmacology at the University of Washington School of Pharmacy and recently associate in physiology at the University of Illinois College of Medicine, has been named professor of pharmacology and executive officer of the department, effective about July 1 *Northwest Medicine* reported that the selection of clinical department heads and organization and development of clinical departments will be initiated as soon as the basic organization of the preclinic divisions has been satisfactorily completed. Preparatory to construction of a suitable building an architectural survey of a number of universities was made the results of which are now being considered to develop plans for the University of Washington schools of medicine and dentistry Dr Edward L. Turner is dean of the new medical school which was approved in the enactment of a bill calling for an appropriation of $450,000 to expand the premedical school and $3,750 000 to construct a medical school and hospital (THE JOURNAL, Feb 3, 1945 p 288, April 21, 1945, p 1067, Oct. 13, 1945, p 524)

## WISCONSIN

**Dinner to Dr Carey**—Dr Eben J Carey was guest of honor at a dinner May 1 given in recognition of his completion of twenty-five years service to Marquette University School of Medicine Milwaukee Dr Carey who graduated at the University of Chicago School of Medicine in 1925, joined the university as professor and director of the department of anatomy becoming dean in 1933

**One Hundred Years of Medicine**—A centennial hall of health, April 27-May 3, marked the 100th anniversary of the founding of the Medical Society of Milwaukee County and the city of Milwaukee (THE JOURNAL, April 20, p 1183) The program was officially opened the first night by John L Bohn, mayor of the city Speakers in the week's program included

Dr Edward R Krumbiegel Milwaukee One Hundred Years of Progress of Medicine in Milwaukee
Dr Morris Fishbein Chicago, Health of the Nation
Dr Walter C Alvarez Rochester Minn How Women Make Themselves Ill
Dr W W Bauer Chicago There are No Problem Children
Dr Harry M Hedge, Chicago Care of the Skin and Cosmetics.
Dr David Slight Chicago Health and the Emotions
Dr Edward A Piszczek Chicago Infantile Paralysis
Dr Josiah J Moore Chicago moderator

Local societies cooperated in sponsoring lectures, and various exhibits and demonstrations were included Marquette University School of Medicine Milwaukee supplied 110 guides in rotation during the seven days the exhibit was open, and school children were taken on scheduled two hour tours

## GENERAL

**Maternal Welfare Committee Moves**—On April 15 the American Committee on Maternal Welfare, Inc moved to a new office at 24 West Ohio Street Chicago 10 All correspondence concerning the affairs of the committee, the American Congress on Obstetrics and Gynecology *the Mother* or the National Federation of Obstetric-Gynecologic Societies should be sent to this new street address and postal zone

**Cerebral Palsy Division Created**—The National Society for Crippled Children and Adults Inc will create a special cerebral palsy division to carry out its national program to assist persons afflicted with this condition. A director will be appointed for the division which will project a six point plan aimed to insure the cerebral palsy health and medical care social welfare and security recreational educational and employment opportunities as well as foster and extend research in the care and prevention of the disease The National Society for Crippled Children and Adults will establish a special fund to extend the program for the training of personnel and research

**New Members of Academy of Sciences**—Included among twenty nine leaders in American science who were elected to membership in the National Academy of Sciences recently are

Dr Paul Roberts Cannon professor of pathology University of Chicago School of Medicine
Karl Paul Link Ph D professor of biochemistry University of Wisconsin Medical School Madison
Dr Robert F Loeb Lambert professor of medicine Columbia University College of Physicians and Surgeons New York
Dr Esmond Ray Long professor of pathology University of Pennsylvania School of Medicine, Philadelphia, director of laboratories Henry Phipps Institute
Stanley Smith Stevens Ph D associate professor of physiology Harvard University

**Grants to Aid Survey of Child Health**—The American Academy of Pediatrics on May 13 announced the following grants totaling $237,500 which have been either received or pledged on a two year basis to support its study of child health services

National Foundation for Infantile Paralysis $116 000
Field Foundation $10 000
American Academy of Pediatrics $18 000
New England Pediatric Society $500
Mead Johnson and Company $28 000
M and R. Dietetic Laboratories $20 000
Carnation Company $20 000
Pet Milk Company $20 000
Lederle Laboratories $5 000

Dr John P Hubbard instructor of pediatrics (on leave) Harvard Medical School Boston, is the executive director of the study under the auspices of a specially appointed committee (THE JOURNAL, February 2 p 298)

**William White Resigns as Tuberculosis Chairman**—Dr William C White Washington, D C. chairman of the committee on medical research National Tuberculosis Association since 1921 resigned, effective March 1 ending more than twenty-five years service to the organization Dr White has been succeeded by Dr Henry S K. Willis, superintendent and medical director of the William H. Maybury Sanatorium at Northville Mich who will act as interim director pending the selection of a permanent director The association's first committee on research was formed prior to 1916 with Dr Edward R Baldwin, Saranac Lake N Y, as chairman, but, partly owing to America's entry into the first world war, did not function In 1921 Dr Gerald B Webb Colorado Springs, Colo, at that time National Tuberculosis Association president, appointed a new committee headed by Dr White, which was given the responsibility of developing research in the tuberculosis field Under Dr White's leadership the committee made its first grant of $500 the same year to William Snow Miller for a study of the anatomy of the lungs and has granted more than $600 000 since that time for the carrying on of approximately fifty studies

**Meeting on Research in Ophthalmology**—The fifteenth scientific meeting of the Association for Research in Ophthalmology will be held at the Mark Hopkins Hotel, San Francisco, July 2 Included among the speakers will be

Dr Phillips Thygeson Menlo Park Calif, The Cytology of Conjunctival Exudates
Dr Arthur J Bedell Albany N Y Macular Edema.
Dr Jerome W Bettman San Francisco Experimental Dinitrophenol Cataract Effects of Obesity Age and Environmental Temperature
Dr Austin I Fink Brooklyn Changes in the Angioscotomas Associated with the Oral Administration of Evipal
V Everett Kinsey Ph D Blanche Jackson Ph D, and Dr Theodore L Terry Boston Relation Between Maternal Vitamin A Blood Level and Ocular Abnormalities in the Offspring
Dr Maurice J Drell Marjorie Bohnhoff B S and Dr Charles P Miller all of Chicago Experimental Gonorrheal Iritis The Role of the Lens in Growth of the Gonococcus
Drs Alston Callahan and Frederick C Redlich Birmingham Electroencephalography and Ophthalmology
Dr Charles W Ascher Cincinnati Further Observations on Aqueous Veins

**New Research Institute**—Formation of the Sterling-Winthrop Research Institute as a new division of Sterling Drug, Inc. to expand its research and coordinate that of its divisions and subsidiaries was announced May 6 The institute will be housed in new research laboratories to be erected at Rensselaer N Y, when building materials are available Dr Maurice L Tainter Rensselaer N Y, at present research director of Winthrop Chemical Company, Inc., a subsidiary, has been named director of the Sterling-Winthrop Research Institute Its administrative board consists of Edward S Rogers, chairman of the board of Sterling Mr Hill, Dr Theodore G Klumpp, New York Winthrop president Dr John M Hiebert, Sterling vice president and general manager of the Frederick Stearns and Company division Detroit and Dr Tainter Situated on a 70 acre site near the Winthrop plant and laboratories the institute will employ 350 scientists and assistants The structure will consist of three wings built in the general form of the letter U In addition to offices the administrative wing of the new structure will have lecture rooms and space for a complete technical library The east wing will contain, in addition to biologic laboratory units rooms for photography X-ray and extreme temperature testing The west wing will house pharmaceutical and chemical research laboratory units, together with special chemical development facilities and a pilot plant

**Mental Health Foundation**—Formation of the National Mental Health Foundation is announced Headquarters are at 3500 Lancaster Avenue Philadelphia, and officers include Leonard Edelstein, executive secretary Harold Barton education director and Alex Sareyan, public relations manager The foundation is a nonprofit corporation which according to its charter has been developed to help interpret to the public the nature of mental illness and mental deficiency to cooperate with others in the promotion of mental health and to seek higher standards of care and treatment in mental hospitals In a statement to the press it was stated that instead of censuring those who strive to succeed in spite of their limitations the National Mental Health Foundation will endeavor to enlighten and aid rather than to censure and condemn." Thus far the foundation has procured descriptions of conditions in approximately one fifth of all state mental hospitals from more than 1 400 reports from institutional employees Training material for hospital personnel is being prepared and distributed Several series of leaflets and pamphlets interpreting mental illness in simple graphic style are in preparation The first draft of a model mental health law based on a survey of laws pertaining to mental illness in more than thirty states is being prepared and is to be made available to legislators and health administrators when completed The program is under the advisory guidance of prominent psychiatrists hospital administrators and lawyers Among those who have served or are serving in this capacity are Dr Earl D Bond Philadelphia director of Research Institute of Pennsylvania Hospital Dr Robert H Felix Baltimore, general chief mental hygiene division, U S Public Health Service Dr Samuel W Hamilton, Washington D C. president-elect of the American Psychiatric Association,

Dr James Lewald superintendent of the District Training School, Laurel, Md., Dr George S Stevenson New York, medical director of the National Committee for Mental Hygiene, Dr Edward A Strecker, professor of psychiatry, University of Pennsylvania School of Medicine Philadelphia, Dr Charles A Zeller, director of the department of mental health of the state of Michigan and William D Lewis, director of the American Law Institute

**Social Welfare Assembly**—Mr Charles P Taft, Cincinnati lawyer and son of former President William Howard Taft has been nominated for the presidency of the newly formed National Social Welfare Assembly, which was officially launched at a luncheon April 29 at the Hotel Commodore, New York The National Social Welfare Assembly marks the joining of forces on the part of thirty five leading national organizations including the American Red Cross Y M C A National Tuberculosis Association, Boy Scouts Salvation Army Family Welfare Association of America Child Welfare League the Federal Housing Agency and other large nationwide services, including health, social welfare labor and government agencies The purpose of the assembly is said 'to fill the long felt need for more coordinated and effective national planning to meet the urgent social and health problems of the country" Under the new organization each of the affiliate organizations will nominate members to the assembly but will retain its own autonomy, with members serving as individuals Robert E Bondy, formerly administrator of services to the armed forces and veterans' affairs of the American Red Cross has been engaged as executive director Headquarters of the new assembly will be located at 1790 Broadway New York The assembly is an outgrowth of the National Social Work Council twenty-five year old forum group of organization workers whose members, "recognizing the need for a more aggressive and centralized attack on the health and welfare problems of the country,' have created the new agency

**Orthopedic Meeting**—The 1946 session of the American Orthopaedic Association will be held at the Homestead Hotel Hot Springs Va June 27 29, under the presidency of Dr James A Key Cardston Alta Among the speakers will be

Dr James E. M Thomson Lincoln Neb The Calcaneovalgus Foot of Infancy
Dr Russell P Schwartz Rochester N Y The Definition of Human Locomotion on the Basis of Measurement with Description of Oscillographic Method
Dr Robert I Harris Toronto Ontario Canada Hypermobile Flat Foot with Short Tendo Achillis From Observations in the Canadian Army
Dr Steele F Stewart Honolulu Hawaii Preemployment Back Examinations and Their Significance
Dr Sterling Bunnell San Francisco A System for Splinting Hands for Radial Ulnar and Median Paralyses
Dr Ralph K Ghormley Rochester Minn Postgraduate Teaching in Orthopedic Surgery
Dr Arthur Steindler Iowa City Newer Observations on the Experimental Contributions in Infantile Paralysis and Their Correlation to Pathologic Facts The Rationalization of Treatment of Infantile Paralysis on These Grounds
Dr Donald A G Murray Toronto Ont Canada End Results of Bone Grafting for Nonunion of the Carpal Navicular Based on the Study of 100 Cases
Dr LeRoy C Abbott San Francisco The Evaluation of Cortical and Cancellous Bone as a Grafting Material A Clinical and Experimental Study
Mr Harry Platt, Manchester England subject not announced
Drs Allen E Voshell Charles J Basile William I Waldrop and Moses Gellman all of Baltimore Subtalar Arthrodesis for Certain Types of Flat Feet
Dr David M Bosworth New York Fracture Dislocation of the Ankle with Fixed Displacement of the Fibula Behind the Tibia
Dr Nicholas S Ransohoff New York Medical Electronics Electromyographic Studies of Muscle Action Currents

**Atlas of Disease**—The American Geographical Society is considering the publication of an Atlas of Disease to be compiled by cooperating medical scientists and geographers As a preliminary step in the project the *Geographical Review* will publish from time to time results of certain surveys, the first of which appeared recently on the fluorine conditions in United States water supplies According to the New York *Times* through the pilot project the geographers hope to demonstrate how modern geographic technics can contribute toward understanding and control of some diseases and discover the lines along which more elaborate studies can be made of more difficult relationships between environment and public health At a meeting March 20 Roland L Redmond, president of the society said 'We want the atlas to be a pathfinder an instrument that will develop the technics and allow other people to go forward in their particular field" It was brought out that there are three broad divisions of medical geography the distribution of diseases over the earth the influence of environment on disease and the influence of disease on human geography, for example, settlement patterns and exploration The conference agreed that the atlas should deal primarily with the second of the divisions, the correlation of disease with the natural and social environment The conference, after considerable discussion, selected ten diseases for study and representation on the Atlas of Diseases The order of preference was cholera the typhus group malaria, yellow fever, goiter, plague, beriberi and pellagra, filariasis (parasitic worm infestation), encephalitis and schistosomiasis One of the conclusions reached at the discussion was that, as to the general purpose the atlas was to be designed primarily as a tool of research rather than as a textbook It was decided that certain parts, however, might well be adapted to the practical needs of individuals and institutions coping with the control of diseases under special conditions, for example those of air transport. The mode of publication will preferably be loose leaf or in parts If medical data on any particular disease cannot be assembled for a considerable time, certain basic geographic maps may be issued first. As significant new data become available, certain parts are to be revised concurrently with the publication of other parts, possibly with advance publication through medical or geographic journals

# Government Services

## New Appointment for Dr Axelrod

Dr Solomon J Axelrod surgeon (R), U S Public Health Service, has been appointed chief, health services division labor branch, United States Department of Agriculture Dr Axelrod, who has been on detail to the department of agriculture since December 1943, was formerly with the Chattanooga-Hamilton County (Tenn) Health Department and graduated at Jefferson Medical College Philadelphia in 1938

# Deaths

**Jacob Sergi Kasanin** ⊕ San Francisco, University of Michigan Department of Medicine and Surgery Ann Arbor, 1921, born in Novgorod, Russia May 11 1897, since 1940 assistant clinical professor of psychiatry at the University of California Medical School specialist certified by the American Board of Psychiatry and Neurology, Inc member of the American Psychoanalytic Association American Psychiatric Association, Central Neuropsychiatric Association New England Society of Neurology and Psychiatry, Chicago Psychoanalytic Society, Chicago Neurological Society, Northern California Society of Neurology and Psychiatry and the California Academy of Medicine past president of the American Orthopsychiatric Association in 1927 placed in charge of a new department of mental hygiene of the Federated Jewish Charities of Boston senior research associate of the Rockefeller Foundation at the Boston Psychopathic Hospital from 1927 to 1931 member of the staff of the Evans Memorial and Beth Israel hospitals and Boston Dispensary from 1929 to 1931 formerly lecturer in social psychiatry at Brown University and the Smith College School of Social Work clinical director of the Rhode Island State Hospital for Mental Disease, Howard from 1932 to 1936 when he became director of the psychiatric department at the Michael Reese Hospital in Chicago where he had been assistant clinical professor in psychiatry at Rush Medical College psychiatric consultant to the Army's Ninth Service Command during World War II active in setting up a rehabilitation clinic for veterans associate editor of Diseases of the Nervous System author of Language and Thought in Schizophrenia', chief of the neurologic and psychiatric service at the Mount Zion Hospital, where he established a child guidance clinic and where he died May 4, aged 48 of cerebral hemorrhage.

**Arthur Duke Ferguson,** Benton Mo, Barnes Medical College, St Louis 1906, born in Osage County, Mo June 12 1874, member of the American Medical Association past president of the Shelby County Medical Society, past president and secretary of the Callaway County Medical Society, served during World War I, at one time practiced in Hunnewell, where he was mayor and president of the board of education formerly on the staff of the State Hospital in Fulton, recently received a citation from the government for his four years of service as medical examiner for the Scott County draft board died in the Southeast Missouri Hospital, Cape Girardeau January 14, aged 71, of carcinoma.

**William Byron Agan** ⊕ Brooklyn Columbia University College of Physicians and Surgeons, New York, 1912, specialist certified by the American Board of Ophthalmology member of the American Academy of Ophthalmology and Otolaryngology fellow of the American College of Surgeons, past president of the Brooklyn Ophthalmological Society, member of the staffs of the Brooklyn Eye and Ear Hospital, St. John's Hospital and the House of St. Giles the Cripple died in the Methodist Hospital February 5 aged 58, of myocardial infarction

**Charles Crawford Allen** ⊕ Austin Minn. University of Minnesota College of Medicine and Surgery Minneapolis 1910, president of the Mower County Public Health Association past president of the Southern Medical Association and the Mower County Medical Society formerly city health officer, county physician and chief of staff of the St. Olaf Hospital served during World War I trustee of the Carleton College died February 20 aged 60, of coronary thrombosis

**Charles Howard Aufhammer,** Coatesville Pa University of Pennsylvania Department of Medicine Philadelphia, 1906, fellow of the American College of Surgeons for many years on the staff of the Allegheny General Hospital, Pittsburgh, died in Thorndale February 14 aged 65

**John H Beavers,** Wesson Miss Medical Department of Tulane University of Louisiana, New Orleans 1895 member of the American Medical Association died January 1, aged 74

**Wesley Jackson Breeding,** Lakeland Fla. University of Tennessee Medical Department Nashville, 1893, member of the American Medical Association honorary member of the Tennessee State Medical Association formerly member of the state board of health of Tennessee died February 19 aged 76 of coronary thrombosis and generalized arteriosclerosis

**Harvey Elmer Corl,** Middlebranch Ohio Jefferson Medical College of Philadelphia 1893, past president of the Stark County Medical Society, died January 3 aged 77 of heart disease

**Albert Schuyler Fountain** ⊕ Colorado Springs, Colo, Keokuk (Iowa) Medical College, College of Physicians and Surgeons, 1906, died in St Francis Hospital February 4, aged 76, of coronary thrombosis

**John Christian Germann,** Valhalla, N Y, University of the City of New York Medical Department, New York, 1893, member of the American Medical Association, formerly president of the North Brooklyn Medical Society, died February 6, aged 74, of carcinoma of the esophagus

**Carl Victor Green Jr,** Los Angeles, University of Southern California School of Medicine, Los Angeles, 1933, member of the American Medical Association, served as a medical officer in the regular U S Navy, died December 18, aged 45

**David Milton Greene,** Detroit, University of Michigan Department of Medicine and Surgery, Ann Arbor, 1881 one of the founders of the Highland Park (Mich) General Hospital where he was a member of the board of managers, chief of the surgical staff and chairman of the executive committee, died December 30, aged 92.

**Stephen Greenfield** ⊕ Akron Ohio, University and Bellevue Hospital Medical College, New York, 1909, head of the medical examining committee of Selective Service Board number 5 during World War II, died in the City Hospital February 19, aged 58, of coronary thrombosis

**Hunter Lee Gregory** ⊕ Stockton, Calif, Medical College of Virginia, Richmond, 1915, fellow of the American College of Surgeons, on the staff of the San Joaquin General Hospital, French Camp St Joseph's Home and Hospital and the Dameron Hospital, died recently, aged 56

**Robert Lawson Hargrave,** Wichita Falls, Texas, Medical Department of Tulane University of Louisiana, New Orleans 1906, specialist certified by the American Board of Surgery, fellow of the American College of Surgeons attending surgeon Bethania and Wichita General hospitals, died January 29, of angina pectoris and cirrhosis of the liver

**August Frederick Henke** ⊕ St. Louis Missouri Medical College, St Louis, 1896 at one time assistant in internal medicine at his alma mater and instructor in medicine at the Washington University School of Medicine, member of the staffs of the De Paul and Deaconess hospitals member of the William Beaumont Memorial Committee of the St. Louis Medical Society, died December 19 aged 72, of carcinoma

**Charles Bernard Herman** ⊕ Statesville, N C, Jefferson Medical College of Philadelphia 1923, died January 18 apparently of heart disease after he had reached shore following the capsizing of his boat, aged 46

**George E Holtzapple** ⊕ York, Pa Bellevue Hospital Medical College, New York, 1884 specialist certified by the American Board of Internal Medicine fellow of the American College of Physicians for many years on the staff of the York Hospital, early in his career prominently identified for his successful use of oxygen in the treatment of pneumonia died February 22, aged 83 of chronic myocarditis

**Fred Henry Howard,** Strawberry Point Iowa the Hahnemann Medical College and Hospital, Chicago 1885 member of the American Medical Association, died February 4 aged 86, of carcinoma

**Charles Oliver Johnston,** Claysburg, Pa., Medico-Chirurgical College of Philadelphia 1897, member of the American Medical Association on the staff of the Nason Hospital Roaring Spring since 1912 president of the First National Bank, died January 21, aged 73, following an operation for mesenteric cyst

**Hiram Truman Jones** ⊕ Lawrence Kan, University Medical College of Kansas City Mo, 1899 member of the Radiological Society of North America Inc. past president of the Douglas County Medical Society, for many years county coroner team physician for the university athletic department from 1905 to 1919 captain in the medical corps of the state National Guard on the staff of the Lawrence Memorial Hospital where he died February 6 aged 72 of arteriosclerotic heart disease

**Norwin Lester Kerr** ⊕ Scottdale, Pa., College of Physicians and Surgeons Baltimore 1913, served during World War I on the staff of the Connellsville (Pa.) State Hospital, died January 22, aged 62 of angina pectoris

**Cora Irene Kipp,** Bareilly United Provinces India College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1909 for many years a medical missionary in India died February 20 aged 65 of heart disease, aboard ship en route to her home in this country

**Emil Koffler** ⊕ New York Universitatea din Bucuresti Facultatea de Medicina Rumania 1905 specialist certified by the American Board of Internal Medicine past president of the Bronx County Medical Association, fellow of the New York Academy of Medicine, at various times on the staffs of the Beth Israel and Montefiore hospitals for many years on the staff of the Bronx Hospital where he died February 14 aged 65, of meningitis

**Claude Clay Leaverton,** Tacoma, Wash University of Texas *School of Medicine, Galveston 1917, member of the* American Medical Association fellow of the American College of Surgeons on the staffs of the Tacoma General and St. *Joseph's hospitals, died recently, aged 57*

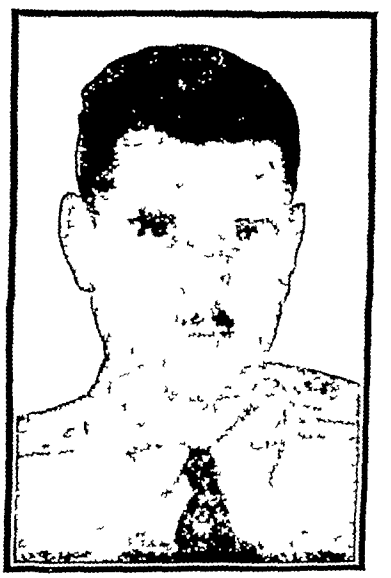
**Emily Lewi** ⊕ New York, Woman's Medical College of the New York Infirmary for Women and Children New York, 1891 affiliated with the New York Infirmary for Women and Children where she died February 28, aged 79, of atypical virus pneumonia

**John James McNamara** ⊕ Brockton Mass Tufts College Medical School Boston 1900 past president of the Plymouth District Medical Society, served during World War I on the staff of the Brockton Hospital, died in the Palmer Memorial Hospital, Boston, January 3, aged 73 of coronary thrombosis and lymphatic leukemia

**Alvah Londus Parsons,** Putney W Va, University of Louisville Medical Department 1909, served in the medical corps of the U S Army overseas for eighteen months during World War I, died May 8, aged 63, of heart disease

**Robert Quincy Patterson** ⊕ Little Rock Ark, Vanderbilt University School of Medicine, Nashville, Tenn, 1900, professor of dermatology and syphilology at the University of Arkansas School of Medicine, specialist certified by the American Board of Dermatology and Syphilology on the staffs of the Arkansas Children's Home and Hospital Baptist State Hospital St. Vincent's Infirmary, University Hospital and the Veterans Administration Facility, died January 23, aged 75, of hypertensive heart disease

**John Francis Russell,** New York, Columbian University Medical Department, Washington, D C, 1879, College of Physicians and Surgeons, medical department of Columbia College, New York, 1880, died in the New York Hospital January 8, aged 90



**Melchior Francis R. Savarese,** Orange, Conn., Long Island College Hospital, Brooklyn, 1911, member of the American Medical Association, on the staff of the New Haven Hospital, died in the Hospital of St Raphael, New Haven January 10, aged 64 of heart disease.

CAPT HARRY S HICKMAN
M C, A U S 1914-1944

LIEUT GORDON K. LAMBERT
(MC), U S N, 1909-1944

COL. ARMIN WALTER LEUSCHNER
M C, U S Army, 1905-1944

**Rufus Ingalls Newell,** Oakland Calif, College of Physicians and Surgeons Baltimore 1902 served during World War I formerly city physician and member of the Alameda County Charities Commission died in the Providence Hospital January 26 aged 65, of abdominal cancer and arteriosclerosis

**Herman H Schultz** ⊕ Ingleside, Neb Cotner University Medical Department Lincoln, 1893, *member of the Colorado* State Medical Society and the American Trudeau Society, served on the staff of the Modern Woodmen of America Hospital, Woodmen, Colo, assistant superintendent in charge

## KILLED IN ACTION

**Harry Samuel Hickman,** Grants Pass, Ore College of Medical Evangelists Los Angeles, 1940, interned at the Sacred Heart Hospital in Spokane, Wash diplomate of the National Board of Medical Examiners, began active duty in the medical reserve corps of the U S Army on Oct 14 1940 promoted to captain in the medical corps, Army of the United States on March 11 1942, died in the South China Sea Oct. 24 1944 aged 30, when the ship on which he was being transported to Japan was sunk by submarine action

**Gordon Kenneth Lambert** ⊕ Passed Assistant Surgeon Lieutenant, U S Navy Rochester, N Y, University of Rochester *School of Medicine and Dentistry* 1935 interned at the Highland Hospital in Rochester and the U S Naval Hospital in Washington D C, entered the U S Navy as an assistant surgeon lieutenant (jg) in August 1936 later promoted to lieutenant served as ship's doctor on the battleship *Arkansas* for three years sent overseas in September 1941 first stationed at Cavite and later transferred to Manila, where he was captured in January 1942, posthumously awarded the Bronze Star Medal for heroism during a Jap bombing attack, died in Bilibid Prison in the Philippines, Dec. 15, 1944 aged 35

**Armin Walter Leuschner** ⊕ Colonel M C U S Army Belleville, Ill Washington University School of Medicine, St Louis 1929 U S Army Medical School in 1932 interned at the Research Hospital in Kansas City, Mo entered the medical corps of the U S Army as a first lieutenant on Sept. 1, 1930 later promoted to captain major, lieutenant colonel and colonel died in Leyte, P I., Oct. 26 1944 aged 39, of battle wounds

of tuberculosis work at the Hastings State Hospital, died in the Mary Lanning Hospital, Hastings, January 10, aged 77, of embolism following an appendectomy and cholecystotomy

**Nathaniel Harvey Scott,** Wolfeboro, N H , Medical School of Maine, Portland, 1874, member of the American Medical Association, formerly member of the state legislature, died January 25, aged 94, of arteriosclerosis

**Charles A Shirey,** Manor, Pa University of Pennsylvania Department of Medicine, Philadelphia, 1893, member of the American Medical Association, served as bank director, died January 1, aged 83, of senility

**Charles Edward Smith,** Oklahoma City, Dallas Medical College, 1903, died January 21, aged 72, of influenza and pneumonia

**Charles G Smith,** Red Bud, Ill Marion-Sims College of Medicine, St Louis, 1892, Hospital College of Medicine, Louisville, 1892, also a pharmacist, served as a member of the school board and health officer, died in Kensington Md., April 19 aged 77, of coronary thrombosis

**Robert Leslie Spencer,** Dayton Pa., Medical Department of the Western University of Pennsylvania Pittsburgh, 1892, also a dentist died in Franklin December 16 aged 74 of cerebral hemorrhage

**Louis George Stuhler,** Rochester, Minn , State University of Iowa College of Medicine, Iowa City 1906 member of the American Medical Association, assistant professor of urology at the University of Minnesota Graduate School, served as a medical officer during World War I, died January 9, aged 62, of heart disease

**Percy Lee Templeton,** Montpelier, Vt , United States Medical College New York, 1882 past president of the state board of medical registration, honorary member of the Vermont State Medical Society member of the American Medical Association died January 1, aged 87, of senility

**William Anthony Terheyden** ⊕ Pittsburgh, Western Pennsylvania Medical College Pittsburgh 1901 served as a member of the visiting staff of St. Francis Hospital and physician to the Little Sisters of the Poor Home for the Aged, died January 6, aged 77, of rheumatic heart disease

**Curtis Wade Welch,** Santa Barbara, Calif , University of Southern California College of Medicine, Los Angeles, 1898, died recently, aged 70, of cerebral hemorrhage

**Henry C Werner,** Meta, Mo Missouri Medical College, St Louis, 1894, died January 14

**Frank A Winship,** Eagle Mills N Y , Albany Medical College 1888, member of the American Medical Association

CAPT LEONARD JOSEPH MCGEE
M C, A U S, 1917-1945

LIEUT ALBERT JOHN PORPORATO
(MC), U S N R., 1906-1945

LIEUT PAUL GERHARDT SCHROEDER
(MC) U S Navy, 1914-1945

**Walter Sherman Stuckey,** Wapakoneta Ohio Fort Wayne College of Medicine, 1892 past president of the Auglaize County Medical Society formerly the coroner of Auglaize County and president of the city council died January 21 aged 79, of carcinoma

honorary member of the Samaritan and Leonard hospitals in Troy recently awarded a medal by the Alumni Association of the Albany Medical College for "fifty years meritorious service to humanity" died December 3, aged 82, of bronchopneumonia and arteriosclerosis

## KILLED IN ACTION

**Leonard Joseph McGee,** Bristol Pa Jefferson Medical College of Philadelphia 1943 interned at the Nazareth Hospital in Philadelphia which dedicated its newly formed blood bank in his memory began active duty as a first lieutenant in the medical corps Army of the United States in December 1943 promoted to captain battalion surgeon of the 194th Glider Infantry 17th Airborne Division killed in action in Germany March 24, 1945 aged 27

**Albert John Porporato,** San Francisco, Creighton University School of Medicine Omaha 1932 member of the American Medical Association interned at the Southern Pacific General Hospital began active duty as a lieutenant in the medical corps U S Naval Reserve, on Sept 15 1942 assigned as naval officer on the procurement board in Seattle in February 1944 assigned to overseas duty actively participated in the invasion of Saipan, Leyte, Luzon Palau Tarawa Iwo Jima and Okinawa killed in action in the Asiatic area on the U S S *Pinckney* April 28, 1945 aged 38

**Paul Gerhardt Schroeder** ⊕ Passed Assistant Surgeon Lieutenant, U S Navy, Reading, Pa Syracuse University College of Medicine 1940, served an internship at the Reading (Pa ) Hospital and a residency at the Wernersville (Pa ) State Hospital, entered the medical corps of the U S Navy as a lieutenant (jg) in September 1942 a flight surgeon sent to the Pacific in 1944, while stationed at Glenview, Ill was cited by the Secretary of the Navy and awarded the Commendation ribbon following his saving the life of a flier whom he pulled out of a burning plane after a crash died in the Asiatic area May 11, 1945, aged 30

### Test Home for the War Paraplegic

During the war much progress was made in the treatment of paraplegia It is estimated that there are now 500 and that 40 per cent are young married men of an average age of 26 years The problem of their future has engaged the attention of the British Legion Much thought has been given to their rehabilitation, so that they will be kept fit and the feeling of uselessness removed, and that they can live as normally as possible with their families and be provided with a type of work in which they can interest themselves Much excellent work has been done at the Ministry of Pensions Paraplegic Hospital at Stoke Mandeville A new step is the taking over of Walton House by the British Legion as a test home for giving the paraplegic and their families an opportunity to rebuild family life. Wives are given instructions on how to treat husbands and during the month's stay will have the experience of looking after them If at the end of the time the wives find that they cannot undertake the responsibility, the British Legion will consider how further help can be given

At the ceremony of opening the House Major Gen H H Blake, superintendent of the Paraplegic Hospital and Dr Prideaux of the Ministry of Pensions expressed confidence in the plan Sir Brunel Cohen, treasurer of the British Legion, spoke of the difficult part that has to be played in this form of rehabilitation by the wives

### British Medical Journal to Reestablish Abstract Service

For many years the *British Medical Journal* published an epitome of current medical literature and then abandoned it as not sufficiently useful to its readers The *Journal* now proposes to reestablish the epitome, suitably modified The aim will be to supply abstracts through three different channels by publication of two monthly abstracting journals, one for medicine and the other for surgery, gynecology and obstetrics, by publication in each of the association's quarterly journals of abstract sections in the services covered by them, and by the reestablishment of the epitome mentioned. It will be necessary to cover about twelve hundred journals for a comprehensive abstract service. The proposed date of starting publication is January 1947, which means that the abstracting staff, including a medically qualified editor and assistant editor, lay subeditor, medical librarian, linguist and clinical assistants will have to begin work next July

At the meeting of the council of the association, which approved the plan unanimously, it was argued that nothing could be more inspiring than an English abstracting service for world medicine. It was also a good business proposition and even if it entailed a loss of $4,000 a year it should be undertaken It was also agreed that the association should undertake the publication of another special journal—a quarterly journal of clinical pathology

### Appendicitis in the Newborn

At the Royal Society of Medicine Mr W Etherington-Wilson reported a rare case of appendicitis in a newborn infant. A premature boy weighing 3½ pounds (1,588 Gm ) at birth did well until the fourteenth day, when he ceased feeding, vomited and appeared to be in pain, with a rise of temperature. The condition progressed until the sixteenth day, when the author was consulted The condition of the infant was grave, with pinched facies and signs of dehydration. Vomiting of small amounts of clear fluid continued, and there was constipation The abdomen was distended, tympanitic and tender all over The temperature was not elevated and the pulse was difficult to count. Much weight had been lost An exact diagnosis was not made, although peritonitis was suspected. Preoperative infusions were given with considerable improvement Operation was performed under spinal analgesia A right paramedial incision was made. A retrocecal appendix, an immobile cecum and diffuse peritonitis were found. The incision had been placed too high for a difficult appendectomy, and it was considered unjustifiable to enlarge it. The pelvis was drained and the incision sutured For twelve hours the child improved, probably because of the compensated dehydration, but death occurred forty eight hours later Necropsy showed the distal half of the appendix to be gangrenous, with adherent and enlarged lymph nodes visible The specimen was presented to the Museum of the Royal College of Surgeons

### Chronaximetric Test of Pregnancy

Paul Chauchard has investigated the chronaxia of muscles in the Neurophysiology Laboratory of the Sorbonne He has found that the chronaxia of the uterine muscle varies a great deal under the influence of endocrine action A diminution of chronaxia time is caused by estrogens and an increase by progesterone or gonadotropic substance. He has measured by the chronaximetric method the inhibitory action of the urine of pregnant women on uterine contractility and has established a new test of pregnancy The technic is as follows Two electrodes are applied to the uterus, exposed by laparotomy, of a nonpregnant guinea pig, a vaginal silver torsade being used as anode and a fine silver plated needle as cathode, which is fixed in the cornu uteri The normal chronaxia of non-pregnant uterine muscle is measured by known processes A drop of the urine or serum to be examined is then applied to the cornu at the level of the cathode, and after one or two minutes the chronaxia is measured again If the woman is pregnant, the chronaxia increases, the diagnosis is established within fifteen minutes After the cornu uteri has been washed with isotonic solution of three chlorides the chronaxia becomes normal again It is therefore possible to do repeated examinations The animal can be used again if the operation has been aseptically conducted Chauchard has found that only the urine of a subject under glandular treatment will give this result The biologic test of pregnancy can be obtained early In a three weeks pregnancy there is two and one half times the normal chronaxia, from two to seven months it is ten to twenty times greater, it then diminishes until two or three days before delivery when it becomes almost normal Therefore, by this method, it is possible to foretell delivery forty-eight hours in advance. The author has never had a misleading result. Correct reading of the chronaximeter is absolutely necessary A portable chronaximeter has been built

### Health of Former Prisoners of War and Deported

At a recent meeting of the Medical Society of the Paris Hospitals, Pierre Bourgeois former chief of the Sanitary Service of the Ministry for Prisoners and Deported made a report on the results of x-ray studies for tuberculosis performed during repatriation Of 833,410 roentgenograms 2 per cent of suspected active tuberculosis and 1 per cent of nonevolutive pulmonary sequelae were found The highest rate of tuberculosis was found in the political deported, 10 per cent, in deported workmen, 2 to 3 per cent, in prisoners of war, 1 5 per cent At a recent meeting of the Society for Scientific Studies on Tuberculosis, Tourestier pointed out that 0 64 per cent was the rate of detected tuberculosis in the whole civil population of Montreuil (32,823 persons) in May 1945 At a meeting of the Medical Society of the Paris Hospitals Etienne Bernard empha-

sized that the morbidity in prisoners of war was much larger than that shown during repatriation A large number of the tuberculous, especially those seriously affected, were sent back by the Germans during the years previous to the liberation since they were unfit for work On the other hand, as pointed out by Professor Richet at the same meeting, most of the tuberculous deported died in the camps, 100 necropsies at Buchenwald showed that 40 per cent of the deaths were due to tuberculosis

### Metrazol in Dermatology

J Charpy and A Grapin report in the *Lyon Médical* the results they have obtained with metrazol in 200 dermatologic cases The authors found that there was no danger of shock if metrazol was given by mouth or intramuscularly Two types of treatment were employed 1 Short intensive therapy was employed in cases of localized pruritus, such as anoscrotal pruritus, anovulvar pruritus, neurodermatitis and lichen For three to five days one injection of 100 to 200 mg of metrazol is given intramuscularly with 100 to 300 mg every two to three hours orally—a total of 700 mg to 2 Gm daily Nurslings over 6 months, who tolerate metrazol better than adults, are given 100 to 200 mg every two to three hours There was immediate relief of pruritus or rapid sedation within twenty-four to forty-eight hours Pains due to zona and herpes were also relieved Improvement occurred in 10 cases of chronic urticaria, although the disease had resisted antihistaminic medication 2 A longer type of treatment was used for ulcer of the leg, ten to fifteen injections of 100 to 200 mg each day or every other day Five to 10 per cent of patients treated with metrazol show slight excitation and cerebral exaltation of a few minutes duration Treatment is discontinued two hours before bedtime so as not to interfere with sleep

## THE NETHERLANDS

*(From Our Regular Correspondent)*

AMSTERDAM, April 30, 1946

### Penicillium Expansum

Before the war van Luyke investigated the influence of extracts of Penicillium expansum on the development of some diseases of plants He found that extracts of special types of Penicillium expansum (Link) Thom produced antibiotics which he named mycomes The growth of Pythium de Baranyum Hesse could be hampered by an extract of Penicillium expansum in a dilution of 1 1 280 after five days

During the war the research was continued at the University of Utrecht in the Botany Department of Professor V J Koningsberger Penicillium expansum was raised in considerable quantities Chemical studies were made at the University of Amsterdam under the direction of Professor B C P Janden.

In February 1944 crystals of Penicillium expansum were isolated which acted on Pythium de Baranyum in a dilution of 1 16,000,000 It was called expansine and was the first Dutch antibiotic The chemical composition, as defined by Oosterhuis and Nauta, was anhydro-3-oxymethyl-4-pyron-carbonacide. After the war it was learned that Professor Raistrick in England had isolated a product called patulin from Penicillium patulum with the same chemical composition as expansine.

Expansine is very toxic and can be used only in unquents on external bacterial and mycotic diseases, such as impetigo, eczema and ringworm. Expansine is effective in infections caused by gram positive and gram negative micro-organisms Penicillin from Penicillium notatum produces therapeutic effects only on gram positive micro-organisms Research is in progress on the therapeutic effects of expansine on gram-negative organisms, such as diphtheria and tuberculosis, by reducing its toxicity for human beings

### Netherlands Society of Physiologists

The first postwar meeting of the Netherlands Society of Physiologists was held at Amsterdam on January 12. Research on the rat growth factor in butter (Boer), electrical excitability (Duyff), starvation diseases (Pompen, Groen, Merckx), alloxan diabetes (de Jongh), histamine toxicity in relation to the thymus (Overbeek), resorption of iron compounds from the intestine (Groen) and responsiveness of snail muscle (Postma) were among the subjects presented Endocrinologic interest is attached to three reports of Amsterdam workers Experiments on rats conducted for more than a year have shown that ovaries are protected from damage by exhaustion caused by the prolonged action of gonadotropins by intrinsic refractoriness against the agent limiting its action, inhibition of the occurrence of new follicles and corpora lutea in the presence of persisting structures, and transferable refractoriness, developing in the course of four weeks treatment with a gonadotropin and persisting against the same antigen for weeks afterward More than the total fertile life would be needed, according to estimates based on these experiments, to approach the goal of irreversible damage from excessive doses (Uyldert, Freud) Treatment of young male rats with old rat serum, compared with adequate controls, shows significant testicle growth inhibition This, explained on the basis of transferable refractoriness to autogenic gonadotropin, is claimed to indicate that senility in the "endocrinologic sense' might be explained by a slow development during life of refractoriness to antigenic, hypophysial and allied hormones (Freud, Uyldert) The most portentous results in mice were reported by De Vaal, who consistently showed that single injections of testosterone propionate in late pregnancy produces a female offspring with urogenital developmental anomalies (as already known) and that in this condition pubertas precox followed by pseudopregnancy regularly occurs, indicating that intersexuality and the other two phenomena are interrelated.

### Shortage of Nurses

A great shortage of nursing staff constitutes a serious handicap to our hospitals Education of nurses was impossible during German occupation in the last years of the war In addition many trained nurses left the service owing to nazi measures Thousands of patients wait for hospitalization owing to this shortage, although there is unused space in the hospitals and clinics

### Reorganization of Higher Education

During the last month the following medical appointments have been made At Leiden University G G J Rademaker professor of neurology, J Mulder professor of internal medicine, at Utrecht University A A J van Egmond became otorhinolaryngologist and J J Zoon dermatologist, at Groningen University T P van Buchem professor of internal medicine and J Ariëns Kappers professor of anatomy and embryology

### Foreign Students in The Netherlands

During the last week of March 400 foreign students are expected from various countries Some have already arrived at Amsterdam and were received by their fellow students and by state, municipal and university authorities Close contact among young intellectuals of civilized countries is a desirable contribution to spiritual and material intercourse

### Artificial Kidney

Dr W J Kolff has constructed an "artificial kidney" that may be of aid in the treatment of uremia. The apparatus maintains life until the patient's kidneys again function The patient's heparinized blood is dialyzed outside the body to remove retention products The dialyzing surface comprises 24,000 square centimeters, and the blood of a patient can be washed in one dialysis In fourteen hours 120 liters of blood can be passed through the artificial kidney, and 250

Gm. of urea washed out of the blood Creatinine, indoxyl and other azotemic products also are removed at the same time. The patient's kidneys may resume function in the five or six days after washing before uremic intoxication again threatens the patient's life. The artificial kidney has already been useful in cases of chronic uremia acute uremia and other anuric conditions

## AUSTRALIA

*(From Our Regular Correspondent)*

April 8 1946

### Elizabeth Kenny in Australia Again

Miss Elizabeth Kenny arrived in Brisbane on the *Mariposa*, April 6 She claims that her methods have been adopted and have been proved successful in Britain, America, Russia, Greece, Sweden and Spain She fears that doctors in Australia have been influenced by inaccurate reports from medical men who were in no way connected with her work. She denies that her methods are orthodox. She wants the Sister Kenny Paralysis Clinics in Queensland closed down because they are not carrying on her work. She considers that it is a farce for her name to be attached to such institutions

Miss Kenny states that she is on four months' leave of absence from the Kenny Institute in Minneapolis Three years ago she had made it known that she would return to Australia if she was invited but she never was "Anybody who doubts my treatment should produce their proof," she said

The Queensland government is sympathetic to her requests Sister Kenny Clinics had been established in Brisbane, Rockhampton, Townsville, Cairns and Toowoomba and were open to people who applied for her treatment These clinics have so far cost about £65,000 for equipment, training of nurses, rent, staff and upkeep During the last epidemic of poliomyelitis only six applications had been received for her treatment. Mr Foley, health minister of Queensland, said that "if Sister Kenny has anything to give which will help to assist sufferers, the government will be only too pleased to help her" Miss Kenny has brought back movie films of her treatment which she will release to any organization or public theater She is anxious to present her evidence to medical men in Queensland and wishes the health department to investigate her reports "in the interests of humanity" Actually, orthopedic surgeons in Australia are well informed on the results of the careful and thorough evaluations of her methods made in America These studies have amply confirmed their own conclusions

### Wartime Control of Medical Men Lifted

In the interests of national security, regulations were made during the war to provide for the allocation of medical men to the services, hospitals and civil practice Even in private practice the location was determined. Medical coordination committees were established in each state, and a central committee laid down policy and established quotas needed for each field of duty Although the powers of compulsion were limited, the committees achieved an effective and equitable distribution under great difficulties, although there were inevitable deficiencies of medical men in some areas Willing cooperation of nearly all doctors and careful consideration of each case by the committees resulted in smoothness and efficiency These controls cease April 8 Control of medical equipment and drugs continues

### Shortage of Cadavers

There is a serious shortage of cadavers for dissection at the department of anatomy of Sydney University The increased numbers of students have accentuated this deficit. There were no female subjects available Professor Burkit is announcing this difficulty in the hope that voluntary action will be taken by testamentary arrangement to supplement the meager supply made available by the health department.

### Temporary Ileac Transcecal Anus

Professor Hustin describes in the *Scalpel* an interesting technic of a temporary ileac transcecal anus which presents many advantages It is easy and safe to establish since it is really an enlarged cecal fistula, it insures a total shunting of the fecal current, it passes only formed feces not irritating to the skin, it utilizes the action of the sphincter of Bauhin's valve, thereby pooling the intestinal fluids in the terminal portion of the ileum, it does not lead to malnutrition or dehydration of the patient, the fecal current can be reestablished by a simple and safe procedure, constriction or kinking of the intestine cannot supervene. The ileac transcecal anus is to be regarded as a preliminary measure in operations on the rectum and on all parts of the large intestine with the exception of the cecum

### Professor Fleming in Brussels

The administrative council of Universite libre de Bruxelles conferred the doctorate *honoris causa* of the Faculty of Medicine on Sir Alexander Fleming, M D, F R S, at a solemn academic meeting held in the grand hall of the university on November 29 At this impressive session Professor Bordet gave an account of the work of the great British scientist. He stressed the responsibility of scientists toward humanity and pointed out that it is medicine among all the sciences which exerts the most beneficent role, ignoring boundaries and special interests in order to serve humanity without distinction of nationality

### Convention of Nurses

More than a thousand nurses from all parts of Belgium met in Brussels in a congress which discussed important and interesting questions The first session was held in the great hall of the Academic Palace Papers were read on the profession of nursing as it exists today and its function as a factor in national recovery, on the superior council of schools of nursing, on the foundation of a college of nursing and on the program of study

## Marriages

FRANK RUSSELL REYNOLDS, Wilmington, N C to Miss Marguerite Murchison Crow of Masonboro Sound, March 30

HUGH HAYNESWORTH WELLS, Holly Hill, S C, to Miss Beverly Jane Carey of Oxford, N C., in Columbia, April 9

LA RUE MERIDA MEDLIN, Bennettsville, S C., to Miss Marie Elizabeth Hammond of Fairfax in Florence, April 6

FRANKLIN P REULBACH, St. Louis, to Miss Hazel Gene Farrow of Crystal City, Mo, at Festus, March 2

JOHN RICHARD SAUNDERS JR., Richmond, Va., to Miss Caroline Virginia Doyle of McKenney, March 30

GEORGE WARREN PRATHER, New Orleans, to Miss Kathleen Elaine Halphen of Opelousas, La., March 20

LAURENCE EDWIN FLEMING to Miss Dorothy Hutchison Sarratt, both of Charlotte, N C., April 16

CHARLES MELVERN KRATOCHVIL to Miss Mary Elizabeth Pirie, both of Omaha, Sept. 3, 1945

LYON STEINE, Valley Stream, N Y, to Miss Hazel McGinnis of Altamont, Tenn., April 18.

LEO V MULLIGAN, St Louis, to Miss Elizabeth Leyse of Decatur, Ind, February 28

ROBERT B ALLENDER, Boone, Iowa, to Miss Joan Balster in Iowa City, March 24

WALDEMAR B HARTMANN to Miss Clara Zenke, both of Detroit, February 2

## MEDICAL SERVICE OF THE MERCHANT MARINE

*To the Editor* —In the April 13 issue of THE JOURNAL I note a statement made by Senator Pepper (page 1027) concerning the origin and operation of the United States Marine Hospitals that deserves some examination and comment

While the Senator's statement is somewhat sketchy, it is definitely misleading in that it creates the impression that the system devised by Congress in 1798 has continued throughout the years without change.

The facts are that in 1798 Congress did provide for the establishment of Marine Hospitals for the "temporary relief and maintenance of sick or disabled seaman" and that 20 cents should be deducted from their monthly pay The term "seamen" included men of the Navy as well as of the Merchant Marine In about 1812 naval hospitals were established for navy personnel The sum so collected went into the Marine Hospital fund and was disbursed by the various collectors of customs

In 1870 the assessment was increased to 40 cents monthly, but in 1884 Congress abolished the collection of assessments entirely and provided that the cost of maintaining the Marine Hospital Service be paid out of tonnage taxes

According to the reports of the Marine Hospital Service, the sums collected from sailors throughout the period 1798-1884 was substantially less than the cost of hospital administration—furthermore, the cost of hospital construction from the very first was provided by special acts from government funds

It will therefore be evident that the system from 1798 to 1884 was only partially supported by the beneficiaries and that subsequently the latter group was wholly relieved of any contribution and the employer group taxed for the support of the Marine Hospitals

With the passing of years, an ever increasing proportion of the maintenance charge has been from the government treasury

Senator Pepper's statement that "ever since 1798 our merchant seamen have received their medical care through services supported by social insurance and tax funds etc." is somewhat erroneous

If the record should be available the argument in Congress and discussion of the legislation in 1798 would no doubt be enlightening and interesting

RICHARD H CREEL, M D, San Francisco

## OTOGENIC BRAIN ABSCESS

*To the Editor* —I was interested to read in the issue of March 9 the report on visualization of otogenic brain abscess My interest is aroused because of my use of this method in June 1935

A man aged 55 had a slowly developing neurologic ailment which eventually resulted in right sided paresis and speech difficulty The condition was considered to be due to cerebral arteriosclerosis with probable thrombosis This opinion was concurred in by a consulting neurologist from a neighboring city, and a gloomy outlook was predicted The patient s ears showed only the scarring of old middle ear disease, the drums were not inflamed, and there was no discharge nor history of recent infection

Some days later a bloody discharge from the left ear commenced Insufficient thought was given to this development, so it was some time later before the diagnosis of brain abscess was considered. On June 26, 1935 lipiodol was introduced into the left auditory meatus, as much as would slowly flow in X-rays then were made in the anteroposterior and lateral positions An abscess cavity 2½ by 1¼ inches in diameter over the left temporal area was shown

Operation was performed on June 28 by Dr John W Holloway of Lakeside Hospital, Cleveland, and Dr C B Pride of Morgantown, W Va The skull was trephined and 3 ounces of odorless pus aspirated The cavity seemed well walled off, and a rubber drain was inserted

Convalescence was slow and the outcome much in doubt, but eventually the patient got well, physically active and with full use of his faculties, save for some deafness A year later recurrent central nervous system disturbance with coma took place. There were no localizing signs Dr Holloway again saw the patient and performed several exploratory brain punctures, but with no certain feeling that an abscess was present None was found, the patient eventually came out of coma, got well and lived a comfortable life for five more years, dying at last in a California hospital of what was possibly a recurrence of his malady

This case was not reported at the time because it seemed likely to me that lipiodol had been frequently used for such a purpose.

F R WHITTLESEY, M D, Morgantown, W Va.

## RESTLESS LEGS

*To the Editor* —In the January 5 issue of THE JOURNAL there were two communications concerning the syndrome of 'restless legs," recently described by me (*Acta med Scandinav*, 1945, supp 158) Dr Hyman I Goldstein writes that restless legs are similar to meralgia paresthetica and states that "perhaps Ekbom has only revived previously described syndromes" There is no need, however, to revive meralgia paresthetica This syndrome is well known, and a description can be found in every textbook of neurology The diagnosis is simple. It should not be possible to confuse it with restless legs In meralgia paresthetica the discomfort is described as pins and needles, burning, numbness and even pain It is felt superficially in a distinct area on the lateral aspect of one thigh, sometimes bilaterally A certain amount of sensory loss is often found at examination. The paresthesia is aggravated by standing and walking In restless legs there is an indescribable, very disagreeable, creeping, irritating feeling deep inside both legs (seldom unilaterally) between the knee and the ankle, sometimes in the thighs too The arms may be affected In some cases there is real pain The creeping sensations appear only when the legs are at rest, e. g at the cinema or in bed The victims are forced to keep their legs moving or walk about to obtain relief They may be unable to sleep for many hours No signs are found at examination Four other conditions mentioned by Dr Goldstein (akinesia algera, dysbasia angiosclerotica, Solis-Cohen's vasomotor ataxia and Osler s paresthetic meralgia) are also distinctly different from restless legs

Dr J A Winter is convinced that restless legs are "associated with either chronic nonspecific prostatitis or testosterone deficiency or a combination of the two" About half of his patients with prostatitis had restless legs This is a very interesting observation but it does not entirely explain the syndrome, for the victims are of both sexes and children also are afflicted In my normal series of healthy people 5 per cent had a mild form of restless legs Among pregnant women I found a frequency of 11 per cent, the symptoms disappearing after parturition.

## MEDICOLEGAL ABSTRACTS

**Malpractice—Volkmann's Contracture, Negligence Following Reduction of Fracture.**—The plaintiff sued for *damages to his arm allegedly caused by the malpractice of the* defendant physician. At the close of the plaintiff's evidence, the court entered a directed verdict in favor of the defendant from which the plaintiff appealed to the Supreme Court of Iowa.

The plaintiff, a 9 year old boy, fractured his right arm above the elbow and was immediately taken to a hospital, where he was treated by one of the defendant physicians, partners in the practice of medicine. The fracture was reduced, the arm immobilized in a position of acute flexion and the plaintiff's parents told that the arm would be all right, that there was nothing to worry about and that they should take the boy to the defendant's office only if the arm hurt or bothered him. The *injury occurred on a Saturday. By the next Friday morning* his arm and hand were so puffed up and swollen that the tape was cutting into his flesh and causing it to bleed, his finger nails were blue and "his elbow was swollen as big as his knee." He was then taken to the defendants' office, where more tape was put on and the mother told to put ice packs on the plaintiff's arm for three days. Three days later, when the plaintiff returned to the defendants' office, the plaintiff's mother was told that the boy "had a slight contracture" but that "there was nothing much a person could do, just let it heal and wait until the swelling went down." He did add more tape, however. During the next month or so the plaintiff was taken to the defendants' office about twice a week but no tape was ever loosened or removed, in fact more was added on almost every visit. Prior to the removal of the tape the plaintiff's hands, according to his mother, "began to take a funny shape, didn't look like a hand, began to draw down, and some of his nails came off." She asked the defendant about this condition and was told that the boy would have to go to the University Hospital at Iowa City "for a little correction." Five weeks after the fracture occurred, the tape holding the arm in acute flexion was removed. Much of the skin and flesh came off with the bandage, 'great gobs of pus was laying there on the tape, and his arm was just one mass of it." The doctor took gauze and cleaned off the worst of it and told the mother to take Ivan home and wash the arm off with soap and water. He put no dressing on the arm at this time. It was not until January that the sores caused by the bandages had healed sufficiently for the plaintiff to be taken to the hospital at Iowa City, where he underwent an operation and remained hospitalized for six months. During the next two and a half years the plaintiff returned to the hospital nine times, once for four months, again for three months, for five weeks and for shorter periods. Three serious operations were performed on these visits to the hospital, and for more than two years the plaintiff wore a brace or corrective apparatus day and night.

The defendants conceded that the plaintiff was suffering from a deformity known as Volkmann's contracture, a condition in which the muscles of the forearm are lost to further use and are replaced by fibrous tissue, resulting in a permanent *deformity sometimes* called a claw hand. It was the plaintiff's theory that, when his arm and hand became swollen, the exercise

of reasonable care required the defendant physicians to remove or at least loosen the bandage, or widen the acute angle of flexion in which the arm was held, and that their failure to do so was negligence which was the proximate cause of his deformity The court said that the jury could have found from the evidence that the plaintiff was obviously in danger of suffering a Volkmann's contracture when he was taken to the defendants' office on the Friday morning following the accident One of the plaintiff's experts testified that 'the symptoms (of Volkmann's contracture) are puffing, swelling, blue finger nails, which would indicate the arterial blood supply is going down and not coming back," and another said that "swelling puffed hand and blue fingernails" were symptoms of the Volkmann's contracture which followed These are the symptoms, said the court, which according to the undisputed evidence the plaintiff exhibited to the defendants on Friday morning Furthermore, the testimony showed the imperative need for prompt treatment when the aforementioned symptoms were present The medical witnesses substantially agreed that forty-eight hours after the circulation is obstructed is ordinarily about the maximum time that a Volkmann's contracture could result, with six hours about the minimum The court said that there was thus substantial evidence to support the plaintiff's theory and that the trial court should have submitted the case to the jury

The medical testimony on which the plaintiff most relied was given by a witness from a town about 25 miles from Waterloo This witness, said the court, was not disqualified from testifying as an expert merely because he did not live in Waterloo since the evidence showed that he knew the degree of skill and care exercised by physicians in Waterloo and similar localities On the issue of negligence, this witness stated " I would say the standard in that case would be to take the arm loose and re-x-ray it and see what was wrong loosen the bandage and change the degree of flexion, possibly extend it. " In this he was corroborated, at least in part, by another expert witness whom the defendants conceded to be a qualified practitioner in Waterloo When asked as to the proper and average practice in that locality, this witness said "They would probably alter his bandage sufficiently to lessen the acuteness of the flexion, and place the arm at rest, and probably apply ice or cold packs of some nature, in order to cut down on the swelling The recognized treatment, if the radial pulse is diminished any appreciable amount, *or* there is cianosis [cyanosis], bluish discoloration of the hand, *or* marked swelling, is to reduce the flexion the acute flexion, to a point where the radial pulse becomes somewhere near normal" In other words, the court indicated, this plaintiff's expert witness said, in substance, that the flexion should have been widened if there was bluish discoloration of the hand or marked swelling two symptoms which the plaintiff exhibited on Friday morning The only treatment administered on that day however, was the application of more tape to hold the arm in place, even though the original bandage was cutting into the flesh until it bled, and the suggestion that the mother apply ice packs for three days By clear implication if not expressly, the defendant told the plaintiff's mother that it would not be necessary to see the boy again until the end of the three day period On the following Tuesday, after ice packs had been applied for three days, the boy was taken to the doctor, who then admitted 'that Ivan had a slight contracture He said there was nothing much that a person could do just let it heal and wait until the swelling went down. This is consistent, said the court, with the testimony of one of the plaintiff's experts that "it can be a permanent disability when it isn't taken care of right away" and with the plaintiff's contention that it was then too late to remedy the condition by cutting the tape so that the hand could be lowered 2 inches Accordingly the court concluded that there was sufficient evidence not only that it was negligent for the defendants not to relieve the flexion in which the arm was held or remove or loosen the bandage but that such negligence was the proximate cause of the plaintiff's unfortunate deformity

Accordingly the court concluded that the trial court erred in not submitting the case to the jury reversed the judgment for the defendant and remanded the case to the trial court.—*Bartholomew v Butts 5 N W (2d) 7 (Iowa 1942)*

# Current Medical Literature

## AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1936 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied with stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

### American Heart Journal, St. Louis

**31** 115-252 (Feb.) 1946

*Pericarditis with Effusion Following Infections of Upper Respiratory Tract. D. A. Nathan and R. A. Dathe.—p. 115
*Hemiplegia Following Carotid Sinus Stimulation. J. M. Askey.—p. 131
Transitory A-V Block Occurring During Scarlet Fever. W. D. Paul, C. Rhomberg and Julia Cole.—p. 138
Rate and Control of Blood Flow Through Skin of Lower Extremities. R. H. Goetz.—p. 146
Electrocardiographic Changes in Cases of Infectious Hepatitis: Study of 11 Cases Occurring in an Epidemic. H. Dehn, H. Feil and R. E. Rinderknecht.—p. 183
Method for Construction of Vectorcardiogram from Einthoven Electrocardiogram. F. H. Howard.—p. 191
Differences in Blood Pressure Values Determined by Inflating and Deflating Cuff of Sphygmomanometer. R. S. Cunningham.—p. 220

**Pericarditis with Effusion Following Infections.**—Nathan and Dathe report 8 cases of acute pericarditis with effusion observed at their army installation. The diagnosis in 5 cases was based on a pericardial friction rub associated with severe substernal pain which was the initial complaint in each. Leukocyte counts varied from 6,000 to 27,400 per cubic millimeter. Significant recession of the cardiopericardial shadow was demonstrated in 5 cases. Pericardiocentesis, which was performed in 5 cases, revealed hemorrhagic fluid in 4 and a clear amber fluid in 1. Slide film, culture and guinea pig inoculation of the pericardial fluid were negative for bacteria in all cases. The commonest change in the electrocardiograms was a progressive inversion of the T waves, straightening of the ST segments in 7 cases and the elevation of the ST segments in 5 cases. Two possibilities are considered as to pathogenesis: (1) the proximity of the hilar lymph nodes with extension of the infection into the pericardial sac and (2) a hypersensitive response by the pericardium to an offending organism in which the immune reaction of the body is inadequate. This parallels the present accepted explanation of a hypersensitive reaction on the part of the heart and serosal linings of the joints in the rheumatic fever state.

**Hemiplegia Following Carotid Sinus Stimulation.**—According to Askey, 7 instances of hemiplegia occurring immediately after carotid sinus stimulation were reported by members of the California Heart Association. This communication includes 10 cases and is submitted as a joint report. Of the 10 cases only 7 presented sufficient evidence that the hemiplegia was a direct result of mechanical stimulation of the carotid sinus. From an analysis of the first 7 cases it is apparent that mechanical stimulation of the carotid sinus is not as innocuous as is generally believed, and it may be followed by more or less serious paralysis. The great majority of the patients were elderly and had arteriosclerosis and hypertension. It would appear therefore that, although stimulation of the carotid sinus may be harmless in young people, the procedure should be utilized with caution in elderly persons with arteriosclerosis.

### American J. Digestive Diseases, Fort Wayne, Ind.

**13** 33-58 (Feb.) 1946

Carcinogenic Value of Oxidated Oils: Sunflower Oil. A. H. Roffo.—p. 33
Incidence of Appendicitis from Survey of College Students. K. A. Stiles and F. W. Mulsow.—p. 39
Endocrine Aspects of Obesity. M. A. Goldzieher.—p. 40

### American Journal of Diseases of Children, Chicago

**71** 113-210 (Feb.) 1946

Behavior Problems in Children. H. Bakwin.—p. 113
Outlines for Well Baby Clinics: I. Recording Development of First Twelve Months. C. A. Aldrich and Edith S. Hewitt.—p. 131
*Multiple Sclerosis in Childhood. H. R. Carter.—p. 138
*Congenital Biliary Cirrhosis. I. Dunsky.—p. 150
Pathologic Study of Acutely Inflamed Human Pharynx in Influenza A Infection. J. M. Adams, M. M. Pennoyer and A. M. Whiting.—p. 162

**Multiple Sclerosis in Childhood.**—A survey of 711 cases diagnosed as multiple sclerosis at the Neurological Institute of New York over a period of eleven years revealed that there were 2 girls aged 12 years at the onset (before menarche), 2 girls aged 13 (with one year of menstruation) and 1 boy aged 10 at the onset. There were ages at onset of 14 and 15 in 2 boys and 2 girls. There was a sharp increase of cases between 16 and 17, some 64 in number. The girls outnumbered the boys. Carter cites reports from the literature which indicate that in the greatest number of cases the onset occurs between the ages of 21 and 30, with the 31 to 40 decade coming next. Whereas in adults multiple sclerosis presents a fairly clearcut picture of chronic multiple lesions of the central nervous system following a course of remissions and exacerbations, a wider scope of variations is revealed in the clinical symptoms of multiple sclerosis in children. The author presents illustrative cases of 4 children between the ages of 9 and 13 years at the onset. A sudden and fulminating onset is illustrated in the first case, while the slow insidious onset is shown in the second and third cases. The fourth case exemplifies a third type of onset with an associated retrobulbar neuritis, as mentioned by Ford and Adie. Therapy for children with multiple sclerosis is at the same impasse as that for adults.

**Congenital Biliary Cirrhosis.**—Dunsky reports the occurrence of hepatic diabetes in association with a rare case of biliary cirrhosis in a young infant in whom melituria was first noted in the second week of life. The exclusion of pancreatic diabetes was possible when the infant was 2 months old on the basis of an intravenous tolerance test. At necropsy it was found that pathologic changes were limited to the liver. The pathologic picture was that of a biliary cirrhosis with associated renal involvement. The probability of galactemia and galactosuria is considered.

**Congenital Glaucoma Following Maternal Rubella.**—Guerry recently observed a boy and a girl, both aged 3 years, with congenital glaucoma whose mothers had had German measles during early pregnancy. This suggests that such an anomaly may be a common sequel of German measles and that careful inquiry into the history of all cases of congenital glaucoma may reveal the history of rubella in many

**Lipoma of Corpus Callosum**—List and his associates present a tabulation of previously reported cases of lipoma of the corpus callosum and report 2 additional cases The clinical symptomatology is not pathognomonic but the diagnosis can occasionally be made by observing the x ray appearances of increased radiolucency of the tumor, calcification, demonstration of an expanding mass in the anterior part of the corpus callosum and agenesis of the posterior portion of this structure. Surgical treatment is contraindicated

**Abdominal Lymphogranulomatosis**—Craver and Herrmann detected symptoms referable to the gastrointestinal tract in 13 per cent of 406 cases of Hodgkin's disease These symptoms may be produced by primary secondary or extrinsic disease of the gastrointestinal tract. Primary Hodgkin's disease of the gastrointestinal tract is a distinct entity whose treatment is surgical Secondary involvement of the gastrointestinal tract may be asymptomatic and discovered only at necropsy Gastrointestinal manifestations from secondary involvement or extrinsic Hodgkin's disease are usually a late occurrence and are found most frequently in the long lived patients If gastrointestinal symptoms appear early in the course of a generalized Hodgkin's disease the life expectancy as a rule is exceedingly short. The clinical picture in some instances may resemble that of appendicitis Roentgen therapy may give considerable symptomatic relief in the cases of secondary or extrinsic Hodgkin's disease of the gastrointestinal tract but there is no evidence that the life expectancy is increased

**Symptomatology of Schistosomiasis Japonica**—The occurrence of several hundred cases of schistosomiasis japonica among military personnel following the American reoccupation of Leyte, Philippine Islands, beginning in October 1944 has provided a group of patients with this disease who were available for study during the late incubation period and during the acute and early chronic stages For comparison there have been many natives on Leyte, Mindoro, Mindanao and Samar who have been exposed to single or multiple infections and usually exhibit a relatively advanced stage of the disease The inoculum consists of the viable forktailed larvae the cercariae, capable of penetrating human skin and initiating an infection The quantity of the inoculum differs in endemic areas seasonally and in different locations, depending on the number of cercariae released by the snail hosts Wading only ankle deep in infested water, especially if pants are carefully tucked inside well laced combat boots, provides relatively scant opportunity for exposure Wading up to the armpits and bathing or swimming in infested water constitute heavy exposure hazards Within a few minutes after skin exposure to schistosomiasis japonica a person may experience sharp needling pain at the sites of penetration of the fork tailed cercariae The physical weakness and mental lethargy, loss of appetite and loss of weight, pain and stiffness in the leg muscles, small of the back and neck, the headache, the intermittent chilly sensation followed by fever each night, the abdominal fulness and tenderness in the right hypochondrium—all of these are relatively constant features of the disease as it approaches the end of the incubation period The onset of the acute stage occurs at the time the mature, fertilized female worms are beginning their egg laying and the eggs are filtering through the intestinal wall usually to be evacuated in the stool within a period of a few days This stage lasts for three to four months and is gradually transformed into the early chronic condition During the acute state the disease may be (1) fulminating, (2) severe with sudden onset, (3) insidious and (4) asymptomatic Recovery of the eggs of Schistosoma japonicum constitutes the only reliable method of specific diagnosis Since the eggs are not deposited until the worms mature, only a tentative diagnosis can be made during the incubation period.

**Airborne Fungi in Allergic Disease**—Bieberdorf and Hampton report the results of a twelve months survey of airborne molds at the Regional and Convalescent Hospital of the Army Air Forces Personnel Distribution Command, San Antonio, Texas The study was conducted by means of exposure plates and exposed microscope slides coated with petrolatum Mold spores were found in the air almost every day Certain mold groups occurred as dominant forms, and nine of these constituted over 90 per cent of the molds encountered as shown by the exposure plate method. Hormodendrum and Alternaria had a higher incidence than any of the other genera by the exposure plate method, whereas Alternaria and Helminthosporium were most frequently observed in the exposed slide studies Routine intradermal skin tests with extracts of the molds encountered in this survey were done on patients with various allergic diseases One hundred and eighty-six, or 12.28 per cent, of the 1 515 patients with proved allergic disease and only 6 of 488 normal controls skin tested during this period showed definite reactions with one or more of the mold extracts when tested in strengths of 1 000 protein nitrogen units per cubic centimeter or less All but 6 of the 186 were cases of respiratory allergy (hay fever, vasomotor rhinitis and bronchial asthma) Thirty of the 186 patients reacted negatively to tests with all common pollen and inhalant extracts

**Lipoid Pneumonia in Adults**—Sodeman and Stuart report 2 cases of lipoid pneumonia in adults A man aged 49 had been hospitalized eleven times, usually for bronchopneumonia superimposed on chronic lung disease. Diagnoses of tuberculosis, Boeck's sarcoid, fungous diseases and bronchiectasis were considered. A diagnosis of osteochondroplasia plastica was finally established by bronchoscopy At the same time a specimen of sputum stained with sudan III disclosed the presence of fat. Questioning revealed that the patient had been taking agar-agar and liquid petrolatum daily as a laxative for twelve years and used an oily nasal spray for four years Necropsy disclosed extensive lipoid pneumonia. The second patient, a man aged 63 in whom the clinical picture simulated carcinoma of the lung had taken an ounce of liquid petrolatum five or six nights each week for some years to avoid constipation. A pneumonectomy was done for suspected carcinoma The pathologic specimen showed the characteristic changes of lipoid pneumonia.

*Treatment of Severe Pustular Dermatoses and Staphylococcic Septicemia by Oral Administration of Penicillin. E. L. Pfuetze and H G Nelson—p 128

**Lemon Grass Oil as Primary Irritant.**—According to Mendelsohn lemon grass oil is distilled from grasses that are indigenous to India It contains not less than 70 per cent aldehydes, the chief aldehyde being citral The principal use of the oil is for manufacturing ionone, a synthetic perfume. He reported an outbreak of an acute eruption resembling poison ivy dermatitis in approximately 30 men, presumably due to lemon grass oil These men had worked as machinists, carpenters and riggers on a boat which had recently arrived from India. Part of the cargo consisted of tanks of lemon grass oil, some of which had spilled and evidently had found its way to different parts of the boat. His experiences with patch tests with three lemon grass oils and three ionones on 20 patients with various dermatoses revealed that lemon grass oil from any source, with a citral content of 75 per cent or over, is a primary irritant, in a dilution of 1 10 it is a sensitizing agent Alpha, methyl and extra pure ionones are non irritating and, in all likelihood, nonsensitizing

**Oral Penicillin in Pustular Dermatoses and Staphylococcic Septicemia.**—Pfuetze and Nelson report 2 instances of severe pyogenic dermatitis One patient, with severe pustular dermatitis, was treated successfully with oral administration of penicillin, following two relapses with sulfadiazine therapy and intramuscular administration of penicillin This patient was given ten penicillin calcium tablets (200,000 units) every hour for four doses, or until forty tablets had been taken. This was followed by seven tablets every two hours for the first twenty-four hours Thereafter five tablets were given every two hours during the daytime for the next fourteen days The second patient had a severe generalized pustular dermatitis complicated by a hemolytic staphylococcus septicemia This patient likewise responded dramatically to the oral administration of penicillin No toxic effects from the penicillin were noted with the dosages given.

## Blood, New York

**Intravenous Administration of Massive Doses of Iron in Hypochromic Anemia**—Elemental iron from 0 608 to 1 32 Gm was given intravenously in one injection either as colloidal ferric hydroxide or as colloidal ferric oxide to each of 8 patients with hypochromic anemia. The reticulocyte response, rate of hemoglobin regeneration and percentage of utilization were followed. Three subjects without anemia were used for control observations The reticulocyte response was higher in each instance than would be expected in oral therapy In 3 additional patients in whom injection had to be discontinued after 0 070, 0 180 and 0 123 Gm of elemental iron had respectively been given the reticulocyte rises were higher than were the average responses reported by Heath after optimal oral therapy This suggests that "optimal" oral therapy does not provide a maximal stimulus to outpouring of reticulocytes from the bone marrow Comparable doses of iron given to 3 control subjects with normal hemoglobin levels did not cause a reticulocytosis Calculations indicated that from 71 8 to 99 7 per cent of the injected iron was apparently used for the synthesis of hemoglobin. These figures are likewise lower than they would have been if several of the patients had not lost blood during the recovery period The observation of other workers that parenterally administered iron is almost completely retained by the body and converted into hemoglobin was therefore confirmed Toxic reactions to the injected iron were severe in all but 2 instances and were so alarming in 3 cases that injection had to be discontinued. The reactions to large doses of iron parenterally administered are great enough to contraindicate the use of this measure as a therapeutic procedure.

**Erythroblastosis Fetalis in the First Born.**—According to Levine and Waller isoimmunization by the Rh factor occurs in two groups of cases, namely (1) Rh negative persons after repeated transfusions of Rh positive blood and (2) Rh negative

women immunized by Rh positive fetal blood In a third group both factors, transfusions and pregnancy, are operative This paper deals mainly with selected cases of the third group in which isoimmunization was initiated by transfusions and, after a variable interval, became intensified through pregnancies The authors stress that the incidence of fatal forms of erythroblastosis fetalis in the first born can be diminished by the simple measure of transfusing all Rh negative female patients, even as infants, with Rh negative blood Once a female patient is found to be Rh negative, all subsequent transfusions must be carried out with Rh negative blood The indications are that sufficient human anti-Rh serums will become available for the more extensive Rh tests required for the prevention of isoimmunization by transfusion

**Salmonella Epidemic from Sandwiches** —Greenblatt and his associates say that during a four day period in February 1944 there were 97 soldiers admitted with gastroenteritis to the station hospital of an army camp of several thousand men Most patients recovered clinically within six days There were no fatalities Admissions were from all areas of the camp Interviews with 57 patients established that, with 2 possible exceptions all had eaten sandwiches at the post exchanges and clubs in the camp area. Several kinds of sandwiches were involved, the only item in common being the mayonnaise used as a spread. Cases of similar illness occurred during the same period at three other army installations using sandwiches from the same source The sandwiches were commercially prepared in an establishment which made its own mayonnaise by mechanically mixing fresh eggs, cottonseed oil sugar salt and spices Sometimes the mayonnaise was kept without refrigeration The possibility existed of four days incubation at room temperature following manufacture of the mayonnaise. The isolation and identification of the Salmonella organism from very early stool specimens in almost all cases regardless of the severity of symptoms suggest that the patients had ingested a large number of viable bacteria. The source of infection of the mayonnaise could not be determined Sulfaguanidine administered to a small group of patients had no apparent effect. Convalescent patients excreted the organism for as long as thirty-eight days This epidemic emphasizes the danger of mayonnaise handled at room temperature Most present day commercial manufacturers of sandwiches use such a product as a spread and in their salad preparations

**Cadmium Food Poisoning** —Garber describes an outbreak of gastroenteritis in an Air Forces squadron in New Guinea The outbreak began with nausea, vomiting, retching and abdominal cramps A few patients had a mild diarrhea Many had a considerable degree of collapse Twenty-seven men had to be hospitalized Since a lemonade mixture was the only common denominator, samples were submitted for analysis Arsenic and mercury were proved absent and no trace of antimony could be detected. A small amount of yellow precipitate was obtained with hydrogen sulfide, which failed to dissolve in sodium polysulfide This suggested the presence of cadmium. The lining of the metal container in which the lemonade was prepared was examined Cadmium was the only member of the copper-tin group found In view of this and the clinical aspects of the outbreak, it appears highly probable that cadmium poisoning was the cause Cadmium poisoning follows contamination of acid foods and drinks with soluble cadmium compounds Cadmium poisoning should be suspected in an outbreak of gastrointestinal disturbances in which there is a short interval between the ingestion of food and the onset of symptoms, particularly when there is a history of an acid fruit mixture made in a metal container

Percutaneous Tuberculin Therapy in Behavior Disorders of Children R R Gutstein —p 113

**Deep Burns Involving Bones** —Early treatment of burned bone consisted in combating shock and correcting derangement of the body fluids, cleansing the involved areas and applying pressure dressings After the first ten days or two weeks the dressings were changed daily or every other day and debridement of necrotic tissue was done at each dressing Whenever enough slough was partially separated, an anesthetic was given and excision was done The slough was usually off within one to three weeks The surrounding viable soft tissues should be grafted as soon as possible without waiting for the bone to separate The dead bone does not interfere with the take of

split grafts and it can be removed a few weeks later Within about ten days after removal of the bone the bed would be covered with granulations Grafting was done again at this time if the area was large or was allowed to heal spontaneously if small Amputation of some phalanges was necessary when they were burnt completely through, but often the burns extend just partially through the bone and amputation can usually be avoided

**Absorption, Distribution and Excretion of Streptomycin in Man.**—Buggs and his associates studied the absorption and excretion of streptomycin following systemic injection and oral administration in 22 persons Doses of 25,000 to 500,000 units were given intramuscularly or intravenously, and doses of 500,000 to 2,000 000 units were given orally Generally after intramuscular or intravenous injection about 50 per cent of the dose was excreted in the urine within twenty four hours Streptomycin was not absorbed from the gastrointestinal tract following a single dose of 500 000 units, but traces appeared in both blood serum and urine after doses of one and two million units Doses of 500,000 units given either intramuscularly or intravenously every six hours, seemed to maintain a serum level adequate to combat bacteria whose growth is inhibited by concentrations of 5 to 7 5 units of streptomycin per cubic centimeter of culture medium The serum concentrations during the first few minutes after intravenous injection of streptomycin were much higher than those attained following a similar dose administered intramuscularly However, by the end of one hour the serum concentrations were approximately equal whether the drug had been given intravenously or intramuscularly At the end of the fourth hour the concentrations following the intramuscular injection were found to be slightly higher than those following the intravenous injection. No streptomycin was found at the end of three hours in the spinal fluid after a single dose of 500 000 units given intramuscularly or intravenously When administered intrathecally in doses ranging from 10,000 to 20 000 units, streptomycin was detected in the spinal fluid Streptomycin was found to penetrate into the peritoneal cavity in early cases of peritonitis following intravenous injection of 500 000 units Streptomycin was detected in ascitic fluid following injection Like penicillin, streptomycin injected intramuscularly did not penetrate into empyema cavities in therapeutic amounts, although traces could be detected in the pus A number of patients complained of flushing of the skin, a sense of fulness in the head or headache shortly after the intramuscular or intravenous injection of a large dose of streptomycin. Thirteen of 45 patients who received streptomycin therapeutically for one to eighteen days complained of generalized muscular aching weakness or pain in the joints Three of these patients developed drug fever, and a rash occurred in 2 All these symptoms cleared when the drug was discontinued

*Treatment of Causalgia Analysis of 100 Cases T B Rasmussen and H Freedman—p 165

**Treatment of Causalgia.**—The 100 patients with causalgia treated by Rasmussen and Freedman were Chinese soldiers who had been wounded in the Burma campaigns The upper extremity was involved in 82 and the lower in 18 patients. The major nerves of the extremity were involved in 81 of the 100 patients and in 10 there was injury only to bones or joints There was injury only to soft tissues in 5 patients and injury to cutaneous or digital nerves in 4 The characteristic pain appeared within six hours after the injury in 48 cases and within one to three days in another 23 In a few cases its appearance was delayed up to eight weeks Fifty-five of the patients described the pain as hot or burning in character, while the remaining 45 did not associate any sensation of temperature with the pain Since the rest of the clinical picture of these 45 patients was so nearly identical with the others, it seemed obvious that the same pathologic process was involved Diagnostic paravertebral injection of procaine was done in 91 of the patients, producing complete temporary relief of pain in 73 great relief in 16 and no relief in 2 of the patients From the therapeutic standpoint, paravertebral injections of procaine produced complete and permanent relief of pain either immediately or within four weeks after the injections in 13 of the 91 patients Moderate relief of pain was produced in 32 patients, while in the remaining 46 the relief of pain produced by the injections alone was inadequate Postganglionic operations for causalgia of the arm resulted in immediate complete relief of pain in 5 patients and complete disappearance of all pain within one month after the operation in an additional 5 There was gradual disappearance of the pain several months after the operation in 4 patients, and in the remaining 7 patients in this group of 21 some residual pain persisted throughout the follow-up period. Preganglionic operations for causalgia of the arm were done in 14 patients with immediate complete and permanent relief of pain in 13 The remaining patient in this group obtained great immediate relief followed by complete disappearance of the residual pain during the first month after the operation The results of sympathectomy for causalgia of the leg were not quite as satisfactory as for the arm Four of the 5 patients in this group continued to have some residual pain

**Thiouracil**—Larochelle and Jobin used thiouracil in the preoperative management of 29 patients with hyperthyroidism at the medical service of the Hotel-Dieu from September 1944 to July 1945 Twenty-nine control patients were treated with Lugol's solution Twelve of the patients treated with thiouracil and 11 of those treated with Lugol's solution had toxic diffuse goiter, the other patients had vascular goiters or toxic adenomas with increased basal metabolic rate Twenty-eight females and 1 male between the ages of 9 and 67 years were treated with thiouracil, and 26 women and 3 men between the ages of 19 to 57 years were treated with Lugol's solution The mean basal metabolic rate of the patients treated with thiouracil was plus 40 per cent and that of the patients treated with Lugol's solution was plus 45 per cent. The daily dose of thiouracil was 0 75 Gm and was administered in three fractional doses of 0.25 Gm one hour after meals The patients treated with Lugol's solution received 10 drops three times daily The duration of the treatment varied from three to twenty-two days The patients treated with thiouracil were hospitalized for an average period of 7 1 days and those treated with Lugol s solution for 6 6 days

Actual Causes of Certain Occupational Dermatoses II Further Study of 532 Cases with Special Reference to Dermatitis Caused by Certain Petroleum Solvents J V Klauder and Marjory K. Hardy —p 168

**Bacteriostatics and Medical Problems in Burns**—According to Leonard, each of the adult patients from the Hartford circus fire was given sulfadiazine by mouth Unfortunately the catastrophe coincided with excessively hot and humid weather This tended to accentuate the oliguria, and many patients showed red blood cells in their urine, while in a few gross hematuria developed. The use of sulfonamide drugs was therefore discontinued within twenty-four to forty-eight hours in all cases On discontinuance of sulfadiazine penicillin was used prophylactically and therapeutically The author thinks that several patients would have died or at least would have had dangerous sepsis if it had not been for the liberal use of penicillin parenterally It seems difficult to explain the rarity of invasion of the blood stream entirely on the basis of the careful aseptic technic. Despite the preliminary use of sulfadiazine followed by penicillin, staphylococci and nonhemolytic streptococci flourished beneath the dressings It is well known that penicillin given parenterally cannot reach organisms in necrotic tissue which has lost its blood supply and penicillin was not employed locally Treatment of the hypochloremia consisted in the addition of 3 to 12 Gm of sodium chloride to the diet or in its being given intravenously as isotonic solution of sodium chloride if the patient was still vomiting The problem of anemia was met by the frequent use of whole blood and suspensions of red cells Hypoproteinemia made its appearance in spite of a high protein diet, but amigen in 10 per cent solution with or without dextrimaltose was masked in soups and broths and disguised in fruit juices so that the total protein intake was increased to from 125 to 300 Gm a day in almost every case Diets were supplemented with vitamins Patients burned about the head often became irrational and needed oxygen therapy and considerable sedation

**Air Embolism Following Uterotubal Insufflation.**—Faulkner feels that dangerous departures from the proper technic of uterotubal insufflation have crept into medical practice The most serious of these is the use of air as an insufflation medium instead of oxygen or preferably carbon dioxide as stipulated by Rubin. The author describes 2 deaths from air embolism which resulted when air was used for insufflation Air may be introduced into the peripheral veins through a break in the mucosa of the uterine cervix or cavity Report of these accidents from improperly performed uterotubal insufflation does not mean that one should turn to uterosalpingography with opaque mediums as a routine practice. The ideal totally harmless opaque medium has not yet been introduced.

**Fractures of Patella**—Fett and Mackby found that in only 2 of 8 cases in which they performed patellectomy has there been the return of function which one might be led to expect It is the belief of the authors that patellectomy is indicated in fresh compound comminuted fractures, in comminuted fractures, in old fractures that have healed in malposition or have been incompletely reduced, leaving irregular articular surfaces and thus producing traumatic arthritis, and in some cases of hypertrophic arthritis of the knee joint in which it is believed that the patella is causing a mechanical block and is a factor in the production of pain Patellectomy is a procedure which has been called radical and condemned by many authorities The technic is simple and, if performed early and followed by the proper rehabilitative measures, will yield gratifying results in carefully selected cases It must not be used as a routine measure in the treatment of all fractures of the patella

**Penicillin Lozenges in Vincent's Stomatitis**—Lozenges containing 750 units of pure penicillin sodium were developed The first patients were treated by Strong and Willett on April 6, 1945 Since that time over 400 patients with Vincent's infection have been treated with these penicillin lozenges and every patient has had complete recovery The actual length of time before smears have been negative has varied between forty-eight and one hundred and twenty hours, according to the severity of the case and the amount of tissue involved Within twenty-four hours the patients have remarkable relief from pain and discomfort and can actually resume the mastication of food The foul odor of the breath, so typical of the disease, has disappeared along with the necrosed and sloughed tissue. Most patients require from 30,000 to 50,000 units of penicillin

**Ammonium Chloride in Prevention of Diethylstilbestrol Nausea.**—Hudgins points out that the most common side effect of diethylstilbestrol is nausea and occasionally vomiting The nausea may cease after a few days without change in dosage or following reduction of the dose. However, if it continues, 0 65 Gm of ammonium chloride after meals and at bedtime will aid in control and thus allow continuation of diethylstilbestrol therapy

**Folie à Deux in Uniovular Twins Reared Apart**—Craike and his associates describe 2 uniovular twin sisters aged 52 who were separated at the age of 9 months, were brought up in different families in different parts of the country, met each other for the first time at the age of 24 and never lived together or had any close contact with one another One had a stable home with an affectionate maternal aunt, the other lived with a drunken and violent father of whom she was terrified Both were nervous as children, both stole as children or adolescents One at the age of 19 and the other at the age of 18 had some form of gastric disturbance, accompanied with indications of a neurotic aspect, which in each case passed off rapidly Both went into domestic service. Neither married Both have become gradually deaf and both imply that the other merely pretends it Paranoid symptoms appeared in each at about the same time, soon after their first meeting Despite the religious interests of the twins, neither shows a religious coloring to the mental content The principal difference between the psychoses is that, while one shows a chronic insidiously progressive paranoia, the other shows paranoid symptoms only episodically, and it is tempting to relate the different degrees of severity to the more fortunate upbringing and early life enjoyed by the second one Each sister centers her delusions around the other, this appears in one of them to be reactive to the accusations of the other It is this mutual involvement in a paranoid system of delusional ideas which suggested the title "folie a deux" Both twins are regarded as being the subject of a basically schizophrenic illness

**Penicillin Treatment in Infected Pleural Effusions**—Fatti and his associates review observations on 24 patients with acute infected pleural effusions *Treatment with penicillin* was instituted in 14 while the pneumonic symptoms were still present

and in 10 after this phase had subsided The success or failure of the different technics was assessed by comparison of the results with those in 14 controls treated along accepted lines Aspiration followed by injection of penicillin was used in 7 cases, with 2 successes and 1 partial success This method was abandoned early in the series except for small interlobar effusions The 3 cases in which rib resections were done were failures in that the total lengths of illness and time from drainage were of the same order as those of the controls This method of treatment was abandoned In the 10 cases treated with intercostal drainage and instillation of penicillin there were 7 successes, 2 partial successes and 1 failure The technic depends on the use of aspirations and of injections of penicillin as soon as the effusion is recognized, followed, once it becomes purulent, by intercostal drainage alternating with instillation The choice of a systemic or local dose depends on whether or not the toxemic phase is passed and the infection well localized.

Report of Fatal Case of Blast' Injury of Spinal Cord. D Leslie —p 188

**Rupture of Liver in the Newborn**—Arden describes the treatment of a male infant hospitalized two days after birth because of pallor, breathlessness and inability to suck. His abdomen was slightly distended and dull on percussion all over the right side and in the left flank. Blood transfusion was started immediately One cc. of a vitamin K preparation was injected intramuscularly The transfusion was of immediate benefit but the abdomen remained distended On the assumption that the liver was the most likely organ to be involved, the abdomen was opened by a right upper paramedian incision. The peritoneal cavity was found distended with blood and blood clot, and exploration revealed a deep fissure, 2 inches long in the anterosuperior surface of the right lobe of the liver Owing to the friability of the liver attempted closure of the gap with mattress sutures proved unsatisfactory The fissure was so fortunately placed that it was possible to suture the torn edges of the liver capsule to the cut edges of the parietal peritoneum This had the effect of shutting off the peritoneal cavity from the source of the bleeding and rendered the oozing laceration in the liver subject to control by external pressure. A strip of the right rectus abdominis muscle, with a pedicle at the lower end, was placed in the fissure in the liver substance and the abdominal wall was closed Firm pressure was applied by strapping over dressings Apart from some postoperative vomiting and slight delay in wound healing, the baby made an uneventful recovery

**Intraspinal Procaine Anesthesia**—Kunlin, who first used intraspinal procaine anesthesia in 1942, has employed this technic for posterior commissural myelotomy and total myelotomy, using 0 5 to 2 cc. of a 1 per cent procaine solution. The anesthesia is complete for twenty to thirty minutes, disappearing rapidly after that. Nupercaine prolongs the anesthesia. All pain is suppressed, the advantages of local anesthesia are preserved The method is valuable for other interventions on the spine or spinal roots, particularly removal of radicular or intramedullary tumors

**Otitis Media of Newborn.**—Lévy-Solal and his associates performed paracentesis for otitis media on 11 newborn infants In 5 intervention was done between the tenth and twelfth day of life in 2 on the fifteenth day and in 4 between the twentieth and twenty-first days Otitis media may occur from the tenth

day of life onward There is a paucity of symptoms The infant may refuse once or twice to take the breast, and there may be a slight loss in weight Frequently there is a tendency to hypothermia rather than to a febrile course. In rare cases there may be vomiting If the otitis media is diagnosed in time and incision of the tympanic membrane is made at once, the majority of the infants, even though premature and weak, will recover Early diagnosis and early treatment are the safest prophylactic measures against marasmus in the course of the first weeks or months of life. This condition may be due to infection of the ear and to antritis rather than to any hereditary tuberculous or syphilitic infection or to alimentary disturbance A systematic examination by the otologist of the tympanic membrane of the newborn with an abnormal curve of weight is suggested for maternity wards, infant asylums and nurseries

**Bronchial Tuberculosis and Collapsotherapy**—Dumarest and his associates' observations of 5 cases of bronchial tuberculosis suggest that collapsotherapy and particularly pneumothorax are contraindicated in the presence of lesions caused by stenosis of the large bronchi The artificial collapse aggravates and accelerates the process of stenosis Consequently dilatation of the adjacent bronchi occurs, causing infection and retention, from which definite blocking of the lung results

**Local Application of Penicillin in Diphtheria.**—Roch and Doret vaporize 1 cc of penicillin solution in the throat of diphtheria patients and 0 5 cc. in each nostril by means of a spray The solution contains 1,000 units per cubic centimeter The spraying is repeated three times a day Bacteriologic controls are made in the morning, the last spray having been given the night before After two negative controls the local treatment is interrupted for four days and then another test is made. If the future confirms the results obtained so far, this local penicillin treatment will permit a considerable reduction of the quarantine period in diphtheria The authors do not wish to substitute local penicillin treatment for the serum treatment of diphtheria but rather to combine the two

*Acute Hepatitis in Light of Clinical and Laboratory Examinations. S G Jokipii —p 294

**Poliomyelitis Complicating Pregnancy**—Waaler reports 8 cases of poliomyelitis in pregnant women between 18 and 38 years of age Seven cases occurred during an epidemic in Bergen, Norway, *in 1941, the eighth case occurred in 1944* There were two fatalities The author observed that poliomyelitis is not more severe in pregnant women except during the last months of pregnancy, when there may be great discomfort if the respiratory muscles are involved The prognosis is probably worse for the mother in late pregnancy The disease has little influence on pregnancy and labor Labor is usually normal, and cesarean section is indicated only when paralysis embarrasses the respiration or when genitourinary complications are *serious It seems likely that poliomyelitis is more frequent in* pregnant women than in other adults, and the cases hitherto observed have been uniformly distributed among the various stages of pregnancy No evidence has been produced of intrauterine transmission of poliomyelitis Of this series 5 newborn infants did not show any sign of paralysis or malformation Follow-up investigation of age showed that all children were well and that they had learned to walk at the usual age. In *1 case of stillbirth with spontaneous labor* there was a history of previous stillbirth and no evidence that poliomyelitis was responsible. Microscopic examination of the nervous system of the fetuses of the 2 mothers who died in the sixth and eighth month respectively of pregnancy did not reveal any abnormality

**Acute Hepatitis**—Jokipii reports 262 cases of acute hepatitis observed at the Third Medical Clinic of the University of Helsinki during the years 1942 to 1944 The patients were between the ages of 18 and 60 years No age or sex disposition was noted The intensity of jaundice was fairly high, as demonstrated by the Meulengracht reaction and by Heilmeyer's extinction coefficient obtained directly from the serum Ehrlich's reaction and Schlesinger's test were positive in 242 cases (92 4 per cent) in the initial phase of the disease, they were negative in only 20 cases (7 6 per cent) but turned positive when the yellow pigmentation became less pronounced The normal color of the feces returned in one week and bilirubin disappeared from the urine in 177 cases (67 5 per cent) in one week The erythrocyte sedimentation rate was normal in 153 cases (58 per cent), it was low in 109 cases but returned to normal when jaundice faded Recurrences occurred in 28 cases (10 7 per cent), in 12 of which the color of the serum had not returned to normal at the time of discharge (two weeks) Rest in bed for three to four weeks, until bilirubin and urobilin reactions are negative and the sedimentation rate is normal, may prevent recurrences

# Book Notices

**Intelligence and Its Deviations** By Mandel Sherman Ph D M.D Professor of Educational Psychology The University of Chicago Chicago Psychology Series Albert T Poffenberger Ph D Editor Professor of Psychology Columbia University New York Cloth Price $3 75 Pp 286 with 19 illustrations New York Ronald Press Company 1945

In this book the author undertakes to treat "the medical, psychological and social aspects of" intelligence for the benefit of the pediatrician, the medical student and the psychologist. He covers this field by discussing, first, the theory of intelligence and general intellectual development The conditions essential to growth and functioning of intelligence—the individual's endowment and environment—receive two chapters These are followed by chapters on the relation of intelligence to delinquency and to psychosis There is exposition of mental deficiency, including its relation to specific brain changes The entities epilepsy, mongolism and retinism receive separate treatment, and these are followed by the topics of mental testing adjustment of the mentally deficient, genetics and "superiority" including genius

The merits of the book lie in the broad surveys it offers of the field of intelligence the clinical groups in which the deviants distribute and the patterns it follows in these groups together with something as to the conditions medical and environmental, peculiar to each. Some of these chapters are excellent, serving especially a satisfying refresher purpose Others are scanty and the exposition correspondingly unsatisfying Thus there is an interesting review of intelligence testing and its history generally and of the nature nurture problem with a valuable discussion of the fallacy in relating delinquent and mental deficiency

There is a surprising neglect of the important work done especially in recent years in mental deterioration Nor is adequate justice being done to investigation of intellectual functioning in psychosis more especially in schizophrenia. There is emphasis, for example (p 125), on the "neurological basis of intellectual deterioration in the functional' psychoses ' The alternative view of schizophrenia as an adaptive maladjustment, one facet of which is the apparent "dementia," receives no mention In fact the volume ignores entirely this aspect of the adapting organism, utilizing its abilities sometimes in ways destructive to it with the resulting atrophy of ability One misses in this connection mention of the valuable work by Norman Cameron in the brain damaged and in schizophrenia, by Vigotsky in concept formation, Halstead's current contributions based on his critical investigations in patients with lobotomies and that of Kurt Goldstein and his followers in breakdown of abstract thinking in schizophrenia.

One specific criticism It is hard to see why the author felt it necessary to include chapter 15, on intellectual superiority, basing it as he does only on the reconstruction by Terman and his associates of the "intelligence quotients of John Stuart Mill Faraday, John Adams, Lincoln, Ben Johnson and other 'geniuses"

For all these criticisms this book is a useful well organized survey of the field. It is well documented with graphs and tables A glossary is helpful The bibliography is extensive. It is unfortunate that the author has included so little of his own experience or of his critical reactions Nevertheless the little volume will be useful in the library of the professional man who must deal with intelligence as a technical problem and needs a compact reference source at hand.

**The Effect of Smallpox on the Destiny of the Amerindian** By E Wagner Stearn Ph D and Allen E Stearn Ph.D Cloth. Price $2 50 Pp 153 Boston Bruce Humphries Inc 1945

The authors of this book, professors of bacteriology and chemistry respectively at Christian College and the University of Missouri have attempted to answer their personal question as to vaccination of their own child by study of source material. During the course of their studies they were impressed with the effect of smallpox on the "Amerindian ' This volume, which is presented as the result of a year of research based on study of source material consulted in libraries at the University of California, Stanford University and the Barcroft Library at Berkeley, Calif, portrays the devastation which smallpox wrought among the various Indian tribes as they were being pushed back by the constant pressure of the white man It attempts to make a semiquantitative estimate of the extent to which smallpox uncontrolled through vaccination reduced the population of the tribes, impaired their capacity to resist and may even have been used as a weapon of subjugation The reader cannot be surprised at the conclusions of the authors that smallpox was a factor of consequence and that vaccination when ultimately introduced and accepted late in the nineteenth century protected the small remnant of Indians, but he can be surprised that the authors should have taken so cumbersome and uncertain a method to convince themselves of the value of vaccination The material is presented in strictly chronological fashion, which portrays the magnitude of the smallpox problem in successive years but lacks an orderly sequence of events as far as they concern a particular tribe or area The data refer almost exclusively to the tribes in what is now the United States scanty reference is made to the Canadian tribes and none to those of Mexico or of Central or South America as might have been expected from use of the term "Amerindian." The book represents an interesting and valuable collection of information but is by no means a searching or exhaustive study of the role of smallpox in the depletion of the Indian population More extensive use of original source material and quotations from these sources would have added to its value and its readability

**The Physiology of the Newborn Infant.** By Clement A. Smith M D Professor of Pediatrics Wayne University College of Medicine Detroit Michigan Cloth Price $5 50 Pp 312 with 36 illustrations Springfield Illinios Charles C Thomas Publisher 1945

This excellent monograph covers the fetal and neonatal aspects of respiration the circulatory system including the fetal circulation and its alterations at birth, also fetal and neonatal blood volume, dynamics of circulation and other important phases The blood and its various components and changes from the fetal stage through the neonatal period, icterus neonatorum inclusive of hepatic insufficiency, metabolism and heat regulation, the physiology of the digestive tract, fetal and neonatal nutrition assimilation and metabolism of minerals and vitamins, renal physiology inclusive of regulation of electrolytes and water, neonatal endocrinology and neonatal immunology are all covered in a detailed analysis of our present knowledge of these subjects The bibliography is exceptionally complete. This book can well be recommended to pediatricians obstetricians and others interested in various fields of clinical research.

**Hackh s Chemical Dictionary [American and British Usage] Containing the Words Generally Used in Chemistry and Many of the Terms Used in the Related Sciences of Physics, Astrophysics Mineralogy Pharmacy Agriculture Biology Medicine, Engineering Etc. Based on Recent Chemical Literature with Numerous Tables Diagrams Portraits and Other Illustrations** 1946 Printing with changes and additions of third edition edited by Julius Grant M Sc Ph.D F.R I.C. Fabrikold. Price $8 50 Pp 925 Philadelphia & Toronto Blakiston Company 1946

This is a revised and edited third edition, the original of which was reviewed in THE JOURNAL, Sept. 30, 1944 The price has been lowered and the book contains recent data on atomic disintegration. Some of the definitions of medical words, e. g digitalis, which were considered unsatisfactory by the reviewer of the third edition are still inadequate. This book continues to serve as a good reference work for terms used in chemistry and allied subjects

**What You Can Do for Angina Pectoris and Coronary Occlusion** By Peter J Steincrohn M D F.A C.P Cloth Price $2 50 Pp 254 Garden City N Y Doubleday & Company Inc. 1946

This little book is written for nonmedically trained persons who have angina pectoris or have had a coronary occlusion Its purpose is to discuss the nature of the conditions, the prognosis and management at greater length than can be done personally by most physicians In general the information is accurate, but there are a few casual observations made for the sake of public appeal for which the evidence is slight. For example, on page 30 it is stated that "the heart does more flip-flops than it did during the stolid altercations of the cave man days' It is perhaps a little unfair to pick out such a single example because most of the book gives accurate information which should be of assistance both to the patient and to his physician

## MEDICAL AND SURGICAL TREATMENT OF GASTRIC AND DUODENAL ULCER

*To the Editor* —Is recurrence of stomach ulcers a rule? Do ulcer patients have to stay on a diet all their life? Is surgery or conservative treatment preferable?

M D New Jersey

ANSWER.—Gastric ulcers show a high incidence of recurrence but not as high as duodenal ulcers Gastric ulcer presumably is different from a duodenal ulcer Roentgenologically, on healing, scarring in contrast to the classic scarring which results from healing of duodenal ulcer is not evident The deformities of duodenal ulcer may persist throughout life without activity Because of the complete healing of gastric ulcers, a patient may not have to stay on a diet all his life. However, patients should be cautioned to refrain from overindulgence in tobacco, coffee, condiments and alcohol, which stimulate hyperplastic parietal cells to secrete more hydrochloric acid than can be properly buffered by food, saliva and mucus (the mucus has little if any buffering capacity)

Whether surgery or conservative treatment is preferable remains a question Some investigators believe that irrespective of the modern medical treatment of gastric ulcer, the incidence of carcinoma is much too high when compared with the low morbidity and mortality from surgical treatment.

In a young person conservative management may be tried If the patient is at or about the carcinomatous age his best chance may be through the surgical route, notwithstanding our ability to control the healing of gastric lesions by both roentgenologic and gastroscopic observations The final differential between a benign and a malignant ulcer must rest on the microscopic findings

## POSSIBLE SENSITIVITY TO MOLD IN ROQUEFORT CHEESE

*To the Editor* —I treated a man with a diplococcus infection and a corneal ulcer using penicillin instillations He developed a severe reaction to the penicillin and some time later an infection in the eye again I used penicillin ointment in the eye and he again had a definite reaction in the eye I gave him two injections of 15 thousand units of penicillin after which he broke out in a severe rash over the entire body A month or so later he had eaten Roquefort cheese containing some of the mold He developed a rash after eating the cheese I understand that the mold in Roquefort cheese is Penicillium Is there any relation between the mold in Roquefort cheese and the Penicillium notatum from which the commercial penicillin is made?

A F Jensen M D Grand Forks N D

ANSWER.—It would be impossible for any one to say whether the mold in the Roquefort cheese which was eaten by the patient was in any way responsible for the development of the rash. It would be interesting to know whether or not penicillin given by mouth could produce an eruption in this patient. Some of the molds in Roquefort cheese belong to the Penicillium group, but since penicillin is a product of the metabolism of the mold it is not known whether there are cross reactions between penicillin and the mold itself This is a subject for future investigation

## NASAL POLYPS

*To the Editor* —Are any efficient procedures available to prevent the return of nasal polypi after surgical removal and if so what are they?

E W Telford M.D De Kalb Ill

ANSWER.—Nasal polyps do tend to recur after surgical removal no matter what methods are used or how carefully or completely one operates The chief factors responsible for their return are the presence of a chronic suppurative sinusitis and the allergic state itself Every attempt should be made to treat these conditions as completely as possible and, in addition if one wishes to avoid recurrences, radium may be used postoperatively by a qualified roentgenologist. Other postoperative methods to avoid a return of polyps are the use of zinc ionization of the nasal mucosa and electrosurgical removal of the polypoidal growths

## SEX INTERGRADE

*To the Editor* —At the birth of a child two years ago it was noted that the external genitals were abnormal and the parents were told to have the sex determined when the child was 2 years old Externally at the penile site an erectile organ was found measuring 1 inch in length without an external opening Underneath was an opening surrounded by labia which opened into the bladder A normal vaginal opening was not found On exploratory laparotomy no vagina was seen An organ apparently a prostate was found with tubes leading off and attached at ends were small white masses On biopsy of part of this whitish tissue four histologists concurred in saying that it was testicular tissue The parents have been raising the child as a girl and are now at a loss as to what to do Any answer to this problem or reference to information will be greatly appreciated

M.D California

ANSWER.—It would seem that the best program for a child like this would be as follows

1 He should be raised as a boy and not as a girl

2 When the child is 4 years old, an attempt should be made to correct the hypospadias Apparently, from the description, the child has a penis

3 Because testicular tissue is absent or almost so, it would seem that as far as endocrine therapy is concerned the gonadotropins would be of little value, and therefore the child might be started on small doses of androgen (at least 50 mg a week and possibly more, depending on the response of the patient to this therapy) This should be started at 4 years of age, and in all probability it will be necessary to continue it indefinitely The androgen can be given by mouth in the form of methyl testosterone, but intramuscular injections of testosterone propionate are much more preferable in the beginning If the genital growth becomes definite and the child begins to develop some of the signs and symptoms of puberty, the injections will obviously have to be discontinued for a reasonable time. Whether or not the small amount of testicular tissue present in the abdomen could be placed in the scrotum cannot be determined from the inquiry

## AURICULOVENTRICULAR BLOCK

*To the Editor* —What is the best treatment for first degree auriculoventricular block The PR interval in this patient's cardiogram is 0 24 second

M.D California

ANSWER.—First degree auriculoventricular block is a condition in which the auriculoventricular transmission time is prolonged but every impulse reaches the ventricles The PR interval, which is the electrocardiographic measurement of auriculoventricular condition, must exceed 0.21 second before first degree block should be diagnosed.

There are a number of causes of this condition, of which digitalis is the most frequent example. Acute infections, especially rheumatic fever and diphtheria, may cause a prolonged PR interval Coronary artery sclerosis is the third major cause. Occasionally vagal reflexes may produce first degree block, and in such cases it may be produced or accentuated by carotid sinus pressure Other less frequent causes are congenital anomalies, quinidine and syphilis involving the junctional tissue.

Therefore, first degree auriculoventricular block is not a disease but is to be considered only a sign of disease, and treatment should be directed at its underlying cause. If digitalis or quinidine is at fault, the drug should be omitted or the dose reduced If due to specific diseases such as rheumatic fever or diphtheria treatment should be directed to the disease and not toward the sign of prolonged auriculoventricular conduction In coronary artery disease associated with myocardial infarction prolongation of the PR interval tends to be transitory and, with healing, many cases return to normal When syphilis is the inciting agent, therapy for syphilis must be administered with great caution

## TREATMENT OF EPILEPSY

*To the Editor* —A man aged 23 has had epilepsy for three and one half years At the onset the seizures were frequent but under treatment they have been reduced to one every several weeks Treatment has consisted in a strict ketogenic diet phenobarbital sodium ¼ grain (0 05 Gm) morning and night and thiamine hydrochloride 100 mg intravenously once weekly Please discuss further treatment

Willis P Baker M D Santa Ana Calif

ANSWER.—The ketogenic diet is not as effective in adults as in children, nor is phenobarbital usually as effective as diphenylhydantoin (dilantin) sodium for the control of convulsive seizures This medicine is dispensed in capsules containing 0 1 Gm. Three to five capsules may be given daily

## SYMPATHECTOMY IN THE TREATMENT OF PERIPHERAL VASCULAR SCLEROSIS

GEZA de TAKATS M D
EDSON FAIRBROTHER FOWLER M D
PAUL JORDAN M D
Chicago
and
CAPTAIN THOMAS C RISLEY
Medical Corps Army of the United States

The causes of and effective measures against arteriosclerosis are highly debatable and mostly not understood For a general review of the vast amount of experimental and clinical research on this subject we refer to the exhaustive critical review of Hueper [1] Unquestionably, as this author points out, a fatalistic attitude prevails toward its prevention and treatment In a recent monograph on arteriosclerosis Moschcovitz [2] came to the conclusion that "unless the individual is cut down by intercurrent disease death is invariably the result of arteriosclerosis It is the inevitable destiny of all creatures who possess a cardiovascular system with intravascular pressure Arteriosclerosis being an inevitable consequence of aging and therefore an irreversible process, it is hardly likely that any method of therapy will ever be discovered which will restore the diseased vessels to their normal texture, unless we can cure mortality Nor can arteriosclerosis be prevented, no more than gray hair or facial wrinkles"

It was exactly this type of attitude which we took when scattered reports of sympathectomy for peripheral arteriosclerosis of the lower extremities began to appear in the literature [3] Our indications for sympathectomy in peripheral vascular disease were tabulated in 1937, and, since it was believed that sympathectomy is useful only in vasospastic states with or without an organic component, arteriosclerosis had not been considered In fact one of us (G de T ) felt that it was an unnecessary type of surgery which discredited the excellent results obtained in Raynaud's disease, Buerger's disease and many other vasospastic phenomena

Two observations, however, changed our pessimistic attitude on this subject It was noted, following the communications of Atlas [4] and of Freeman and Montgomery,[5] that patients with obliterative vascular sclerosis could walk farther after a paravertebral sympathetic block with procaine, their claudication improved while under the effect of the block In addition, some of them exhibited angiospastic phenomena while walking, which was abolished by a paravertebral block [6] More impressive yet was the following case history

J P, a man aged 45, a pedler of Russian-Jewish extraction, was admitted to Research and Educational Hospitals on Dec. 7, 1940 His difficulty in walking started five years previously, but ever since his late twenties he had had "rheumatic" pains in the calves He had no other complaints on admission except that after two blocks cramping in the left calf became so severe that it was necessary for him to stop After a few minutes he could start walking again He smoked heavily

On admission he was given our routine cardiovascular work-up consisting of a thorough physical examination, the study of the eyegrounds, an electrocardiogram, a 2 meter chest film, a concentration-dilution test and a paravertebral sympathetic block The only positive findings were a closed left radial artery and closure of both popliteals with well pulsating femoral arteries Neither the eyegrounds nor films of the thighs showed any arteriosclerosis The blood cholesterol was 210 mg per hundred cubic centimeters of blood The blood pressure was 140/80 mm of mercury

Because of his age, race, heavy nicotine intake, lack of vascular sclerosis elsewhere and mainly because of the closed radial artery, which is frequent in Buerger's disease and seldom occurs in arteriosclerosis a diagnosis of a late, burned out thromboangiitis obliterans was made Since a paravertebral block raised the temperature of all toes and increased his walking ability from 300 to 900 steps, a left lumbar sympathectomy was performed

The operation was done with the usual anterolateral muscle-splitting extraperitoneal approach, and the left lumbar sympathetic trunk was removed between the brim of the pelvis and the lumbocostal arch On palpating the aorta we felt large oval atheromas, making the diagnosis of thromboangiitis untenable. The patient had unquestionably a presenile atheromatosis

Not only did the patient's left lower extremity remain warm and dry, but his walking ability rose to 6 blocks, at which time cramping became obvious in his right extremity, not operated on Four years later he still maintained this result.

This observation, shortly followed by others together with the convincing article of Trimble and his associates, which appeared in April 1944,[7] encouraged us to extend the use of lumbar sympathectomy to patients

suffering from arteriosclerosis Obviously case selection seemed very important and we shall define briefly our indications for operation in this type of patient

CASE SELECTION

Both thromboangiitis obliterans and arteriosclerosis may produce a diffuse involvement of the entire vascular tree, but even in arteriosclerosis the involvement may predominate in the lower extremities with surprisingly little involvement elsewhere Visceral involvement is studied with funduscopy an electrocardiogram, a 2 meter chest film and a concentration-dilution test Films of the thigh may detect calcification, although many atheromatous occlusions lack medial classification Severe cerebral, cardiac or renal involvement naturally contraindicates any surgical attack on the vascular occlusion of the lower extremities A patient who has had a coronary occlusion should not be subjected to a lumbar sympathectomy, but angina on effort is not a contraindication although it must be recognized that, when claudication improves, cardiac burden increases

A paravertebral sympathetic block must precede all lumbar sympathectomies The increase in skin temperature of the digits the improvement in walking ability and the shortening of the venous filling time are observed after paravertebral block with procaine just as in cases of thromboangiitis obliterans [8] When the digits do not warm up after sympathetic block but remain cold or show a paradox drop in temperature sympathectomy may precipitate gangrene, as in the cases reported by Atlas [4] It is our conviction that such an occurrence can be predicted and avoided by the measurements of digital temperature While in Buerger's disease with its usually abundant collateral circulation a paradox drop in skin temperature calls for a minor amputation combined with sympathectomy, we have very seldom resorted to this combination in sclerotic patients Certainly minor amputations in arteriosclerotic patients are tolerated very poorly with the exception of the diabetic gangrenes of infectious background [9]

The arterial occlusion—mostly caused by ulcerated atheromas with superimposed thrombosis or an occasional embolus from an aortic plaque—is at popliteal, femoral or iliac levels Closure of both femoral arteries with claudication in gluteal or genital areas with sexual weakness is rather characteristic of an aortic occlusion, which, since it occurs gradually, is perfectly compatible with fair nutrition of both lower extremities Such patients, if their terminal vascular bed is intact, experience benefit from a sympathectomy, whereas a diffuse arteriolar sclerosis, with relatively little involvement of the major arterial pathways, is unsuitable for operation

As Louis G Herrmann pointed out in his monograph on passive vascular exercise,[10] this is the kind of patient on whom suction and pressure therapy fails This is equally true of intermittent venous hyperemia, which we have routinely used for all our patients suffering from organic arterial occlusions and which is much more effective in the sympathectomized extremity, since reflex vasoconstriction originating from venocapillary distention is abolished [11] One can state then that the higher occlusions are not necessarily more refractory to surgical treatment, provided the terminal bed is not concomitantly involved Clinically the postural changes of color (pallor on elevation, rubor on dependency) indicate poor flexibility of the capillary bed and capillary stasis

There is one other criterion which may help to decide for or against sympathectomy in a given case We mention this, however, with hesitation, since it is not measurable and is purely subjective It is the relief of pain, which is very striking in some patients, entirely absent in others The relief of pain may be due in some instances to an infiltration of the lumbosacral plexus with procaine and is thus due to a sensory, not a sympathetic, block The relief of pain, however, may be observed in cases of severe ischemic neuritis which act not unlike a causalgic state and which may well be due to a volley of sympathetic impulses acting on demyelinated sensory fibers [12] The hot, burning pain of this neuritis, which is aggravated by heat relieved by cold and elevation occurs in arteriosclerotic patients with and without diabetes It is often accompanied by severe diffuse osteoporosis [13] Such patients mostly require amputation for the intractable pain, but a trial with a sympathetic block is sometimes rewarded by a cessation of pain, permitting a sympathectomy Ordinarily the pain has been allowed to persist so long that the patient is addicted to narcotics and the pain can be interrupted only at higher sensory levels [13]

Age per se, is not a contraindication, but obviously common sense must prevail The number of our sympathectomies done on patients over 60 years of age is seven, the oldest patient being 66 years old Whether this age group would fare better with paravertebral blocks of alcohol is very doubtful We used this method in our earlier experience [14] but have abandoned it, since infiltration of somatic nerve elements, plexuses or undivided anterior primary rami occurs, and while the percentage of this mishap is not too great (2 to 3) the crippling effects are disheartening In 1 arteriosclerotic patient aged 72 years in whom a paravertebral alcohol block was done elsewhere a permanent foot drop developed, together with an intractable burning pain corresponding to the distribution of the third and fourth lumbar segment Two of our own patients had ilioinguinal and genitofemoral neuralgia and quadriceps weakness for many months For this season our clinic has abandoned the use of paravertebral alcohol injections in spite of recent favorable reports [15]

Briefly, then, our indications for sympathectomy in arteriosclerosis of the lower extremities may be summed up as follows

INDICATIONS FOR SYMPATHECTOMY IN PERIPHERAL ARTERIOSCLEROSIS OF THE LOWER EXTREMITIES

In patients with popliteal, femoral or aortic occlusions who show a favorable response to paravertebral block with procaine and whose visceral vascular involvement is subclinical or

slight (no hemiplegia, no coronary occlusion, no advanced nephrosclerosis) The age group between 40 and 50 is most favorable.

In patients without and often with diabetes, whose chief complaint is continuous intractable burning pain associated with osteoporosis who obtain relief from paravertebral block and who otherwise would require a supracondylar amputation (a causalgic state)

## THE MATERIAL STUDIED

The material studied consisted of 25 patients [15a] Their age varied between 39 and 66 years They were placed in the category of the vascular sclerotic because of (1) definite evidence of sclerosis elsewhere, (2) no history of segmental phlebitis or arteritis in earlier years, no involvement of radial arteries, or (3) high pulse pressure, hypertension, hypercholesteremia or hyperglycemia.

While there was occasionally difficulty in separating a late burned-out case of thromboangiitis obliterans approaching the age of sclerosis from a presenile atheromatosis without calcification, the cases can usually be kept apart The borderline case must be treated alike anyway, dependent on the activity of the process, on the collateral involvement and on the site of occlusion (whether arterial or arteriolar)

Of the 25 patients, 6 were from St Luke's Hospital, 11 from the Research and Educational Hospitals and 8

TABLE 1—*Lumbar Sympathectomy for Peripheral Vascular Sclerosis*

| Age Groups | Number of Cases |
|---|---|
| 38 to 50 | 12 |
| 50 to 60 | 11 |
| 60 to 66 | 2 |
| Total | 25 |

from the Veterans Facility at Hines, Ill There was 1 patient below 40, 15 patients were between 40 and 50, 11 patients were between 50 and 60 and 2 patients were over 60 years (table 1)

Of the 25 patients retinal sclerosis was present in all, coronary sclerosis in 18, previous coronary occlusion in 2, nephrosclerosis in 5, hypertension in 10 and lipemia in 3 (table 2) The average walking ability before the operation ranged from half a block to two blocks, indicating the severity of the disease encountered The average postoperative walking ability ranged from one block to several miles Since this type of improvement lends itself poorly to statistical inquiry, a few illustrative cases are presented in more detail

CASE 1—R E. S, a man aged 51 a mail carrier, developed a sudden popliteal occlusion due to popliteal atheromatosis He could not walk more than 300 feet Left lumbar sympathectomy was done within a few weeks His walking ability is now unlimited he has resumed his work as a mail carrier The duration of follow-up has been one year

CASE 2—R. A, an amusement park operator, could walk less than one block without pain His job required a great deal of walking He was obese with a blood cholesterol of 320 mg per hundred cubic centimeters Following bilateral lumbar sympathectomy he could walk three hours continuously without pain

CASE 3—G H R, a man aged 44, had had symptoms of intermittent claudication for six years He had lost his left leg previously at the midthigh His preoperative walking distance was three fourths of a block and he had rest pain at night A diagnosis of chronic aortic occlusion was made. Following right lumbar sympathectomy he can walk from two and one-half to three blocks His toes and foot do not get numb now, but a mild ache develops in the calf The foot is warm and dry The duration of follow-up has been ten months

TABLE 2—*Lumbar Sympathectomy for Peripheral Vascular Sclerosis*

| Degree of Involvement (20 Cases) | |
|---|---|
| Retinal sclerosis | 25 |
| Coronary sclerosis | 18 |
| Coronary occlusion | 2 |
| Hypertension | 10 |
| Nephrosclerosis | 5 |
| Lipemia * | 3 |

Blood cholesterol over 2.50 mg per hundred cubic centimeters

CASE 4—A N, a man aged 49, a laborer, had claudication for several years, completely incapacitating him for any work. He had bilateral lumbar sympathectomy on Sept. 28 and Oct. 22, 1943 and could be reexamined several times, the last time two years after operation His walking ability increased from two to four blocks Both feet are warm and dry He is doing indoor work, and his feet seem well protected from the effects of minor injuries

CASE 5—S V, a man aged 66, a carpenter, had a left lumbar sympathectomy on May 16, 1944 for severe obliterating arteriosclerosis occluding the femoral artery His right leg was then pulseless, but he had no complaints regarding it. He came back a year later with a warm dry left foot and good skin texture The right foot (previously the better foot) had become frankly gangrenous and had to be amputated

CASE 6—J W, a man aged 55 a veteran had lost his left leg previously because of obliterating arteriosclerosis His right lower extremity became intractably painful and ulcerated Circulatory tests revealed the proper level of amputation to be above the knee, and a Callander-type of amputation would have been ordinarily performed In order to save his knee joint a preliminary sympathectomy was done which permitted a lower-leg amputation A well vascularized stump was obtained

These 6 case histories illustrate the different situations which were met in this series There are many others but they mainly group themselves as follows (table 3)

GROUP 1—Middle aged sclerotic patients with a walking ability of a few blocks The texture and color of their skin is normal Popliteal or femoral pulses are absent Lumbar sympathectomy has greatly improved

TABLE 3—*Lumbar Sympathectomy for Peripheral Vascular Sclerosis*

| Grade | Claudication | Trophic Change | Result |
|---|---|---|---|
| 1 | 2-6 blocks | None | Improves walking |
| 2 | ½-2 blocks | Capillary stasis digital sclerosis | Prevents gangrene |
| 3 | Few steps | Ulceration gangrene | Permits lower amputation |
| 4 | Intractable rest pain | Glossy edema osteoporosis | Stops pain prevents amputation |

their walking ability, occasionally for unlimited distance Of 9 patients in this group 2 showed more angina on effort since they could walk farther

GROUP 2—Middle aged or elderly sclerotic patients Walking ability ranged from one-half to two blocks Evidence of some arteriolar and capillary stasis was present, in addition to the major arterial occlusion Operation was mainly undertaken to prevent gangrene.

15a A report on additional material is now in preparation

Postoperatively their walking ability did not improve appreciably Nevertheless not a single patient developed gangrene on the sympathectomized side, while 2 patients lost their legs which had not been operated on, which were originally the better ones Ten patients belong to this group

GROUP 3—Patients requiring amputation or who had already lost one leg by amputation A preliminary lumbar sympathectomy enabled us to do three toe amputations and three lower leg amputations with a type of circulation which in our previous experience necessitated a supracondylar amputation Six patients belong to this group

GROUP 4—A type of patient which, because of intractable pain, diffuse osteoporosis and glossy edema, we believe belongs to the causalgic state Such patients have closed arteries and are in an advanced stage of arteriosclerosis with or without diabetes Their intractable symptoms have previously indicated amputation The peripheral nerves are demyelinized in segments The deep tendon reflexes are diminished or absent If sympathetic block relieves the burning, throbbing pain, sympathectomy is indicated Five patients belong to this group and not one has lost his leg so far This group is not unlike the one met in certain patients suffering from trench foot or air-hammer disease and seems to be due to an ischemic neuropathy and not to sympathetic paralysis

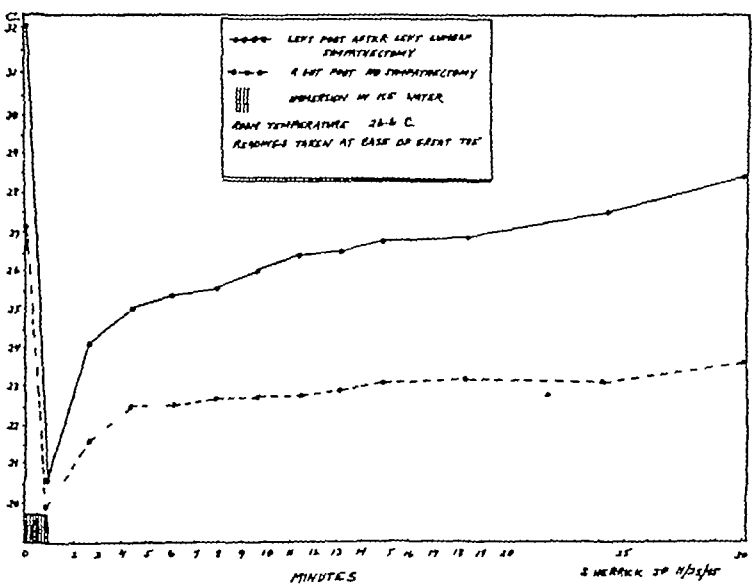

Fig 1—Effect of ice water on the sympathectomized extremity Solid line drop and recovery of toe temperature after immersion of sympathectomized foot into ice water for one minute, interrupted line control extremity not operated on exposed to identical conditions Note that the sympathectomized limb warms up much faster than the one with intact vasomotor apparatus Readings on a patient with obliterating arteriosclerosis whose left sympathectomized limb showed more severe involvement.

## COMMENT

In analyzing the effects of sympathectomy on an extremity crippled by arteriosclerosis, one must not expect a decided increase in basal blood-flow By basal blood-flow we mean the amount of blood per hundred grams of tissue as measured by a plethysmograph under basal conditions Our plethysmographic studies undertaken with a modification of Abramson's method by Donald Miller were interrupted during the war [10] But it became obvious that the basal blood-flow determined on patients without breakfast, after thirty minutes of rest, were greatly influenced by emotional stimuli, drafts and painful stimuli, all of which are known to activate the peripheral sympathetic outflow Lumbar sympathectomy then frees the extremity from such fluctuations, which are of surprising magnitude While the sympathectomized vessel reacts to the direct effect of cold by constriction, it warms up faster exposed to warmth, on the other hand it cools off more slowly having lost its vasomotor tonus Reflex effects of heat and cold, however, are ineffective on the circulation of a sympathectomized extremity Thus such a limb behaves as it would under a heat cradle surrounded by a temperature around 85 F, a temperature which abolishes vasomotor tone but which would be difficult to obtain on this continent continuously, even on the southern tip of Florida (fig 1)

One can state then that the sclerotic individual, provided he protects himself from the direct effects of cold by warm wool socks and suitable footwear, maintains a circulation in his sympathectomized extremity in a Midwestern or Eastern climate which he would otherwise obtain only in a warm, semitropical environment The beneficial effect of such climates on patients suffering from peripheral vascular disease is sufficiently known

This effect of vasomotor palsy is well recognized and need not be further discussed Much less attention has been drawn to the fact that the vasomotor tonus in the sitting and more in the standing position is high in the lower extremities This is one of the mechanisms, notably the first line of defense, which maintains man's blood pressure in the erect position That such postural vasoconstriction unfavorably affects a diseased vascular tree is obvious This postural vasoconstriction is eliminated by lumbar sympathectomy so that vasomotor tonus is not any higher than in the horizontal position This is not to say that the terminal vascular bed cannot contract on being distended by blood, that is, the intrinsic muscle tonus of the vessel reacts to stretch just as much as it reacts to cold after sympathectomy Nevertheless, the shifting of blood which occurs in the standing person away from the depending portions of the vascular tree cannot take place

It is curious that the second great therapeutic aid (the first being the even, warm climate) in the treatment of organic vascular lesions, namely rest in bed in the horizontal position, can be supplied to an ambulatory patient by sympathectomy, since it removes the excess vasomotor tone of the erect animal, man (fig 2) Physiologists working with quadrupeds have frequently denied the lasting benefits of sympathetic denervation to the circulation of an extremity but obviously could not study this factor (fig 3)

While intrinsic muscle tone is regained after a while in the sympathectomized vessels, our group showed several years ago that the venocapillary stretch produced by intermittent venous hyperemia is far more effective in the sympathectomized limb than in the extremity in possession of its vasomotor apparatus [11]

Finally a last, insufficiently understood effect of sympathectomy must be mentioned, namely the striking effect of paravertebral block and also of sympathectomy on the constant burning pain which ischemic limbs exhibit, whether this ischemia is due to thromboangiitis, to arteriosclerosis or to an embolic occlusion This is

10 Miller D S and de Takáts G Posttraumatic Dystrophy of the Extremities Sudeck s Atrophy Surg Gynec. & Obst. 75 558 1942

not to say that every case of ischemic neuritis is benefited by sympathetic interruption, since this is not the fact It is well known that poorly vascularized extremities suffer a demyelinization of their somatic nerve fibers and give rise to intractable pain, loss of motor

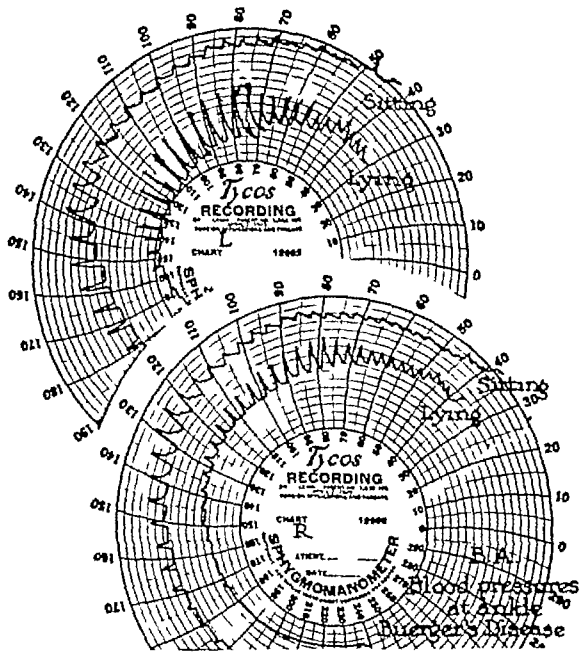

Fig 2—Effect of gravity in the lower extremities of a patient suffering from Buerger s disease. This patient has been selected for study since in the sclerotic ankle pulsations are hardly ever obtainable. The upper graph obtained from the left, less involved, extremity shows a shift of the curve to the left because of rise in peripheral resistance and a decrease in pulse volume On the right side with more advanced vascular impairment the rise in peripheral resistance is again obvious but the size of the spikes is not so striking because the vessels show less pulsatility

function and loss of reflexes This is especially pronounced in the diabetic neuropathies,[17] in which metabolic factors may play an additional role

Why the chemical or surgical section of sympathetic fibers should eliminate the pain originating from the injured sensory nerves is unclear, since sympathetic nerves in the extremities are said not to contain any afferent fibers The ingenious theory of Doupe [12] postulates that, because of the demyelinization of sensory nerve fibers, cross stimulation occurs between efferent sympathetic and the poorly insulated sensory axons, resulting in pain or even efferent vasodilatation as in the causalgic state There is much to support this view, which has been discussed by us elsewhere.[18] It is a very useful working hypothesis

Another cause for pain relief is more obvious Most peripheral pain is bound to cause a reflex vasoconstriction in the same and also in other vascular areas The tennis elbow (radiohumeral bursitis), a subdeltoid calcified bursa, a ligamentous strain maintain a diffuse vasoconstriction, the pathway of which one of us (G de T ) illustrated several years ago

This same reflex operates in the case of ischemic neuritis, thrombosed arterial segments or periarterial and lymphangitic inflammatory reactions Sympathectomy abolishes this reflex and thus abolishes the pain due to vasoconstriction

Throughout this discussion we have avoided the mention of vasospasm in arteriosclerosis,[19] and it is our belief that while this is an important factor in phlebitis and thromboangiitis obliterans it plays little if any part in the symptomatology of arteriosclerosis obliterans

TABLE 4—*Effects of Lumbar Sympathectomy on the Lower Extremity*

| | |
|---|---|
| 1 | The extremity warms up faster and cools more slowly on direct exposure, reflex effects of heat and cold are ineffective |
| 2 | The high vasoconstrictor tonus in the sitting or standing position is abolished |
| 3 | Vascular exercises such as intermittent venous hyperemia are more effective |
| 4 | Any cross stimulation between sympathetic and demyelinated sensory fibers is abolished |

The excellent results obtained in this small but carefully selected series are due to the release of normal vasomotor tonus, which in turn insures an even blood flow uninfluenced by anything but the metabolic needs of the tissues [20] (table 4)

## SUMMARY

A group of 25 patients suffering from vascular sclerosis of the lower extremities were treated with lumbar sympathectomy if after preliminary block of the lumbar sympathetics the temperature of the digits rose, if walking ability improved and if generalized vascular involvement was not extensive

In one group of patients this resulted in a dramatic increase in walking ability

In another group of patients given lumbar sympathectomy amputation was averted

In a third group amputations could be performed at lower levels and in a fourth group intractable neuritic pain of the causalgic type was benefited

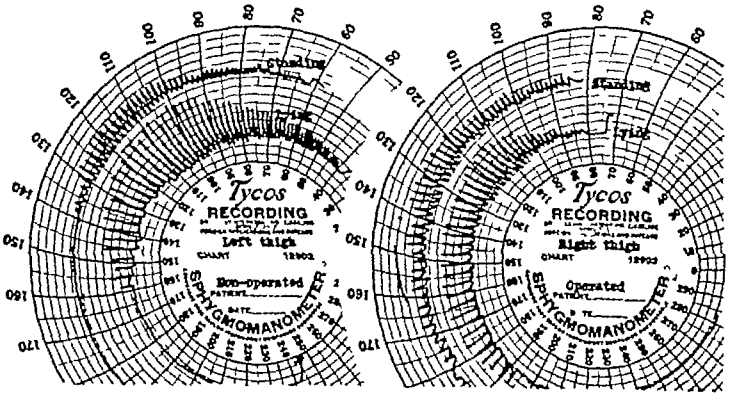

Fig 3—Oscillometric curves of a hypertensive arteriosclerotic patient whose right lower extremity has undergone sympathetic denervation Note the vasoconstriction on the left graph while standing The diastolic pressure rose from 75 to 95 mm of mercury as measured by the oscillometer On the right sympathectomized side there is no shift of the curve to higher levels the peripheral resistance has not increased and the pulse waves are only slightly decreased owing to the decreased cardiac stroke volume in the erect position. This graph indicates the elimination of postural vasoconstriction by sympathectomy

In selected cases of peripheral arteriosclerosis lumbar sympathectomy has proved to be of great value

During the bombing of England in 1940 and 1941 many crushing injuries resulted Increased interest was manifested in the characteristic urinary suppression, which became known as the "crush syndrome," that followed these injuries

James Young [1] in 1942 reported similar urinary suppression seen in two types of obstetric condition, retroplacental hemorrhage and the trauma of labor They caused massive damage to the placenta, uterine muscle and other pelvic tissue In a careful study he showed that the syndrome included the following (1) initial tissue damage, (2) shock, severe, moderate or at times absent, (3) urinary suppression leading to anuria or oliguria with urine containing casts and leukocytes, and (4) a rise in blood urea, which reached its height between the fifth and the ninth day and was followed by death or increased urinary output and recovery

We are reporting 3 cases, 1 of retroplacental hemorrhage, 1 of ruptured uterus and the third a case of twisted ovarian cyst with bloody extravasation and urinary suppression The last is a new finding which broadens the aspects of the crush syndrome to include other than obstetric hemorrhage

## REVIEW OF LITERATURE

The first recorded work in regard to urinary suppression following crushing injuries was published by Hackredt [2] in 1917 It was mentioned also in the German Army Medical Manual [3] during the first world war Minami [4] in 1923 first gave the detailed microscopy of the kidney and described the presence of casts containing blood pigment in the renal tubules (figs 2, 4 and 5) Baker and Dodds [5] in 1925 offered the explanation of obstruction of the renal tubules by blood pigment as the cause of urinary suppression

In 1941, with the increase of crushing injuries, important studies were made by Bywaters and Beall [6] and later by Bywaters and Dible [7] They demonstrated that the important renal changes are found in the collecting tubules (figs 2, 4 and 5), the glomeruli are undamaged (figs 2 and 3) The tubules contain casts, and some are plugged with granules of blood pigment and show degeneration of the epithelium, particularly in the second portion and in Henle's loop (fig 4) Since this is the site of normal urine acidification and concentration, it seems to explain the clinical phenomena found in these cases of urine that is dilute, highly acid, low in urea and high in chlorides

They concluded, therefore, that the chief changes in kidney function are the result of failure of the tubular epithelium to concentrate and reabsorb the glomerular concentrate, thus confirming the histologic findings of tubular damage without injury to the glomeruli

Three theories are offered to explain the kidney damage (1) shock followed by renal ischemia, (2) obstruction of the renal tubules by blood pigment and (3) release of toxic substances from the crushed muscle which causes the characteristic degeneration of the tubal epithelium

Young and McMichael [8] reported 2 obstetric cases of prolonged labor followed by urinary suppression and high blood urea, 1 patient recovered and the other died of anuria on the eighth postpartum day This was the first report to show the relationship of obstetric trauma to crushing injuries

Dunn and Montgomery [9] believed that shock causes stagnation or ischemia of the entire glomerular system and that there is no mechanical obstruction to the tubules, the substance within the renal tubules is nothing but debris and blood, the result of stagnation which followed the shock occurring after the original trauma They thought also that in some cases of abruptio placentae symptoms of crush syndrome developed because the kidney had been damaged previously by the preeclamptic state

Young [1] in 1942 reported an extensive study of obstetric hemorrhage and its relation to the crush syndrome He believed that neither obstruction of the kidney tubules nor shock is the cause In order to prove his point he first compared 35 cases of postpartum hemorrhage, 12 cases of placenta previa with hemorrhage and 10 cases of retroplacental hemorrhage The first two groups showed shock without blood extravasation into the uterine musculature but no renal impairment In the group with retroplacental hemorrhage 10 cases showed renal impairment

Young further analyzed 79 cases of premature separation of the placenta with albuminuric toxemia In 59 cases bleeding was of the visible or frank type, and no case showed renal impairment In 20 cases of the concealed type with blood extravasation into the uterine muscle 5 showed renal impairment of varying extent

To disprove the shock theory, Young reported 1 significant case A woman, nontoxic and at term who arose about 7 a m, voided as usual and at 8 a m was struck on the abdomen by a suddenly opened door At 3 p m severe abdominal pain developed and shortly thereafter she collapsed At 4 p m, on arrival at the hospital, she showed a typical extensive abruptio placentae and died later On catheterization only 3 ounces of almost black urine was obtained, thus indicating that the urinary suppression occurred at least seven hours before the shock from abruption Against the theory of anuria caused by mechanical obstruction of the renal tubules by blood pigment he cited an instance in which a woman died nine hours after abruptio placentae Necropsy showed renal tubules with no pigmented casts but extensive degeneration In 2 other fatalities with anuria, 1 patient had a blood urea of 173 mg per hundred cubic centimeters with typical tubular degeneration and numerous blood casts, while the other had a blood urea of 220 mg per hundred cubic centimeters, typical tubular degeneration and no blood casts

Young stated that he did not know the cause of the urinary suppression but postulated that a toxic sub

stance is formed in the traumatized muscle (skeletal or uterine) which causes degeneration of the epithelium lining the renal tubules and is the real cause of the anuria He further postulated that the debris in the tubules is coincidental and not obstructive

Eggleton, Richardson, Schild and Winton[10] conducted extensive experiments on traumatized dogs while maintaining normal blood pressure level and blood volume with infusions of plasma and saline solution In spite of this precaution, renal impairment and increased nitrogen retention developed and the dogs died with the characteristic kidney finding of the crush syndrome Diuretics were used in another series and the renal flow was actually increased, slightly lowering the mortality rate The authors believed that renal ischemia is not the cause of the crush syndrome but that Young's theory of a toxic substance released in the traumatized muscle is perhaps true

## REPORT OF CASES

CASE 1.—*Retroplacental hemorrhage, with death from urinary suppression*

Mrs M C. (fig 1), aged 29, admitted to Hahnemann Hospital Feb 1, 1943, had been pregnant for the first time in 1941, and at six months preeclampsia developed, with hypertension and albuminuria followed by premature placental separation and expulsion of a dead fetus After this pregnancy she was in good health, without evidence of hypertension

The patient again became pregnant, her last menstrual period was July 6, 1942 and her calculated date of confinement was April 16, 1943 Pregnancy was normal until about two weeks before admission to the hospital, when hypertension, albuminuria and slight general edema developed She was referred to a hospital in another city remained there about one week and then was transferred to the Hahnemann Hospital

Examination on admission showed that the patient was well nourished She weighed 61 Kg Moderate edema was present over the face, hands and feet Oral hygiene was good, the thyroid was normal to palpation and the heart and lungs appeared normal to physical examination Pregnancy had been present about twenty-eight weeks, the fetal heart beat was 152 The fetus was estimated to weigh about 900 Gm The blood pressure was 170 mm systolic and 118 mm diastolic. Examination of the optic disks showed edema of the retina, with arteriovenous ratio of 2 to 3, pulsations of the arterial vessels were present, but there was no hemorrhage or exudate. Urinalysis of a catheterized specimen showed albuminuria 1 plus with granular casts 5 to 10 per high power field and 5 to 10 leukocytes per high power field, and the hemoglobin was 13 1 Gm, red blood cells numbered 4,000,000 and white blood cells numbered 9,800 The Wassermann and Kahn reactions were negative. The blood type was O There was no nitrogen retention, the nonprotein nitrogen was 22 mg per hundred cubic centimeters and uric acid was 5 mg per hundred cubic centimeters The provisional diagnosis was preeclampsia, probably with previous arterial damage The classic signs of hypertension, albuminuria and edema were present The Rh factor was not determined.

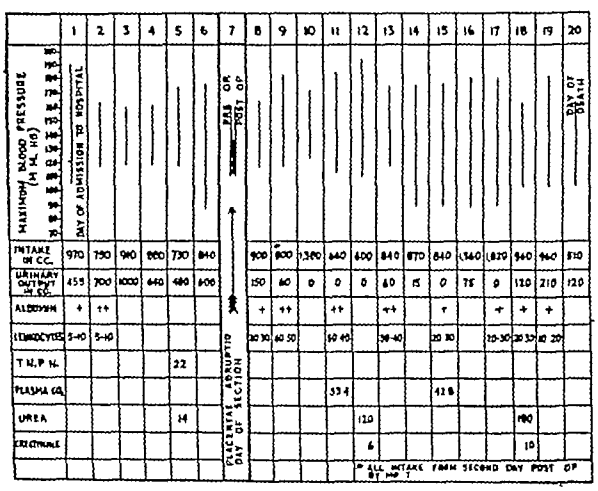

Fig 1 (case 1).—Abruptio placentae with retroplacental hemorrhage showing urinary suppression leukocytes in urine and elevation of blood urea and creatinine with fatal termination

Six days after admission premature separation of the placenta, concealed type, developed suddenly, with slight external bleeding and absent fetal heart sounds A low, classic cesarean section was performed promptly under cyclopropane-oxygen anesthesia and a transfusion of 500 cc. of citrated blood was given At operation a retroplacental hematoma of about 250 cc. was found, with considerable infiltration of blood into the uterine wall.

Fig 2 (case 1).—Section of kidney showing obstructed tubules and normal glomeruli Stained with hematoxylin and eosin slightly reduced from a photomicrograph with a magnification of 80 diameters

Fig 3 (case 1).—Section of kidney showing normal glomeruli Stained with hematoxylin and eosin slightly reduced from a photomicrograph with a magnification of 350 diameters

Dr. Joseph Field Library
53 P. C. P. Medical College

The baby, a premature infant of about thirty weeks, was stillborn. There was no evidence of shock.

From the time of the placental separation urinary suppression developed, the urinary output was 150 cc. on the first postoperative day, 60 cc. the second day and then none at all. The anuria persisted, with increasing edema and anemia. On the

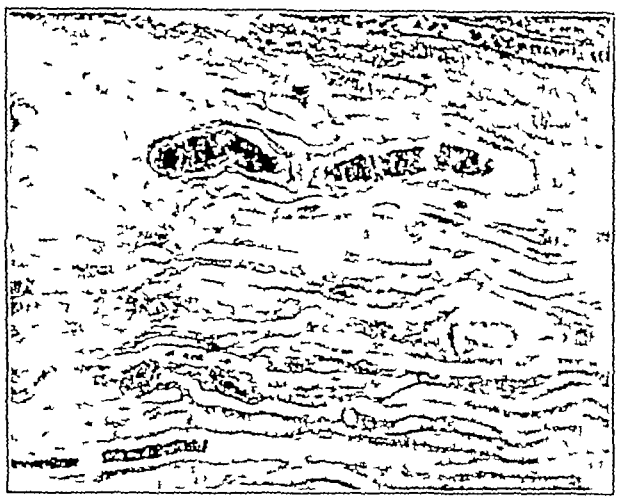

Fig. 4 (case 1).—Section of kidney showing characteristic obstruction of the collecting tubules by blood cells and débris. Stained with hematoxylin and eosin, slightly reduced from a photomicrograph with a magnification of 80 diameters.

second postoperative day a consultation was held with Dr. Garth Boericke of the medical staff, who drew attention to Young's[1] report of crush syndrome in cases of abruptio placentae and its similarity with this case.

The treatment during this period consisted in four transfusions of citrated blood, 500 cc. each, hypertonic glucose 50 cc. of a 50 per cent solution intravenously, Fisher's solution by rectal drip, two doses of 1,000 cc. each of potassium citrate and sodium bicarbonate by mouth. Urinalysis showed persistent albuminuria 1 plus without casts but with leukocytes and occasional erythrocytes. Increasing nitrogen retention was evident, the blood urea concentration was 180 mg. per hundred cubic centimeters and creatinine 10 mg. per hundred cubic centimeters on the tenth day after operation. On the eleventh postoperative day the patient voided 210 cc. of urine and began to show signs of improvement, but on the twelfth day she died suddenly with acute dyspnea.

Abstract of the autopsy findings was as follows: Generalized edema of the body tissues and serous cavities, including edema of lungs, bilateral hydrothorax, hydropericardium and hydroperitoneum. The characteristic liver findings of eclampsia were present, including widespread focal hemorrhagic necrosis. These areas of necrosis were not of recent occurrence but had been present several weeks as shown by the reactive fibrosis around them. The kidneys were swollen and firm, weighing 285 and 290 Gm. respectively, and the cortex contained numerous punctate hemorrhages on section. Microscopic examination (figs. 2, 3 and 4) showed no glomerular damage but degeneration of the tubules with many hyaline and pigmented casts. Staining with prussian blue (fig. 5) demonstrated that the pigment was iron, confirming the hemorrhagic nature of the tubular casts.

CASE 2.—*Rupture of the uterus with extensive hemorrhage, with recovery.*

Mrs. R. B. (fig. 6), aged 25, a quadrigravida, was admitted to Broad Street Hospital on Aug. 2, 1942 at term, shortly after the membranes had ruptured. The baby was in breech presentation, right sacroanterior. Labor proceeded unsatisfactorily owing to primary inertia and considerable restlessness on the part of the patient. On the evening of August 3, twenty-nine hours after the onset of labor, she was seen in consultation by one of us, who found the cervix dilated only 2 cm. Sedation and rest were advised. She was given morphine 0.0016 Gm. (1/4 grain) and scopolamine 0.1 mg. (1/150 grain), which produced excellent rest that night.

Eleven hours later labor started again and proceeded with fair pains for three hours, when she was given pitocin 0.15 cc. (2 minims) by hypodermic. This was followed by pains of increased severity, vaginal bleeding, rapid pulse (110) and drop in blood pressure to 90 mm. systolic and 60 mm. diastolic. A vaginal examination at this time showed considerable bleeding, the cervix was fully dilated. The consultant was called a second time. The patient was in moderate shock. She was anesthetized with open drop ether and a dead baby was delivered with little difficulty by prompt breech extraction. During delivery she received 1 unit (250 cc.) of blood plasma and an infusion of 5 per cent glucose in saline solution. Immediately following delivery the placenta was delivered manually and the uterine cavity explored for evidence of ruptured uterus.

A large tear was found, 15 cm. long, extending from the external os on the right up into the fundus. The uterus was quickly packed and the patient taken to the operating room, where a supravaginal hysterectomy was performed while a transfusion of 500 cc. of citrated blood was given.

When the abdomen was opened the uterine tear was found to extend out the right broad ligament to the external iliac artery. There was approximately 300 cc. of free blood in the peritoneal cavity and a great area of extravasation throughout the broad ligament. After hysterectomy, 9 Gm. of sulfanilamide was placed on the cervical stump and the patient was returned to bed in serious shock. She received a second transfusion and 1 500 cc. of 5 per cent glucose in saline solution by infusion.

Convalescence was stormy. Urinary suppression developed immediately, so that no urine was voided for the first twelve hours after operation. The next day the output was 105 cc., the second postoperative day 315 cc. the third day 900 cc. At this time the patient showed nitrogen retention with blood urea of 31.5 mg. per hundred cubic centimeters. The blood pressure rose to 120 mm. systolic and 68 mm. diastolic. The next day the urinary output rose to 1,830 cc. and the blood pressure to 136 mm. systolic and 70 mm. diastolic, but on the sixth day distinct improvement appeared. The blood urea was 14 mg. per hundred cubic centimeters, the blood pressure 130 mm. systolic and 80 mm. diastolic. At this time a vesicovaginal fistula developed and the urinary output could not be measured, but there was no further sign of urinary suppression. Convalescence continued to be stormy, complicated by sepsis, infec-

Fig. 5 (case 1).—Section of kidney showing characteristic obstruction of collecting tubule by blood cells and débris. Stained with prussian blue to show presence of iron thus proving that the obstructing debris contains blood pigment, slightly reduced from a photomicrograph with a magnification of 350 diameters.

tion of the urinary tract and later, secondary bleeding from the fistula.

In all, the patient received seven transfusions of citrated blood of which five were given during the first three postoperative days. Aminophylline 0.2 Gm. one dose on the third day, and sulfadiazine for five days beginning on the sixth

postoperative day, were administered The patient was discharged on the forty-second day after operation in fairly good condition except for moderate secondary anemia and the vesicovaginal fistula, which was still present

One year later the patient returned to the hospital and the fistula was closed by vaginal operation At that time she was in excellent condition A later test showed her to be Rh positive

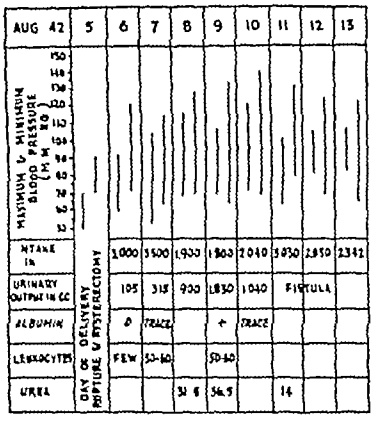

Fig 6 (case 2) —Rupture of uterus with extensive bloody extravasation showing urinary suppression leukocytes in urine and elevation of blood urea followed by recovery Antepartum blood pressure was normal.

CASE 3—*Twisted ovarian cyst, with urinary suppression*

Miss R Z, white aged 22, who was admitted to St. Luke's and Children's Medical Center on Aug 8, 1943, gave an essentially negative past history The menstrual periods were regular and normal The last menstrual period was August 1 to 6 inclusive

On August 3, the third day of her menstrual period, she suddenly was seized with sharp abdominal pain, vomiting and later fever The pain was most intense in the upper left quadrant *Immediately total urinary suppression appeared,* which continued during the four days she remained at home There were no signs of shock at any time. She was sent to the hospital with a diagnosis of left renal calculus producing ureteral obstruction and reflex anuria of the opposite kidney

On admission to the genitourinary service the patient's temperature was 100 F, pulse rate 100 and respiratory rate 24 She appeared to be acutely ill and in pain Examination of the abdomen revealed generalized tenderness and rebound pain No peristalsis was heard. There was resistance to palpation in the left upper quadrant of the abdomen Blood examination revealed hemoglobin 11 1 Gm, red blood cells 4,130,000 and white blood cells 15,800 Sedimentation rate was 38 mm per hour, blood sugar 128 mg per hundred cubic centimeters, urea nitrogen 14 0 mg per hundred cubic centimeters and creatinine 1 0 mg per hundred cubic centimeters The Wassermann and Kahn reactions were negative The blood Rh was positive. Cystoscopy revealed that the bladder mucosa was normal A number 5 catheter was passed into the left renal pelvis without meeting any obstruction, and 120 cc. of brownish red, cloudy urine was removed from the bladder This contained a cloud of albumin and numerous red blood cells One cc. of urine was obtained from the left renal pelvis Pelvic examination revealed that the external genitalia and perineum were normal Although the bimanual examination was unsatisfactory because of pain and abdominal distention, the uterus was found to be small and freely movable and the cervix normal There was no evidence of fluid in the posterior cul-de-sac. Both adnexal regions were tender, and no masses were palpable

The patient was treated conservatively with intravenous fluids oral Wangensteen suction and sedation. In the first twenty-four hours after admission only 60 cc of blood-tinged urine was obtained Thirty-six hours after admission 480 cc. of urine was obtained Following this the urinary output returned to normal Roentgenographic examination of the colon on August 13, with contrast enema showed no structural or pathologic changes within the colon and no displacement of the colon There was a shadow of a large tumefaction on the left side which reached as high as the transverse process of the first lumbar vertebra This shadow appeared to arise from below upward and suggested a cyst or other pelvic tumor

The patient's general condition *improved For the first five* days after admission the temperature fluctuated between 98.2 and 102.2 F and gradually subsided to a range between 98.2 and 100 F On August 29, or the twentieth day after admission, laparotomy was performed A large left ovarian cyst was found, twisted on its pedicle three times, with hemorrhagic infiltration into the cyst wall (fig 7) and hemorrhage into the cyst cavity The omentum and intestines were adherent to it. The pedicle was ligated and the cyst removed Pathologic examination showed a nonpapillary serous cystadenoma with early gangrene, blood infiltration of the wall and bleeding into the cyst.

## COMMENT

In a consideration of the relationship of our cases to the studies of previous investigators, Young's[1] theory seems to offer the best explanation of the mechanism of the urinary suppression

The one common factor in all 3 cases was extravasation and infiltration of blood into body tissue That the tissue does not have to be muscle tissue is shown by the case of twisted ovarian cyst in which the bloody infiltration occurred only in the cyst wall and cavity It is possible that the infiltration of blood into any type of cellular tissue may release toxic substances, causing the typical kidney reaction, and thus the syndrome may be found in other hemorrhagic conditions Extensive bloody infiltration seems to be a more important factor than shock in 2 of our cases, the patient with the twisted ovarian cyst and the one with placental separation showed little or no evidence of shock The role played by the Rh factor in this condition is unknown *In these cases it did not seem to be a factor* The 2 patients who survived were Rh positive The factor was undetermined in the fatal case It seems logical that the Rh factor should have no effect on the prognosis except in cases in which multiple transfusions are necessary

It is possible that the underlying toxemia, with its antepartum renal damage, was a contributory factor in the fatal termination of the case of placental separation It is important to note, however, that in this case the areas of hemorrhagic liver necrosis were not extensive and that regeneration had started before death occurred

Fig 7 (case 3) —Section of *ovarian cyst wall showing* infiltration of red cells and leukocytes Stained with hematoxylin and eosin slightly reduced from a photomicrograph with a magnification of 80 diameters

The ruptured uterus is an excellent example of birth trauma as a cause of urinary suppression, and it is likely that *other cases of dystocia* and extensive surgical procedure will show crush syndrome if the physician is on the alert for its signs

SUMMARY

Three cases of crush syndrome with urinary suppression were all of different origin 1 case of placental separation with retroplacental hematoma, 1 case of ruptured uterus and a third case of hemorrhagic twisted ovarian cyst

The 3 cases have in common the one factor of extensive hemorrhagic infiltration into body tissue Two patients showed little or no evidence of shock and 1 severe shock, although this patient recovered Apparently shock is not the important causative factor Young's [1] theory of release of unknown toxic substances seems to offer a better explanation

Urinary suppression may follow dystocia and birth trauma more often than is ordinarily suspected and may explain some hitherto obscure obstetric fatalities

The same syndrome may be present in other cases of twisted ovarian cysts and is worthy of further study

## A CLINICAL SYNDROME FOLLOWING EXPOSURE TO ATOMIC BOMB EXPLOSIONS

COLONEL PAUL D KELLER
Medical Corps Army of the United States

The information presented in this report was obtained from studies on 21 patients who were admitted to the Osaka University Hospital in late August and early September 1945 suffering from an alarming malady designated atomic bomb disease by the Japanese I observed, examined and followed approximately half of the patients, while information on the remaining patients was taken from the hospital records The patients selected for presentation do not include those receiving severe blast injuries or extensive external burns at the time of the explosion Included are patients who received minor or no injuries or burns during those catastrophic days at Hiroshima and Nagasaki but who subsequently developed severe clinical manifestations, which in 5 instances resulted in death Seventeen of the patients herein presented experienced the atomic bombing at Hiroshima, Japan, on August 6, 1945, while the remaining 4 were victims of the Nagasaki explosion on Aug 9, 1945 The average age incidence is 30, with extremes of 20 and 52 Three are women, while the other 18 are men It is to be remembered that these people were not hospitalized until on an average of one month after their atomic bomb experience The average day of death for the 5 fatal cases was twenty-six days after the bombing Those who survived required long periods of hospitalization before their recovery was sufficient to warrant a hospital discharge

### CLINICAL HISTORY

The environmental location of each victim at the time the atomic bomb exploded and their relationship to the center of the explosion is especially interesting The variation in distance among cases ranged from 50 to 4,000 meters Seventeen of 21 patients were in buildings at the time the bomb exploded Fourteen of these 17 patients were in wooden buildings, while the other 2 were in concrete buildings Table 1 summarizes the variations in distance and the location of victims in reference to the type of building or other location

Only 5 patients recalled experiencing a definite concussion wave at the time of the atomic bomb explosion One of the 5 who was in a wooden building about 50 meters from the center of the explosion was thrown 12 feet by the blast as the building collapsed The

TABLE 1—*Location of Victims*

| Distance in Meters | Number of Patients | Patients in Wooden Buildings | Patients in Concrete Buildings | Patients Outdoors | Location Unknown |
|---|---|---|---|---|---|
| 0 to 50 | 4 | 4 | 0 | 0 | |
| 200 to 300 | 3 | 1 | 1 | 0 | 1 |
| 500 | 4 | 3 | 1 | 0 | |
| 1 200 | 1 | 1 | 0 | 0 | |
| 1,500 | 1 | 1 | 0 | 0 | |
| 2 000 | 2 | 2 | 0 | 0 | |
| 4 000 | 1 | 1 | 0 | 0 | |
| Unknown | 5 | 1 | 1 | 2 | 1 |
| Total | 21 | 14 | 3 | 2 | 2 |

2 victims who were outdoors had contrasting experience in that 1 was knocked unconscious while the other 1 felt no blast

Three patients recall hearing a noise "like the sound of an explosion" One described a noise that sounded "like a falling bomb," and 2 said the noise they heard at the time of the atomic bomb explosion was a sound "like rain" Two stated that they heard no definite sound of an explosion, while the remaining 13 were uncertain

Nine patients were conscious of a "flash of light" when the bomb exploded One of the 9 described the light as being green Three of the remaining 12

TABLE 2—*Onset of Symptoms*

| Case No | Anorexia | Onset in Days After Bombing | Nausea | Onset in Days After Bombing | Vomiting | Onset in Days After Bombing |

| 20 | Present | First day | Present | First day | Present | Second day |
| 21 | Present | First day | None | | None | |

patients experienced no sensation of light, while the other 9 case records do not specify one way or the other

All patients but 4 incurred minor wounds (13 patients) or burns (4 patients) at the time of the explosion These wounds resulted from flying splinters, glass and other debris or resulted from falls by the patients, and were in the form of abrasions, contu-

sions and lacerations With 2 exceptions these lesions were healed prior to the time the patient applied for admission to Osaka University Hospital

Anorexia, nausea and vomiting of varying severity and length of duration were a common early symptom The onset of these symptoms occurred within the first five days after the explosion Data relative to these symptoms is presented in table 2

Twelve patients gave a history of having a fever or feeling feverish prior to the time they were admitted to the hospital Four patients did not know and a single patient stated that he had not experienced a rise of temperature before his admission to the hospital No data in reference to fever were available on 3 patients The onset of the fever ranged from two to twenty-five days after the explosion The intensity of the fever varied from slight to high

Unusual and in several instances considerable loss of hair from the scalp was experienced by 13 of 21 patients One person definitely did not lose unusual amounts of hair during the course of his illness The records on the remaining patients do not contain information relative to the loss of hair The onset of epilation varied from seven days to twenty-one after exposure to the atomic bomb explosion, with an average date of onset of eighteen A few persons noted swelling of the hair roots a day or two before they noticed the beginning of hair loss None of the twenty-one patients noticed unusual loss of hair from the axillas or pubis, but 1 had loss of hair from the eyebrows and another from the beard

Nine patients exhibited hemorrhagic manifestations prior to their admission to the hospital All 9 noticed this occurrence shortly before admission on an average of twenty-five days after the bombing In 2 it occurred after admission to the hospital Thus a total of 11 patients displayed unusual hemorrhagic tendencies during the course of their illness Bleeding gums was the most common manifestation (6 cases), subcutaneous bleeding next (3 cases), nose bleed and tonsillar bleeding last

Fatigability was almost a universal complaint, which was mild as a rule following the bombing but increased in severity to become actual weakness in most patients by the time they were admitted to the hospital

Two patients developed diarrhea, 1 on the fourth day after the bombing and the other on the ninth day This disturbance was transient in both The other patients showed no significant change in bowel habit

Other symptoms complained of by single patients were faintness, tightness in the chest dizziness, difficulty in swallowing and unusual thirst

### RESULTS OF PHYSICAL EXAMINATION

Fever and a corresponding rise in the pulse rate are the most common and prominent findings on physical examination Ten patients had an elevated temperature at the time of admission and all the remaining patients manifested elevations in temperature during their period of hospitalization The temperature ranged between 37 and 40 C (98 6 to 104 F ) with occasional recordings slightly above 40

Hemorrhagic manifestations were found on admission or developed soon thereafter in the form of bleeding gums, petechiae, ecchymoses and nosebleed in 12 of these cases Four of the 5 fatal cases exhibited purpuric tendencies

Epilation of the scalp was detectable in 13 victims The loss of hair was diffuse In a few cases it was almost complete, while in other cases it was hardly detectable yet definitely abnormal

Unilateral slight enlargement of the cervical lymph nodes was palpable on 4 patients, of whom 3 had tender nodes

Areas of edema involving the lips, face and eyelids were noted on 2 patients at the time of their admission to the hospital

One patient who died presented jaundice terminally, while a second patient who recovered displayed a mild transient icterus

Varying degrees of pallor was a physical finding in a small percentage of the cases

Physical examination aside from fever, increased pulse and respiratory rates, purpuric tendencies, epilation, localized edema, cervical lymphadenopathy, jaundice and pallor was negative, including neurologic findings

### LABORATORY DATA

The laboratory studies that were done on these patients revealed evidence of profound pathologic changes. Abnormal white blood cell and white differential counts, red blood cell counts, hemoglobin determinations, sedimentation rates, amounts of plasma proteins and unusual bleeding times were consistently found. Significant abnormal changes in the urine also were observed.

Dramatically low leukocyte counts with pronounced granulocytopenia and in many cases a resultant relative lymphocytosis were the most spectacular findings. All cases reported showed the leukopenia, while in the few cases in which thrombocyte counts were made they were found to be low. Very low percentages of the granulocytic series of cells was found on 2 of the 5 patients who had sternal punctures and sternal marrow studies. Hypochromic microcytic and hypochromic normocytic anemia was a common but not constant laboratory finding. Table 3 gives most of the hematologic data on these Japanese bomb victims.

### SEDIMENTATION RATES

The Westergren method for the determination of the sedimentation rate of red blood cells showed that the rate was exceedingly rapid both at one and two hour intervals. This determination is considered of great diagnostic and also prognostic importance in this malady. Table 4 gives the available data on sedimentation rates.

### MISCELLANEOUS LABORATORY EXAMINATIONS

Bleeding times were determined on 9 patients and found to be abnormally prolonged in all 9. The average bleeding time by the Duke method was thirteen minutes. The clotting time, however, on the same 9 patients was within normal limits, averaging slightly more than three minutes. The direct van den Bergh test on the 7 blood samples from 7 separate patients was negative, while the indirect van den Bergh was positive on 6 of the same 7 patients. Studies on the fragility of the red blood cells of 8 patients showed no deviation from the normal.

Urinalysis on most patients disclosed positive findings of small amounts of albumin, with positive evidences of tyrosin in the urine of 3 patients. Abnormal amounts of urobilinogen in the urine were found in 9 of 11 patients. Urinalysis otherwise was negative.

Total protein determinations were done on a few patients after they had been in the hospital for a while, and in all there was a profound decrease in the total proteins, especially albumin, with a resultant reversal of the albumin-globulin ratio.

### SUMMARY AND CONCLUSIONS

Twenty-one patients who developed a delayed illness following their exposure to atomic bomb explosions in Japan were studied. The data on these few patients seem to indicate that the possibilities of developing this syndrome is not significantly affected by distance from the center of the explosion as long as one is within a 2,000 meter radius. It is undoubtedly significant that only 1 patient is known to have been outdoors when the explosion occurred, and therefore people inside buildings were more apt to suffer from the delayed effects of atomic bombs provided they survived the initial effects. The delayed malady to some degree results from a generalized disturbance in human physiologic function, but the effects can be attributed principally to destruction or suppression of elements of the hemopoietic system (mainly granulocytes and thrombocytes) and to disturbance in liver function. The former effect produces a leukopenia (principally a granulocytopenia), thrombocytopenia, increased bleeding time and hemorrhagic tendencies with a resulting anemia, fever and weakness. The latter effect on the liver produces an albuminuria, tyrosinuria, hypoproteinemia, positive indirect van den Bergh reaction, jaundice and fever. The rapid sedimentation rate of erythrocytes gives evidence of extensive tissue destruction within the body. The similarity of this illness to that following excessive irradiation of the body with x-rays is striking.

**Modern Research.**—The possibilities of research by simple means have largely disappeared. Expensive apparatus, great amounts of expendable material and proper assistance—secretarial and technical—are essential in modern research. What generous financial support does for an investigator is to increase and accelerate his output. If he has ample money to aid him he is not compelled to spend time in a shop making necessary apparatus but can order it made by skilful machinists, he is not required to undertake the labor of rearing and attending to animals for his studies but can buy the animals from reliable dealers or hire some one to breed them and give them proper care, he need not make charts, graphs and tables or prepare tracings and records for publication but can employ a draftsman to attend to these matters. Just so far as an investigator is freed from distracting attention to a variety of minor tasks which, though essential, are better performed by expert technicians in the several fields is he enabled to devote himself to his own special functions—keeping in touch with the moving frontier of knowledge, the newest literature, the latest discoveries, estimating the significance of fresh achievements in other places as related to his own current studies, and, by conferences with his fellow workers and by personal engagement in experiments, participating in the advances into new territory.—Cannon, Walter B. The Way of an Investigator, New York, W. W. Norton & Co., Inc., 1945.

# TYPHOID AND PARATYPHOID A IN IMMUNIZED MILITARY PERSONNEL

LIEUTENANT JEROME T SYVERTON
COMMANDER RICHARD E CHING
LIEUTENANT COMMANDER F S CHEEVER
Medical Corps, United States Naval Reserve
and
LIEUTENANT (jg) ANCIL B SMITH
Hospital Corps, United States Navy

A clinical picture strongly suggestive of typhoid in a patient hospitalized because of suspected typhus led to bacteriologic and serologic studies that established the illness as paratyphoid A This patient had become ill within four days of his arrival on Guam from Okinawa When further inquiry revealed that other marines and soldiers, recently evacuated from Okinawa, were in four hospitals on Guam because of similar clinical findings, the obvious importance of learning whether these patients had typhoid or paratyphoid led us to undertake an investigation of this problem Bacteriologic and serologic studies established typhoid or paratyphoid A as the diagnosis for 24 cases Of these, 21 were paratyphoid A and 3 were typhoid

It is our purpose in this paper to present certain clinical, bacteriologic, immunologic and epidemiologic data that relate to these 24 proved cases of typhoid or paratyphoid A in immunized military personnel [1]

## DATA RELATING TO THE PATIENTS

Of the 24 proved cases of typhoid or paratyphoid A, 16 were in marines and 8 were in soldiers All 24 patients had been overseas for at least six months prior to the onset of illness, and all but 1, a marine, had been evacuated recently from Okinawa, a combat area One explanation for the higher incidence in marines is that three of the four hospitals utilized on Guam to care for these patients were naval hospitals

The age distribution in years was from 18 to 37 Eighteen patients were between 20 and 30 years of age, 4 were under 20 and 2 over 30 Twenty-three of the patients were white Americans and 1 patient (case 10) was an American Negro

As these 24 patients were military personnel on duty in a forward area, there was little possibility that all indicated measures for immunization had not been effected It seemed worth while nevertheless, to check the most recent date of typhoid-paratyphoid immunization Accordingly, the health records of 20 of the 24 patients were reviewed, the records of the other 4 were not available The data on typhoid-paratyphoid immunization for the 20 men are presented in table 1 Nineteen of the 20 patients had received the full standard course of vaccination One patient had on record only a single initial dose of 0 5 cc, but he had received a booster dose recently Fifteen of the 20 men had been given one or more booster injections The interval in months between the last dose of vaccine and the onset of illness is given for each case in table 2 This interval ranged from five to fifteen months As the accepted expectancy for duration of immunity approximates twelve months, each of the 20 patients should have had some residual immunity at the onset of his illness The possible influence exerted by this residual immunity on the patient's clinical course will be considered

## BACTERIOLOGIC STUDIES

Repeated attempts were made to recover the causative organism from each patient by culture of blood, stool and urine Additional material for culture from 1 patient consisted of bone fragments removed from periostitic foci

The technic of blood culture was modified from that routinely employed This modification was effected because these patients, as members of the armed forces, presumably had received prophylactic inoculations of triple typhoid vaccine and therefore should react to infection with an immediate, specific, anamnestic response. It was assumed, therefore, that this early heightened response would result in humoral anti-

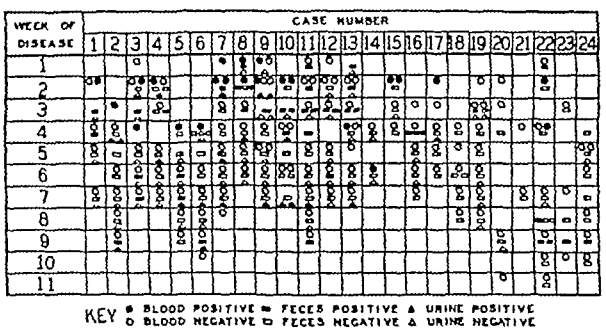

Chart 1.—Micro-organisms isolated by culture of blood, feces and urine

bodies in sufficient quantity to make cultivation of the organism difficult. Accordingly from 10 to 20 cc of whole blood was withdrawn and allowed to clot, the serum was saved for serologic study, and only the clot was used for culture. Each clot was divided into three portions for transfer to each of three tubes of medium, two of tryptose-phosphate broth containing 0 1 per cent agar and one of thioglycollate medium containing 0 1 per cent agar The cultures were incubated at 37 C. for seven days or until growth was found by daily examination to be present.

Source material for fecal cultures was obtained by the rectal swab technic or from whole fecal specimens This material was used for transfer to a Bacto-Shigella-Salmonella agar plate, which was inoculated comparatively heavily by means of a loop or cotton swab Urine for culture was obtained by having the patient void into a sterile test tube (25 by 150 mm.) Five cc. of urine then was added to an equal amount of tryptose-phosphate broth, *ph* 7.2, for incubation at 37 C for from eighteen to twenty-four hours When growth became apparent, a Bacto-Shigella-Salmonella agar plate was heavily inoculated by transfer of two or three loopfuls of the broth culture. After incubation at 37 C for from eighteen to twenty-four hours the plates were inspected for colorless colonies When such colonies were present, four to six were selected for transfer by streaking to separate MacConkey agar plates This step was to determine the homogeneity of a colony When, after incubation at 37 C for from eighteen to twenty-four hours the resultant colonies were found to be "pure," transfer to agar slants with incubation at 37 C. for twenty-four hours was carried out Then the growth on the slant was used as the source culture for determining the bio-

Hess CPhM and G H Vogt CPhM

chemical reaction of the organism The carbohydrates used in fermentative tests were glucose, lactose, sucrose, mannitol, dulcitol and maltose Incubation at 37 C for thirty days was carried out in all fermentative tests Growth in peptone medium was employed for tests to determine the production of hydrogen sulfide and indole Motility was determined by inoculating semisolid medium (the semisolid medium utilized in this laboratory is a modification of that of Jordan, Caldwell and Reiter, as described by Edwards and Bruner [2]) Incubation was carried out at 37 C for several days or until motility was apparent

Species identification within the various genera was carried out by agglutination tests in which specific typing serums were used The antigenic analysis of the Salmonella strains isolated was accomplished by means of the standard Salmonella typing serums prepared by Dr P R Edwards of the Department of Animal Pathology, Kentucky Agricultural Experiment Station, University of Kentucky, for the National Research Council

A specific diagnosis was established for 24 patients [3] with the clinical picture and physical findings of typhoid or paratyphoid A The bacteriologic findings are summarized in chart 1 Success or failure of isolation of the causative organism is indicated according to the week of the disease It can be seen that the etiologic agent was isolated from 19 patients, from the blood and feces of 8 patients, from the blood of 7, from the feces of 3 and from bone fragments of 1 This last case gave a history entirely compatible with typhoid complicated with periostitis of both tibias The diagnosis in each of the remaining 5 cases was made by serologic tests

## SEROLOGIC STUDIES

As far as possible, weekly samples of serum were obtained from each patient for the determination of the antibody titer against Salmonella typhosa, Salmonella paratyphi A Salmonella paratyphi B, Proteus $OX_{19}$ and Proteus $OX_k$ The macroscopic (tube) agglutination test was used Since standardized issue antigens were not available, we prepared our own In the case of the Salmonella organisms several strains of each species and various methods of preparation were tried in an attempt to produce antigens of maximal agglutinability Unfortunately, standardized "high titer" antiserums were not available for testing them

The results of the Widal tests are given in table 3 Each patient's immunologic response undoubtedly was altered by the residual relative immunity present at the onset of his disease Moreover, the picture is incomplete in some cases because serum specimens withdrawn early in the illness were not available or because the agglutinative tests were carried out in other laboratories

In the 3 cases of typhoid (in 2 of which the diagnosis was established by the isolation of S typhosa) the Widal reactions were quite typical In 21 cases of paratyphoid A the Widal reactions were diagnostic in 12 (S paratyphi A was recovered from either the

blood or the stool or both of 5) In the remaining 9 cases the agglutination tests were atypical and the diagnosis was established by the isolation of S paratyphi A from the blood or stool or both in each case Thus, had the laboratory diagnosis been based on serologic results alone nearly half the cases of paratyphoid A would have been missed

In these 9 cases the agglutinin titers against the homologous H and O antigens were not significantly higher than those against at least one of the corresponding heterologous ones In several instances they were actually lower In 3 of these cases the highest agglutinin titer recorded against either homologous antigen (H or O) was 1 40, and in a fourth case it was 1 80 None of these cases showed the typical anamnestic reaction one would expect in a person who had been immunized against the disease relatively recently As in the other cases of the series the H agglutinin titers were usually higher than for the corresponding O

Agglutination tests were set up against Proteus $OX_{19}$ and $OX_k$ but in no case were these organisms agglutinated to a significant titer

## CLINICAL PICTURE AND COURSE

Even though the clinical and pathologic manifestations of typhoid or paratyphoid A are sufficiently protean to make difficult a comparison of the disease in vaccinated and nonvaccinated human hosts, the size and homogeneity of the group of cases under study make worth while a description of our findings It was expected that the relative immunity present in each host as the result of artificial active immunization would alter measurably the clinical picture as observed for the group

Typhoid and paratyphoid A may closely simulate each other More commonly, however, the clinical and pathologic manifestations in paratyphoid A are neither as severe nor of as long duration as in typhoid Unlike S paratyphi B, S paratyphi A rarely causes the type of infection classified clinically as 'food infection" or "food poisoning," In the present series of cases there was little to distinguish the cases of typhoid and paratyphoid A on clinical grounds alone

## INCUBATION PERIOD

The incubation period of typhoid or paratyphoid A is variable, ranging from five to forty days, but more usually it is from ten to fourteen days In the present series of cases, departure of the patient from Okinawa presumably cut off any further contact with the infectious agent It would seem, therefore, that an indication of the probable incubation period of typhoid or paratyphoid A in vaccinated persons could be gained by learning the interval in days between arrival on Guam and onset of disease Inquiry, however, revealed that the date of onset of disease varied from twenty-nine days after arrival on Guam to forty-one days before leaving Okinawa for patients who were evacuated because of their illness As these 24 patients were brought from Okinawa to Guam in sixteen different carriers (eight ships and eight planes) there is little possibility that the transport or conditions en route were factors

## CLINICAL FINDINGS AT ONSET

The onset of illness was fixed as the day of appearance of fever, although indefinite prodromal symptoms had been present in some cases The onset of illness in 23 of the 24 patients took place prior to admission to the hospital These data are presented in table 4 The number of days of illness before admission ranged from 0 to 21 and averaged 5 6 The onset of illness in 11 was abrupt, in 13 it was gradual Table 5 summarizes their presenting symptoms It will be noted that their symptoms were in common with those that occur in many acute febrile infectious diseases In 4 of the cases with gradual onset, chills occurred within from one to four days after admission to the hospital to initiate severe clinical symptoms essentially similar to those observed in the cases with abrupt onset

Abdominal pain and diarrhea at onset were indefinite in nature The liquid stools in no instance contained blood or excessive mucus It is of interest that 9 patients [4] (37 per cent) had diarrhea of variable severity within twenty-one days prior to the onset of their acute illness Since, however, diarrhea was common among combat troops on Okinawa and the diarrhea of the patients under study was not sufficiently outstanding in character or severity for the patient to be selected during that twenty-one day period for special studies the relationship of the preceding diarrhea to the specific disease subsequently proved to be typhoid or paratyphoid A could not be determined That more than infection by Salmonella may have been present was shown when attempts to recover intestinal pathogens from feces resulted in the isolation of dysentery bacilli from 2 patients Patient 8 yielded Shigella ceylonensis and patient 5 Shigella flexneri IX In addition, a third patient (16) with proved paratyphoid A, one who had diarrhea and severe right upper quadrant abdominal pain on admission, yielded on sigmoidoscopy vegetative forms of Endameba histolytica. Obviously these findings made it difficult to interpret the significance of diarrhea, whether preceding or accompanying the patient's illness

Headache was complained of by 14 patients at the time of admission and is discussed in detail with the other central nervous system manifestations

Generalized aching is recorded as being present at onset for only 4 patients It is probable that this figure is not correct for specific complaints such as headache, weakness, chills and diarrhea undoubtedly dominated the picture in many cases, and particularly in those with sudden onset

TABLE 4—*Duration of Symptoms Before Hospitalization*

| Average number of days from onset of illness until patient was hospitalized (for 24 cases of typhoid or paratyphoid A) | 6.5 | | | | | | | | | | | | | | | | | | | | | | | |

[4] Cases referred to in the text are indicated by number It is to be kept in mind that a diagnosis of paratyphoid A was established for cases 1 through 21 and a diagnosis of typhoid for cases 22 through 24

That the presenting symptoms did not tend to limit the diagnosis to a single disease is apparent from the wide variety of admission diagnoses, as shown in table 6

CLINICAL DISEASE

Study of the symptoms and signs that occurred during the course of each patient's illness gives a composite picture of typhoid or paratyphoid A as it affects

TABLE 6.—*Admission Diagnoses*

| Disease | Number of Patients |
|---|---|

| Appendicitis acute | 1 |
| Dysentery, type undetermined | 1 |

immunized personnel The manifestations for each of 24 patients are presented in table 7 It will be noted that the findings for each case are consistent with those of typhoid or paratyphoid A in a nonvaccinated population However, the signs and symptoms of illness in the present series of cases were, perhaps, less severe and more variable than those that occur in the natural disease Individual cases ranged from a mild febrile illness of a few days duration to a severe toxic and debilitating malady that resulted in fever for as many as sixty-four consecutive days and required hospitalization for eighty-eight days before evacuation could be effected

Table 8 shows the number of days of hospitalization required by each patient, and table 9 shows the disposition of each patient on his discharge from the hospital on Guam

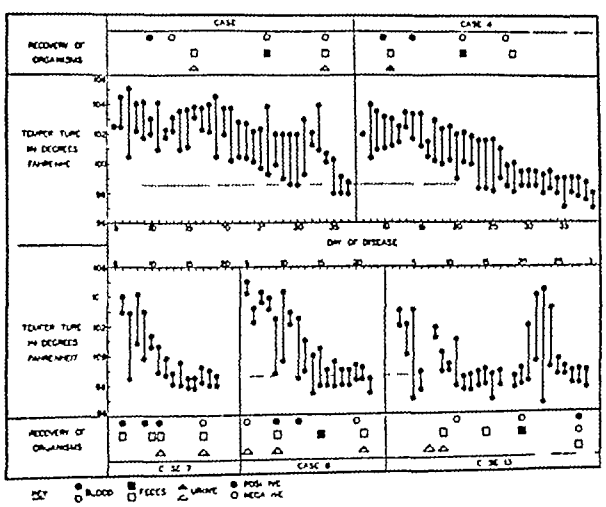

Chart 2.—Five fever charts that illustrate the diversity of temperature response in paratyphoid A and the relation of fever to recovery of the causative agent from blood and feces

Fever was the outstanding single manifestation of systemic involvement in this series of cases Present from the onset of illness in all patients, fever persisted in many for days after subjective recovery Attempts to classify the febrile reactions that were observed for each of these 24 cases brought out the total irregularity of febrile response To illustrate the variations observed in the febrile response of patients to the same infectious disease, the temperature curves of 5 patients are reproduced in chart 2 These temperature charts represent 5 cases of paratyphoid A admitted to one hospital The progressive stair-step rise in fever, said to be characteristically present but infrequently observed in typhoid, occurred in but 2 cases, 1 of paratyphoid A (case 5) and 1 of typhoid (case 22) The febrile reaction at the onset of disease for the remaining cases ranged from an immediate high, sustained fever with a diurnal variation of less than 2 degrees to a septic type of curve with wide diurnal variation Major fluctuations in temperature were accompanied by chills or chilly sensations The height of the fever curve usually was reached in the first or second week

The maximal temperature achieved by each patient ranged from 102.2 F to 105.6 F The temperature in 8 cases exceeded 105 F, in 22 cases, 104 F The duration of fever (99 F or higher by mouth) for each case is given in table 10, the range was from thirteen to sixty-four consecutive days The average duration of fever for 21 cases of paratyphoid A was thirty-three days, as compared with fifty-three days for the 3 cases of typhoid Septic curves continued into the second week for 6 cases but disappeared thereafter except for 2 cases In 1 patient (13) with paratyphoid A a twelve day fever free period was succeeded by return of symptoms with chills and a high septic type of febrile reaction for several days and then by progressive recovery The other patient (20) was acutely ill for ten days, following which he was subjectively well except for a septic type of fever curve that persisted for about forty days The longest continuous fever without remission to normal was twenty-four days Fever in 2 cases (7 and 9) fell abruptly to normal and remained there, whereas the temperature in all other cases became remittent with a progressive daily decrease in the height and duration of fever Only 1 patient (17) had a low grade fever throughout his illness

With very few exceptions the severity of symptoms and toxic manifestations could be estimated by the height of fever and, moreover, the fever curve reflected the patient's physical status Thus the patients seriously ill were limited to those with high fevers In fact, 3 of the most seriously ill patients had high fevers of short duration patient 7, nine days, patient 9, sixteen days, patient 8, twenty-one days

The cardiac rate was noticeably affected in each case, as evidenced by a discordance between pulse and temperature A relative bradycardia became apparent in the first few days of illness to continue for several weeks This was most apparent when a fever of 102 F or over was reached, irrespective of the type of temperature curve It was exceptional for the cardiac rate to exceed 100 Once the fastigium was passed and the patient began to show improvement, an increase in cardiac rate took place to reach during convalescence a relative tachycardia. Minor exertion resulted in elevations to 120 or more. Moreover, varying degrees of neurocirculatory asthenia were common and in 3 patients was so profound as to bring about their evacuation Postinfectious bradycardia was not observed It is of interest that 1 patient (22) at the height of his disease changed abruptly from a bradycardia to a sinus tachycardia at a time when he showed evidence of peripheral vascular failure

One or more manifestations of cerebral involvement was present in all but 1 case Headache was present almost continuously in 19 cases from the onset of illness until the fastigium was reached Thereafter it was present intermittently, to disappear about the time

of defervescence of fever The headache was usually generalized but varied as to localization and severity Temporary relief from headache for 1 patient was not obtained until his increased intracranial pressure had been relieved by the withdrawal of cerebrospinal fluid Further evidence of cerebral involvement was the occurrence of listlessness, somnolence, stupor and delirium Especial care was taken in the separation and tabulation of these manifestations, for each represents a gradation in extent and severity of cerebral involvement Listlessness usually merged into somnolence Stupor and delirium were present in the most severely ill patients Retrobulbar pain was surprisingly common It was present in more than a third of the patients and in 1 was the outstanding symptom Subsultus tendinum was not observed Four patients (2, 7, 8 and 9) presented findings suggestive of encephalitis These patients were ataxic and showed confusion and disorientation which merged into stupor and delirium No signs of meningeal irritation were noted, and the eyegrounds appeared normal Lumbar puncture performed on 3 of these patients revealed a normal spinal fluid in all, normal dynamics for 2 and a pressure elevated to 190 mm of water for the third (patient 7)

Symptoms or signs of involvement of the gastrointestinal tract were prominent Anorexia was present regularly at the height of fever Nausea occurred in a third of the cases, nonprojectile vomiting in a third, abdominal pain in a half and diarrhea in a half The abdominal pain was for the most part indefinite, crampy and nonlocalizing, irrespective of the presence of diarrhea In only a single case did it persist or become sufficiently intense to simulate the pain of an acute abdominal condition The exception was the patient (16) from whom vegetative forms of Endameba histolytica were recovered Diarrhea of several days' duration was a prominent finding It was present on admission in 8 cases, during the first week in 8 and during the second or third week in 5 Blood, excess mucus, severe cramps, tenesmus or the systemic effects of dehydration were not noted Paregoric readily controlled the attacks From the onset of decline in fever and throughout convalescence appetites varied from normal to ravenous Weight that was lost was for the most part rapidly regained

The spleen enlarged sufficiently to become palpable in 70 per cent of the cases This enlargement became apparent in from seven to fourteen days after the onset of illness, when palpation revealed a soft, tender organ with a smooth, round border Transitory hepatomegaly was noted in 2 cases In 1 patient (22) it undoubtedly resulted from chronic passive congestion

Bronchitis was present on admission in 4 patients and developed during the course of illness in another 4 The symptoms were mild and the physical findings transitory in 6 of these patients, all of whom had paratyphoid A The patients had a cough for several days that was distressing at times and productive of a slight amount of mucoid material Two of the patients had a few sibilant rales on each of two days Two patients with typhoid, on the other hand, presented more definite and prolonged evidence of bronchitis One man was admitted to the hospital with a clinical diagnosis of bronchopneumonia Coryza, laryngitis and bronchitis were present A rasping cough, intermittently productive of tenacious sputum, developed in the first week A roentgenogram showed slight pneumonic infiltration at the costophrenic angle, but sputum studies and subsequent chest plates were negative A course of sulfadiazine therapy was without apparent effect The patient continued to cough for several weeks The second case diagnosed clinically as bronchopneumonia developed in a typhoid patient at the height of his illness As it was associated with vasomotor collapse and sinus arrhythmia, it might better be considered as a complication Rapid, shallow respirations and coarse rales developed but were present for only three days Chest plates were negative

Weakness in many appeared early and became more evident as the disease progressed Present in all,

asthenia was profound in 50 per cent of the patients, as indicated in table 7

Excessive perspiration followed chills and abrupt changes in body temperature In addition, however, profuse sweating occurred toward the latter part of the illness when the maximal diurnal temperature rise remained low, and in convalescence It was particularly pronounced in about a third of the patients, who had drenching sweats by day and night

Exanthems appeared early in the disease as a discrete macular rash in about 25 per cent of the patients It was found over the abdomen and chest, sometimes spreading to the axillas and upper part of the thighs It faded on pressure, never was prominent and usually disappeared in from forty-eight to seventy-two hours

The results of 94 leukocyte counts on 24 patients are summarized in table 11 Total cell counts were largely within normal limits The highest (14,700) was recorded during the fourth week of illness and the lowest (3,100) during the second week Several patients showed a mild leukopenia, and in 2 (2 and 24) a definite neutropenia was noted during the fourth week of illness

TABLE 11.—*Data on Leukocyte Counts*

| | Average Leukocyte Count | | | | | | |
|---|---|---|---|---|---|---|---|
| | On Admission | By Week | | | | | |
| | | 1 | 2 | 3 | 4 | 5 | 6 |
| Total number of leukocytes | 6 077 | 6 577 | 6 092 | 5 460 | 6 615 | 7 066 | 7 000 |
| Differential count expressed in percental numbers | | | | | | | |
| Neutrophils | 63 | 61 | 61 | 59 | 56 | 51 | 53 |
| Lymphocytes | 33 | 32 | 37 | 33 | 40 | 46 | 44 |
| Mononuclear leukocytes | 2 | 2 | 3 | 4 | 3 | 2 | 1 |
| Eosinophils | 2 | 2 | 1 | 4 | 1 | 1 | 2 |
| Number of leukocyte counts used to compute averages | 24 | 18 | 19 | 13 | 10 | 6 | 4 |

## DIFFERENTIAL DIAGNOSIS

The illness in each patient of the present series demonstrates the capacity of typhoid or paratyphoid A in vaccinated personnel to simulate during the early stages of the disease a wide variety of illnesses The presenting symptoms of each case are listed in table 5 These symptoms, supplemented by the clinical appearance history and physical findings for each patient, suggested to physicians stationed in four hospitals a wide variety of admission diagnoses These are listed in table 6 according to case number In no instance was the admission diagnosis that of typhoid or paratyphoid A For the most part typhoid or paratyphoid A was not seriously considered until other possibilities had been eliminated The diseases in addition to those listed in table 6, that must be considered in differential diagnosis are brucellosis, dengue fever, miliary tuberculosis, bacterial endocarditis, meningitis tuberculous peritonitis, Hodgkin's disease, trichinosis and other pyrogenic illnesses Obviously it is only through persistent and intelligent utilization of laboratory facilities that a specific diagnosis can be made A history of recent immunization with TAB vaccine offers little assurance that the disease is not typhoid or paratyphoid A Previous immunization may make the diagnosis more difficult by modifying the presenting symptoms and course of the disease as well as by causing atypical Widal reactions

## COMPLICATIONS

Complications occurred in 5 cases In case 23 acute periostitis and osteitis of the right tibia developed in the third week of illness, and of the left tibia in the fourth week Both required surgical intervention Bone fragments and exudate from each focus yielded S typhosa Both foci of infection failed to heal, there being a discharge of purulent exudate and sequestrums at intervals The patient was evacuated for further hospitalization eighty-one days after he was admitted

Patient 21 showed manifestations of vasomotor collapse on the thirty-first day of his illness He developed over a period of hours pulmonary congestion, sinus tachycardia and right axis deviation As there was no evidence of thrombosis or embolism, it was assumed that he had a toxic myocarditis This patient was the most severely ill of all His recovery was delayed to such an extent that he was evacuated on the seventy-fifth day of his illness because of persistent asthenia emaciation and debility

Four patients (6, 7, 4, 13) developed during convalescence precordial pain, effort syndrome and tachycardia They became exhausted by slight exertion Physical examination and electrocardiographic studies revealed no evidence of organic heart disease All these patients were evacuated because of their profound and persistent neurocirculatory asthenia

One patient (1) had evidence of a bilateral ulnar neuritis from the fifth to eighth weeks of his illness Recovery was complete He was treated intensively with vitamin $B_1$

## COMMENT

These 24 proved cases of typhoid or paratyphoid A in military personnel illustrate two accepted but not too generally recognized facts (1) that typhoid or paratyphoid A occurs among immunized civilian and military populations and (2) that the diagnosis of such cases may be difficult Sporadic cases occur not infrequently, but multiple cases are indeed rare There is, however, a recent report of multiple cases in a military population Thus Tullis[5] recorded observations on 7 cases of typhoid or paratyphoid A that occurred in military personnel in Sicily during October, November and December 1943 Five were diagnosed as typhoid and 2 as paratyphoid A The causative organism was isolated from the feces and urine of 1 patient and from fecal specimens of 6 Only two blood cultures were taken, both of which were negative Serologic confirmation of the bacteriologic diagnosis, as determined by the demonstration of a progressive rise in the antibody titer of successive samples of the host's serum, was obtained in only 2 of these cases Serologic studies in which blood from the remaining 5 patients was utilized yielded inconclusive results One patient showed no detectable antibody response, 1 showed a progressive increase in agglutinative titer to a heterologous organism but not to the homologous organism and 3 patients yielded essentially similar agglutinative titers for several antigens As no evidence is presented to show that Salmonella typing serums were utilized in the specific identification of the organisms isolated from the feces of these patients, and as no data are given as to length of incubation in fermentation tests, it is doubtful whether all these cases should be accepted as authenticated cases of typhoid or paratyphoid A in vaccinated personnel The evidence in 2 cases, however, is unequivocal

5 Tullis James L. Typhoid in Previously Immunized Subjects, War Med 7:95 (Feb) 1945

Our 24 proved cases of typhoid or paratyphoid A in military personnel suggested the possibility of a major break in the measures employed to safeguard health in all military units Moreover, since this outbreak of typhoid or paratyphoid A is the first such recorded experience among combat troops in the Pacific, it seemed probable that Okinawa presented some circumstance not previously encountered by our occupation forces Accordingly, an effort was made to account for this outbreak
